To bring this about, a committee was appointed to lay the foundation for a cost plan. This committee finally submitted a cost chart, from which a detailed cost accounting scheme could be made adaptable for the wooden box industry. This cost chart was approved and the subject referred back to the committee to work out all the details necessary to place it before the manufacturers in an understandable and operative form. The committee completed the work and the details for the cost finding and cost accounting plan to be used by the wooden box industry, and as covered by the chart were approved by the Department of Commerce.

The authorized and approved basis for cost finding and cost accounting adopted by the National Association of Box Manufacturers is now submitted for the use of the wooden box industry of the United States. The system is as follows:

It is necessary to take each item separately and analyze in detail the method suggested by which costs are to be determined; also suggestions for accounting, after the individual costs have been secured.

It was held to be essential that a basis should be established in which the factors of costs would be treated, as follows:

Materials charged to the job at cost, and in case of lumber, which is the principal item under this head, carrying charges are to be added. The plan, which is in almost universal practice, is to charge the box factory with the quantity of each grade and kind of lumber delivered to it from day to day, and to compute the number of feet of each grade and kind contained in the product. The difference between these quantities represents waste.

For a unmber of reasons it is impracticable to measure the lumber for each job, because this would involve the handling and measurement of each piece, and consequently entail a prohibitive expense, besides retarding production. Therefore, the usual proceeding of requisitioning exact quantities of material from stores must be dismissed, so far as the production order or job is concerned. The same thing is true of nails, glue, printing inks, and similar materials.

Waste

Waste, as before stated, is charged to the job by percentages derived from statistics which show the results of working various grades and kinds of lumber. It has been customary to use only one percentage for all grades and kinds, but it cannot be too strongly urged to segregate these elements, especially in factories where the variety of woods includes cottonwood, pine, birch, and gum, all of which possess different characteristics.

The percetage of waste is commonly spoken of as being related to the quantity of raw material out of which it develops. The manufacturer must be careful, however, to distinguish between the percentage so arrived at and its application to his product, in which he recognizes only the net feet from which the waste has already been eliminated.

Thus, as an illustration, the following example might be cited:

Material delivered to the factory and used	1,000 feet
100 boxes manufactured, contain	800 feet
Material wasted	200 feet

Percentage of waste, 20 per cent.

Percentage of material in product, 80 per cent.

We will now reverse the proceeding by beginning with the known quantity of material in 100 boxes, and show that the addition of that percentage to the finished feet will not correspond with the number of feet used:

100 boxes contain	800 feet
Add waste—20 per cent.	100 feet
Total material accounted for in cost	900 feet

This is obviously wrong, but in order to dispel any doubt regarding this point, the above illustration is cited. As a standard method of figuring waste into finished product, the following is recommended:

100 boxes contain ..... 800 feet

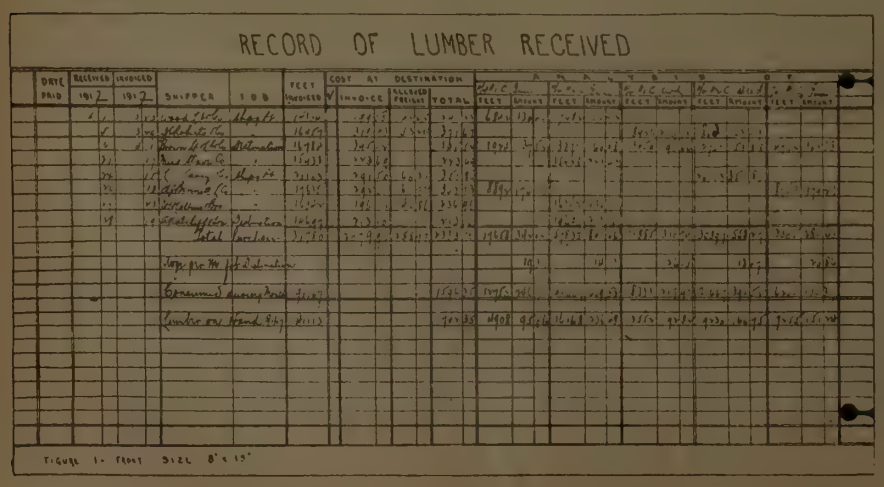
This is equivalent to 80 per cent. of the amount of lumber required;

Therefore, divide 800 feet by .80, and the result is the amount of lumber required, or 1,000 feet.

Productive Labor

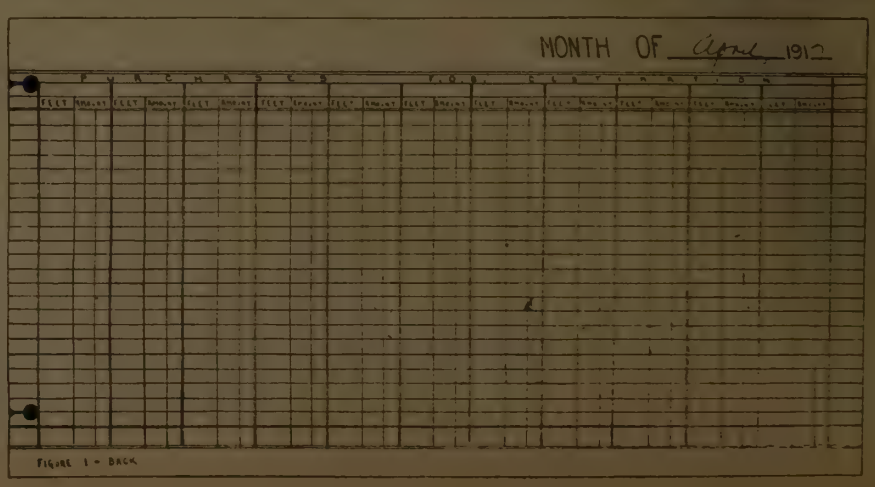
Productive labor charged to the job, as reported from the several production centres throughout the factory. A production centre may be a single workman working by hand, or a single machine served by one or more hands, or a train of machines, each of which performs only a part of an operation, and each machine in the train is dependent upon the other for its output. To illustrate this, the operation of sawing requires two machines served by three hands. The cross-cutting machines saw the pieces to the proper length, while the ripping

* Reprinted from Barrel and Box.



RECORD OF LUMBER RECEIVED

FIGURE 1- FRONT SIZE 8' x 13"



MONTH OF April 1912

FIGURE 1 - BACK

machine takes the pieces so cut and rips them to the required width for each job.

The hourly rate for each production centre is made of the combined rates of the several workmen engaged at it. One of the principal advantages of this plan is that it reduces the number of reports to be handled to a minimum, and places the responsibility of reporting upon the most intelligent workman in each group. In a factory where a great many orders are handled each day, and changes from one job to another are correspondingly frequent, it reduces the pobability of error to the minimum.

Non-Productive Labor

Non-productive labor is a term frequently misunderstood. For the purposes of this plan it is all that labor which is absolutely necessary in the conduct of a factory, and in the manufacture of boxes, but which cannot be definitely measured against each production order, and which must, therefore, be added as an item of overhead or burden expense. Its treatment on the payroll is considered in another paragraph.

Overhead or Burden Expense

Overhead or burden expense is of two kinds, namely, factory burden, which consists of items belonging directly to factory operations, and general overhead, which is expense not directly connected with the factory. Both of these classes of expense in the box manufacturing industry should be absorbed in the process of manufacture, as a percentage of productive labor. There are several reasons for this method of application of overhead charges. It is not very unusual to apply factory burden in this manner, and the method commends itself particularly—first, on account of its simplicity; and second, because the results obtained are as equitable as under any other method. Another reason may be added, and that is that it is not always practicable to allocate all charges entering into this class of expense to the proper departments. As an illustration, the charge for power which constitutes one of the principal items under this head, may be cited. In most box factories power is generated in their individual power plant and transmitted through the factory by way of one main-line shaft. From this main line the several departments are furnished with the necessary power. Numerous attempts have been made to determine the proper charge to each department under these circumstances, but no satisfactory results have as yet been attained. It would seem, then, that, inasmuch as this item cannot be properly analyzed, and that so far as the consumption of power against any item of product is concerned, it rests more chiefly upon the length of time that a product consumes of the entire manufacturing facilities than upon any other factor.

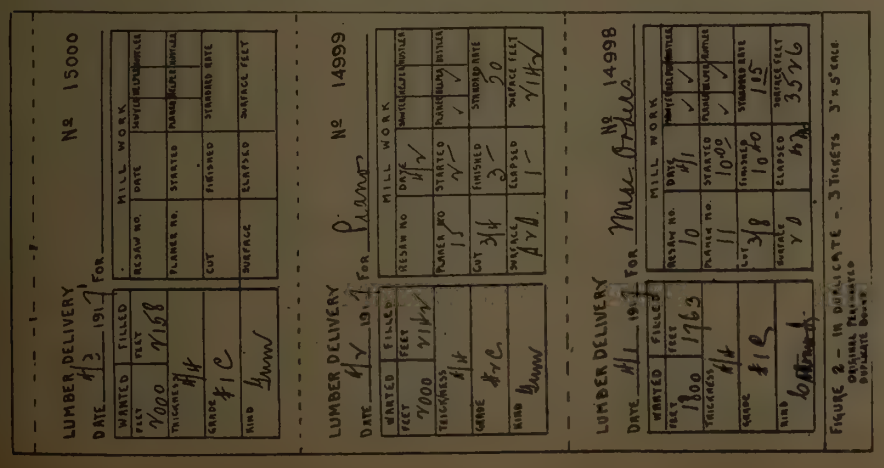
This might be said to be equally true of the other charges constituting factory burden. In proportion to the whole there is very little hand labor in the modern box factory, and the application of an overhead charge against this hand labor, which includes a certain proportion of the power, will not go very far wrong, when compared with the results where a more careful analysis is made.

General Overhead or Administrative Expense

General overhead or administrative expense (as it is called in the accompanying illustration of accounts) is very frequently applied to costs as a percentage of the total factory costs, which include material, productive labor, and factory burden.

In this instance the recommendation is for applying it as a percentage of productive labor.

Material in the box factory is a very variable factor, and should not be used to carry any portion of the overhead. except such as has been already designated as carrying charges on lumber. To illustrate this: A package of large dimensions may require very little labor in its production, while one of small dimensions may entail a great deal of labor. It would be unfair to users of large boxes in that event to allocate burden on a basis of which material is a part. Under these circumstances the user of small packages would not bear the proportion which he should. By applying overhead in the way recommended it



is intended to control the value of box factory products more by the amount of labor that has to be performed upon a given box than by the amount of material passing through the factory, under certain circumstances the quantity of material may vary widely and the cost of labor remain practical stationary.

In the following paragraphs a brief explanation is given of how charges and credits are to be made to the various operating accounts which are illustrated.

Property and financial accounts have not been considered here, because they do not require any special treatment, so far as the principles of cost keeping are concerned.

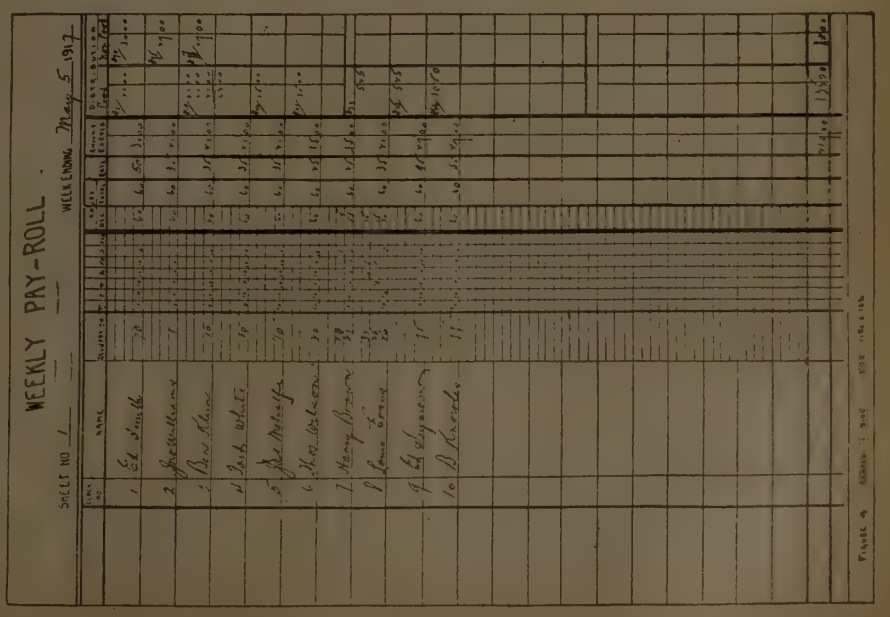
The purpose of keeping the operating accounts as outlined in these pages is to establish a control over the cost records. Into these accounts we will carry entries showing the amounts which have been spent for material, labor, and expense, and the extent to which these have been consumed in the month's operations. In the cost records we will attempt to proportion these outlays to the jobs which have passed through the factory. By a comparison of the two records we shall see how nearly we have accomplished our purpose. If at first we do not succeed in the complete reconciliation of the two sets of figures we shall have at least determined wherein the differences occur, and set about to remedy the conditions which are at fault.

Lumber Account

Upon the careful and accurate treatment of this accounts depends the value of the cost-keeping efforts. If the charges into the account are not based upon careful measurement, and the deliveries from the yard upon at least a very reliable estimate by loads, then there is not much promise of success. These are essentials which should not be overlooked under any circumstances.

The manufacturers who have undertaken such a program, and as a result are able to determine their loss or gain at the close of each month, have felt amply repaid for the additional expense for clerical help which a careful analysis of this account and those described in the following pages has occasioned.

Charges to the lumber account are made at the close of each month from the lumber purchase journal. This record is illustrated in Fig. 1. The sheet as drawn shows only five columns for the analysis of pur-



chases. Where this is not ample, then the reverse side of the sheet may be filled entirely with similar columns and used in folio form. Or, if an even more elaborate analysis is desired, a separate sheet for each kind of lumber may be used throughout the month, and the totals from each recapitulated at the end of the month for journalizing. It will be seen to possess such flexibility as to make it adaptable under any conditions.

The journal entry from the lumber purchase journal would appear as follows:

Debit: Lumber	$2,338.70	
Credit: Accounts payable		$2.079.93
Accrued feight		258.77

Cost of 131,780 feet of lumber during February.

No entry has been made in Fig. 1 for freight on shipments purchased f.o.b. destination. Inasmuch as these charges are a deduction against the invoice of the shipper they should be charged to the shipper's account. Freight charges on shipments purchased f.o.b. shipping point should be entered against the respective shipment in this record as soon as they are ascertainable, and, when paid, be charged to the "Accrued Freight Account."

The entries for lumber consumed and lumber on hand need not be carried into this record, but may be transcribed to a separate sheet, which may be made to carry a detailed history of the lumber account for an entire year.

A sheet for this purpose should have the following headings:

JANUARY, 1917.

Kind. Thickness. Grade. Invty. 1st. Purchased. Consumed. Invty. 31st.
Ft. cost. Ft. cost. Ft. cost ft. Cost per M.

and continued across the page until the entire year has been recorded.

Entries are made into the lumber purchase journal in chronological order of receipt. Another word might be added regarding the distribution of freight charges into the analysis of purchase columns. The simplest plan is to ascertain the cost of freight charges per 1,000 feet, and to distribute this to the several items in an invoice in the porportion which each item bears to the whole.

Having provided a suitable record for the history of lumber purchases, we are next concerned about the proper reporting for the disposition of this material.

The form shown in Fig. 2 has been employed for this purpose with success. It is issued by the yard foreman in duplicate. The original, which is perforated, is given to the tally-man; the carbon copy remains in the book to facilitate tracing in the event of the original being lost. The yard foreman fills in the approximate quantity wanted, description of the lumber, where to be delivered, and the mill work to be performed. The tally-man inserts the number of feet loaded, and places it in a pocket provided on the lumber wagon for this purpose. When work is commenced in the mill on this load of lumber the machine operator fills in the time of starting, and, when finished, the time at which the work was completed. He then passes the ticket on to the box factory, where these are picked up daily by a clerk, who at the same time marks the truck-load or parcel of mill-worked lumber with the thickness, grade, and kind. This facilitates the proper reporting by the sawyer of the description of lumber worked. These tickets, upon reaching the office, are sorted first, as to thickness, grade, and kind, for the purpose of making the monthly report of lumber consumed, and then sorted as to the different kinds of millwork done, for the purpose of establishing a cost on the several operations which have taken place.

Entry is made at the close of the month for the number of feet of each thickness, grade, and kind of lumber consumed. The prices to be applied to this consumption are arrived at from detailed history of the lumber account.

After these entries have been made, unless other sales have taken place which have not been gone into in this paper, because the treatment of these would be very similar, the balance in the lumber account should show the total number of feet of lumber on hand and its value.

How accurately this work has been done can be determined at the time of taking a physical inventory. After having this plan in operation for two or three months it might be well to take a physical inventory to verify the book figures, and, if the results are not entirely satisfactory, to repeat the same proceeding several months later. It would be a safe prediction, however, that after everyone who has had any part in the reporting of lumber received and lumber delivered has become thoroughly accustomed to its use, the necessity for a physical inventory will not present itself more frequently than once a year.

In the interim the manufacturer will have had the advantage of keeping thoroughly posted on the condition of his lumber stocks from records kept in the office, and it will not be necessary for him to depend upon the opinion of the yard foremen.

Lumber Yard Expense

This account is to comprise all of those charges which enter into the maintenance of a lumber yard, and consists of labor consumed in unloading and piling and delivering to box factory, tram, and foundation repairs, repairs to other equipment used, and the necessary fixed charges.

Under the heading of fixed charges the principal items would be rent of ground occupied by the yard, or its equivalent, and insurance on lumber.

All of these items are necessary expenses which should constitute an additional item of cost against lumber. For the purpose of simplifying the pricing of lumber as much as possible, however, these items of expense have been eliminated from the lumber account. Another purpose of separating this expense from the prime cost of lumber at the plant is to determine the asset value, or inventory value, of the carrying charges on the stock of lumber remaining on hand. The cost per 1,000 feet is arrived at by dividing the total expense for the month by the number of feet purchased. The account is credited at the end of the month at the rate so arrived at, multiplied by the number of feet consumed. In the succeeding month the balance carried over is to be added to the monthly expense and the total divided by the number of feet on hand at the beginning of the month, plus the number of feet purchased. This establishes a new rate for that month's consumption. This method is particularly adaptable to plants where the receipt of lumber is heavier during some months than in others. As an illustration: A plant located in Chicago receives most of its lumber from points on the Great Lakes during the summer. It would be unfair to burden those months with that expense. Under the plan suggested, the expense would not be absorbed until all the lumber had been consumed, which seems to be more equitable. The amount chargeable to the monthly operatons is charged to the box account.

Planing Mill Account

The next step through which the material passes is that of millwork. It is therefore desirable to know how much expense has been incurred in this operation. At the close of the month the charges made to this account are transferred to the box manufacturing account. Using the number of feet of lumber consumed, the entry will show the cost of resawing and surfacing lumber.

In the paragraph on lumber the suggestion was made to keep a record of the different kinds of millwork done. the quantities produced in the several operations, and the time consumed on each. Where this has been done, a cost on the different kinds of millwork can be arrived at.

To illustrate this the following hypothetical case is shown:

Work done.....	429,648 ft. resawed 3/8 in. and S2S in 286 hours	
	154,714 ft. S1S to 7/8 in. in 80 2/3 hours	
	584,362 ft.	
Cost of labor in mill	$340.62	
Cost of overhead	320.62	equals 94.1 per cent.
Total	$661.24	
286 hours resawer and helper at 55c per hour		$157.30
286 hours planer and helper at 50c per hour		143.00
Total		$300.30
94.1 per cent. overhead		$282.68
Cost of resawing and surfacing 429,648 ft.		582.98
Cost per M., $1.36.		
80 2/3 hours planer and helper at 50c		$40.32
94.1 per cent. overhead		37.94
Cost of surfacing 154,714 ft.		$ 76.26
Cost per M., 50c.		

Charge to Box Account

429,648 ft. at $1.36 per M.	$582.98
154,714 ft. at $0.50 per M.	78.26
Mill work done in January	$661.24

Supplies

This account should be charged with the purchase of all those supplies which become a tangible part of the product. This would include nails, glue, fasteners, ink, twine, shingle bands, trimmings, and similar items. The account would be credited at the end of each month with the consumption of these materials. In a plant where the variety of articles used is not too great a columnar record similar to that shown in Fig. 1 may be used for the classification of these different materials and the totals journalized at the end of the month. Where this is found to be impracticable, the use of a stores record card (Fig. 3) is recommended. By this means a record may be kept of each article ordered, placed in transit, received and consumed. Through an oversight, the price column was omitted, but plenty of space will be found in the "Received" column. Entries are made into the "Ordered" column at the time of placing the order. Into the "In Transit" column when shippping notice is received. Entries to the "Received" column

are made from the invoice at the time of passing it for payment, and to the "Consumed" column from the daily reports of the storekeeper, or other employee, in whose custody these materials are kept. At the end of each month the totals of every article used are drawn from the "Consumed" column, and are extended at the prices shown on the stores record card.

When these transactions have been faithfully recorded, and the total debits and credits posted to the supplies account, the balance then remaining will represent the value of materials on hand. By drawing the balances from the stores record cards at the close of any month the total so arrived at should equal the balance in the supplies account.

Pay Roll Account

Charges are posted to this account at the close of each pay period, whether weekly, bi-weekly, semi-monthly, or otherwise, and the total represents the sum of all money expended for wages during the month.

Where a weekly payroll exists there is invariably a portion of the week which belongs in one month, and the remaining in the succeeding month. It is necessary that the operating accounts be charged with the amount of labor accrued during each calendar month, so that this item of cost may be in proportion with the items of expense and revenue which are readily ascertainable by periods of a calendar month. For this reason it is necessary to make the labor distribution for a like period.

In Fig. 4 a form of payroll sheet is illustrated which lends itself readily to a division between productive labor, non-productive labor, lumber yard expense, planing mill, power, teaming, and such other departments as are maintained.

Where the terms "Productive Labor" and "Non-Productive Labor" are used they refer exclusively to box factory labor. It will be seen that four spaces are provided for each name on the payroll, in which the several classifications might be made. If the payroll is a weekly one, this distribution should be completed at the close of each pay period in the columns provided at the right hand side of the page. The recapitulation of the totals so established will provide the information for the journal entry by which the payroll account is credited and the various operating accounts charged.

For the last pay period of the month, when it does not end simultaneously with the month, two distributions are necessary—one for the time up to and including the last day of the month, and one for the number of days beyond that date.

That part of the pay which runs into the succeeding month is not to be journalized until the books for the previous month are closed. The balance then remaining in the account will represent that part of the month's wages which was not paid until the succeeding month, and will stand as a liability upon the books.

(To be continued.)

Canadian Forester Joins U. S. Engineers

Mr. W. N. Miller, formerly of the Faculty of Forestry at the University of Toronto, recently enlisted with the United States army and was assigned to the position of captain of Company A, 10th Engineers, United States National Army. In a letter received from Capt. Miller, he states that he is about to leave for France in a few days, with the American Expeditionary Force and that, along with several regiments of pioneer troops, they are to prepare materials for docks, warehouses, railroads, and cantonments for the American troops at once, and that the order calls for aproximately 140,000,000 feet B.M. of materials of all kinds. Apparently, therefore, the engineers of this expedition will have a substantial task ahead of them. Capt. Millar's extensive experience in forestry work, both in the United States and Canada, will be of great practical value to him in his new work.

The entire equipment for the Tenth Engineers (Forest) was purchased in less than thirty days, and includes sawmills (complete in every detail), tractors, trucks, log wagons, trailers, miles of logging railroad steel, log cars, electric light plants, miles of piping, and tons of supplies. The mills that are to be taken to France are of three types: (1) 40,000-foot capacity, (2) 15,000-foot capacity, and (3) 5,000-foot capacity. They are practical, serviceable, compact. The idea, it must be borne in mind, is to get lumber at all sacrifice, and the mills have, therefore, not been built along lines of economy.

The largest type will have a ten-hour capacity of 20,000 feet; however, these mills are to be run double shift. They are of the rotary type, with rope transmission, equipped with an edger and two cut-off saws. They are as strong as can be made, yet retaining the portable features.

The second, or intermediate sized mills, have portable boiler, with engine mounted on top. They will be capable of cutting 15,000 feet in ten hours.

The smallest type of mill to be used will be capable of cutting 5,000 to 6,000 feet. It is claimed that these little shavers can be set in ten minutes and changed in twenty minutes. They will follow the cutting.

Trade Ethics in Millwork Distribution

By L. C. Boyle*

The wholesaler owes an unquestioned duty to the retailer. The retailer also is under an obligation towards his wholesale associate. In its final analysis both interests are bound by immutable ties.

1. Dealers' Co-operation.—Every dealer should be a member of his regional association, and this that he may the better improve his merchandising methods and educate himself for more efficient public service.

In addition to the larger co-operation afforded through state associations, every community should have its local organization. Elbow-touch among competitors tends to eliminate unfair trade practices, and, above all, constructive opportunity is thereby given to study not alone the wholesale market, but the service overhead. Accurate knowledge and general understanding of cost is the legal route to fair prices and market stability. Uniform methods of cost accounting are as essential to the retailer as to the manufacturer; the uninformed dealer is, as a rule, a price-cutter.

II. Wholesalers' Co-operation.—If it is important for the dealers to associate for the more efficient study of their trade problems there is far greater need of co-operation among manufacturers and jobbers. Elimination of waste in manufacturing and distribution processes can be achieved solely through organization. The wholesaler who does not recognize this fact not only stands in his own light, but, in truth, throws a sinister shadow on any effort to relieve the industry of its economic errors.

In addition, if both branches were constructively organized, legitimate opportunity would develop for frank and open discussion touching such subjects as "trade ethics." The law's prohibition in no wise seeks to obstruct that form of co-operation which tends to overcome industrial handicaps fairly. The law, however, does inhibit the artificial result achieved by agreement, where the purpose is to restrain or monopolize trade channels. Individual initiative must be left free, but the understanding of competitors can be enlarged as the result of co-operative contact. Through lack of industrial co-ordination national wealth has been shamelessly wasted. Hereafter the vague excuse of the law's menace will not justify waste and disorganization. The spirit of the hour is constructive. Price-fixing is destructive, as it in no wise adds economic efficiency. Knowledge of industrial facts, however, is essential if we are to get in line with the nation's forward movement. To accomplish this result we must study the problem jointly.

Wholesaler Deserves Dealer's Co-operation

III. The Duty of the Retailer.—The dealer should recognize the legitimate wholesale millwork distributor as the source of his supplies. Broadly speaking, the right solution of this phase will solve much of the trade difficulty. If the retail merchant expects fair trade dealing from his wholesale ally he must, in return, manifest a reciprocal attitude. There is at the present time a growing disposition on the part of the dealers in some sections to unite in co-operative buying schemes as to millwork products. The movement is not justified on the ground of economic buying. This new departure is the converse of the claim of the mail order house in its drive for the dealer's trade. Those who have given close thought to the mail order problem are convinced that in legitimate competition such concerns cannot ultimately win out as against the local retailer, and this because of the basic economic elements involved. As to co-operative buying, however, aside from the question as to the wisdom of the course, production, assembling and distribution cost must be as great in this new scheme as in the well-ordered process of long-established and modern plants. The new plan may make a surface showing by living on its own fat for a while (stock sale money derived from the retailers), but ultimately the basic element of cost will demonstrate the fallacy of the claimed advantage.

If the scheme takes root and spreads, the result is bound to be disaster to retail interests, and this because wholesale millwork operators will be driven to direct distribution.

Once this entering wedge is adopted as a trade necessity the mail order method will find lodgment in every avenue of wholesale distribution, because of the law of self-preservation. The public will not be benefited, because of the added cost of distribution, whereas trade interests as they now stand and are recognized will be fatally disturbed. Surely the better course is an intelligent grasp of the problem by the millwork and retail interests. This end can be attained solely through the co-operative spirit.

Why should not the two interests come in closer and more sympathetic contact? The law in no wise prohibits such a course when the purpose is not to interfere with trade channels. Both classes, in a general sense, are cursed with the bad habit of bickering, fault-finding, crimination, and recrimination. We can get nowhere by this method. The fact is, the whole problem is one of mental attitude.

Let's cut out the small and narrow way and adopt the broad and helpful course. In other words, the square deal will settle every dif-

* Continued from previous issue.

ference. To me it seems the very limit of folly for the dealers, directly or indirectly, to go into the wholesale business. By such a course the competitive element in both fields will be accentuated; the dealer in the wholesale market, the wholesaler in the dealer's market. We need less, not more, competition. If wholesaler and dealer would approach each other's problem with open minds, error and injustice would disappear. Have a committee of dealers study the market problem of the the manufacturers and jobbers. Also let the manufacturers and jobbers understand more fully the dealer's problem. If both sides were actuated by the right spirit, every tangle would unravel, and this without the illegal trade agreement or understanding.

In making these suggestions I am quite sure that my retail friends, who are in large measure also my clients, will understand that I am actuated by no selfish motive, but am trying to serve a constructive purpose.

IV. The Wholesaler's Duty.—The wholesaler should recognize the dealer as his natural ally in distributing mill work to the consumer. In addition to the basic principle suggested, the wholesaler should realize that in its ultimate analysis the growth of mail order methods holds as subtle a menace to the wholesale interests as to the recognized retail distribution. Herein the public is to be considered. It is up to the dealer to justify his cause by efficient, economic, and up-to-date merchandising methods. The mail order houses are expert advertisers. Quality and service considered, however, the local dealer gives more value for the money than does the mail order concern. Also he is on the job to meet every need; he knows the meaning of grades and has trade character. It is up to the dealers to unite and educate the buyers. Advertise. In this effort the wholesaler should aid in every legitimate way possible. He should support, not weaken, his co-worker. The two branches have, in a sense, partnership interest; that which cripples one weakens the other.

V. Stock.—As to "stock," the problem is not complicated. The legitimate and economic method of distribution is through the dealer. The element of barter is the fly in the ointment. The theory is too deeply rooted that goods cheaply bought are half sold. As with lumber products, the outstanding need of the wholesale stock market is stability. A fair profit to the wholesaler and no dealer receiving an undue advantage over his competitor! Here, again, the true understanding of wholesale costs and an honest purpose to live and let live is all that is needed. That the competitive situation is such as to prohibit unreasonable wholesale prices must be apparent. The dealer who, in the name of business thrift, drives hard bargains simply stands in his own light. He gets no advantage even over his competitor by such a course, and with certainty encourages the wholesaler to poach whenever and wherever opportunity offers. If the "volume" bug could be eliminated from the mind of the wholesale distributor and selfishness in buying, on the part of the dealer, recognize its own folly, all would be well. Get together and study each other's problems.

Increase in Cost of Millwork Supplies

	Per cent.
Packing lumber	43
Door stock	18
Sash stock	21
Shop pine lumber	23 to 28
Yellow pine lumber	28 to 32
Veneers	23 to 40
Window glass	54 to 75
Plain plate glass	107
Freight on glass	5
Glue	100 to 300
Sandpaper	21
Coal	80 to 100
Nails, sash dowels, etc.	46 to 50
Frame pulleys	20
Wages	15 to 25
Shop supplies	25
Birch lumber	8 to 10
Oak lumber	13 to 15
Basswood lumber	20 to 25
Gum lumber	10 to 25
Building paper	12
Sash cord	50
Sash weights	25
Stationery	50
Office supplies	25
Machinery	25
Screen wire	75 to 100
Oils, varnishes, and stains	25 to 250

Do retailers consider these facts when driving hard bargains with the wholesalers? Live and let live. Educate the public.

VI. Special or Odd Work.—When we come to consider special or odd work there is presented a complex and difficult business problem. Although the equitable principle comprehended by the phrase "trade ethics" applies to every phase of the industry, to retailer as well as wholesaler, it is most frequently invoked in reference to the distribution of odd work.

This class of products is not carried in stock, and the service of the dealer is truly of the agency character. The capacity of the dealer to serve his wholesale principal in this specialized field is unquestioned. There is, however, a natural limit to this capacity to be of practical help. Just what this limit is must be determined by the custom and practice of localities. Good sense and fair play must aid if the problem is to be helpfully solved.

The wholesaler who sells direct simply because a dealer in a given community handles the product of some other wholesaler commits a trade blunder. The fact is, the whole situation would be aided if dealers were to select their wholesale principals and stick to them. Through such course the hard lines of the competitive strife would be modified and trade justice more thoroughly achieved.

In the same spirit that dealers urge the wholesale class not to give aid and comfort to mail order competition, the wholesaler has the relative right to insist that the dealer enter into no selfish alliance with the small local mill. The line of cleavage is definite; the mutuality of interest certain. The dealer who is careless of his wholesale partner's trade interests simply sows the thistles of discord. The wholesaler who goes over the head of his local representative invites reprisal.

For years custom fixed five hundred dollars as the limit of the dealer's right to particpate. Improved and changed conditions have doubtless created a situation wherein this limit in justice should be raised. The problem will not permit of solution by co-operative agreement, and this because of the law's prohibition. In other words, an artificial status cannot be created. Where custom in this new environment has developed a satisfactory status it should be faithfully observed. Where discord prevails, the wholesaler, through individual initiative, should squarely meet and solve the problem. Stability and harmony, grounded in justice, in no wise offend the law.

As suggested, an artificial status cannot legally be created. Individual initiative must be preserved. What is a fair figure beyond which the dealer cannot logically serve his wholesale principal is a matter for each millwork producer to settle in his own mind; but in so determining, equity and justice to the dealer should control.

A number of wholesalers have indicated that from $1,000 to $1,500 is the marginal limit within which the dealer can usefully serve. I make no claim of being able to indicate the amount, even if such a course were proper. However, if the suggested range of figures ($1,000 to $1,500) is just to the trade, and will in no wise burden the public, there is no reason why individual initiative should not adjust itself to such a limit.

VII. Line Yards.—The line yard that indulges in jobbing practices creates a situation wherein it invites trade piracy. Taking advantage of opportunity to profit when out of line with well-established trade channels, not infrequently acts as a boomerang. Remember this: The other fellow also has an investment; he performs a real trade service; you need him; the public needs him. Why throw a wrench in the wheels?

As indicated at the outset, I make no claim to mastery of the complicated trade problems here involved. All too frequently the law, as interpreted, is a stumbling block in the path of industrial progress. This result, generally speaking, is due to a lack of grasp of the facts. Sure it is that no legislative body would deliberately cripple business operations. As to trade statutes, the purpose was and is to relieve industry of artificial restraints that tend to burden the public. This, however, does not prevent those engaged in a given line from correcting, by the open, co-operative method, economic error. It is in undertaking to achieve this helpful and legal result that a correct grasp of industrial facts is essential.

A word in conclusion. Both the wholesale and retail operation are fiercely competitive. The over-supply of competing units reduces the element of profit to the minimum. Service requirements are exacting and highly technical. The legitimate trade interests of both wholesaler and retailer are bound by common ties. No industry holds more vital relation to public welfare. The public must be adequately and reasonably served. This service is best performed through the medium of a well-ordered industry. The price-cutter is a blunderer and a marplot. In the final analysis he serves no other than an evil purpose. The outstanding need is a frank and honest recognition of the trade difficulties to be solved and the courage to do right. Each side in its inner conscience knows the equity of the situation. Let those who have the vision to follow the straight road stand together—the slackers will soon make their presence known, because the type has common earmarks and is universally yellow. The solution cannot be achieved through agreements written or subtly devised and understood. The only way is the open and constructive course.

We live in a tragic hour. Mighty forces are moving under the surface the world over. Throughout the land there is an awakened spirit. On every hand industries are putting their house in order, not alone that they may respond to the national need in this grave hour of dan-

ger, but that they may the better co-ordinate their processes when the period of readjustment comes. Government itself is not dealing with the individual, but rather with the industrial group. Co-operation is recognized as essential. The grave question we must answer to ourselves is this: Have the wholesalers and retailers in millwork products the vision, grasp, and understanding so to organize their separate fields that efficiency, economy, and public service will dominate their process? Can the two interests lay aside the petty and unworthy and cooperate constructvely along lines that will tend to build up and strengthen?

These results can be achieved solely through the application of the "square deal." He who so orders his conduct is contributing his bit, whether it be in a small yard in some distant village or within the four walls of a great factory.

Not Much Activity in Spruce in Great Britain

The Timber Trades Journal of London, England, in a recent issue, discussing the spruce market, says:

"Several weeks have passed since the concessions were made in the American trade, but still we hear of very little movement. It is the old story—freight and charges are too high, and the business is not worth doing. Glad as producers in America would be to do a little export trade in wood, they have a better home demand than usual for their goods; the cost of the production has been high, and they cannot make such reductions in price as will meet the situation on this side. Nothing, indeed, but a change in the shipping position will have much effect. As regards deck loads on steamers, some small parcels will probably be arriving shortly; but, as our Liverpool correspondent remarks, the government concessions are of a very negative sort, and will need to be extended if any appreciable quantity of wood is to come over from America this year."

A number of interviews with leading English importers are also published by the same journal, one of which, by Mr. Edward Price, of the firm of Price & Pierce, is representative of all the others. Mr. Price said:

"At present the Canadian trade would not be materially increased by the relaxations. While the increase in the maximum prices was helpful, the high rates of insurance for war risks prevented business being possible. While 5 or 6 per cent. was formerly the war risk, today it was as high as 50. In addition to this, the ships all wanted freight paid in advance, and insurance had to be paid on that, too. The price, in these circumstances, with the heavy extra charges, made business impossible, as the cost exceeded the limit of prices. "There is another difficulty," continued Mr. Price, "and that is that, even if we were prepared to do business on these unsatisfactory lines, we cannot get the tonnage.

"The proffered deck accommodation practically amounts to nothing. Ships are laden with munitions or grain down to the load line, so, while the decks are free, nothing can be carried on them. Such deck accommodation as may be available will probably be used for the shipment of government timber A little timber may come over in this way, but very little. The ordinary trade is dead. Last year at this time we had some 100,000 tons on the way here; this year we have none.

"A curious deadlock has arisen lately, when two British sailing ships laden with pitch pine put into Halifax, where they are lying still loaded and awaiting the government's permission to proceed to their ports of destination in the United Kingdom. We have sold the cargoes, but cannot deliver the goods. But this is only one of the many difficulties we have to contend with."

Quebec Cullers' Report

The following comparative statement of timber measured and culled to date is furnished by the Quebec Supervisor of Cullers' Office, under date of September 5:

	1915. Cu. ft.	1916. Cu. ft.	1917. Cu. ft.
Waney white pine	395,120	140,160	85,880
Oak	104,960	286,960	90,600
Elm	46,840	69,440	105,960
Ash	840	1,680	320
Butternut	.....	40	.....
Birch and maple	48,880	46,880	15,880
Pitch pine	.....	.....	41,230
Fir	.....	.....	36,490

During the year ended 30th June last the Laurentide Company, Grand'Mere, P.Q., earned the largest profits in its history. The net earnings totalled $2,220,000, an increase of $976,377, of which $1,841,981 was derived from the mills, $253,627 from lumber, etc., and $125,050 from investments. After deducting bond interest, depreciation, and profits tax, the net profits amount to $1,720,011, a gain of $782,189. A large portion of the increased profit was derived from the sale of pulp products.

Ten More U. S. Forest Battalions Authorized

The formation of a second "Forest" regiment comprising ten battalions and composed of lumbermen and woodworkers, who will go to France and get out of the forests materials for the use of the American, French, and British armies, has been authorized by the U. S. War Department. Two battalions are to be raised at once with the active aid of the Forest Service of the Department of Agriculture. It is expected that the remaining eight battalions will be called for in a short time. Nine "service" battalions, made up of laborers who will be used in connection with the Forest regiment, have also been authorized and two battalions have been ordered raised at once.

In order to provide for future contingencies it has been decided to commission at the present time enough officers for other battalions yet to be raised. Those men not needed now will be placed on the reserve, and will be called as the other units are formed. According to the present plan, fifty per cent. of the officers will be sawmill and logging operators, twenty-five per cent. will be technical foresters, and twenty-five per cent. will be men with military training. A number of the graduates of the engineer camps have been selected for service with the new units. Each of the ten battalions of the second regiment will comprise three companies of 250 men each, and will be under the command of its own major.

No Strikes to Hamper U. S. Ship Construction

An agreement was recently reached between representatives of the United States Navy Department, the Emergncy Fleet Corporation, and the American Federation of Labor providing for rapid and peaceable adjustment of all labor disputes in shipyards throughout the country, in order that the work of ship construction in public and private yards may continue during the war without danger of serious interruption. The agreement calls for the immediate creation of an adjustment committee consisting of three, four, or five members, according to the nature of the particular case under consideration. The President has appointed the chairman of the commission, and Samuel Gompers, president of the American Federation of Labor, is to name the second member. A third member will be named by the Emergency Fleet Corporation.

Busy Times at Thessalon

For two months or more the Thessalon River has carried to Lake Huron hundreds of thousands of logs of all sizes and descriptions, says the Algoma Advocate, of Thessalon, Ont. Early in the season came logs, cut to certain measure, for pulpwood. From bank to bank the surface of this giant stream was carpeted with them. Week in and week out, night and day, this pamorama of wealth swept hrough the town. Then for a time a different class of timber monopolized the waterway, and it was railroad ties in never-ending procession that wobbled, squirmed, and bobbed their journey to Lake Huron. Now it is pine logs for the big mills, some of them great giants of the forest, miles upon miles of them that are hurrying to the lake to be chained together in booms and piloted by tugs to the manufacturing centres in Canada and the United tSates, to be made into ships, houses, furniture, coffins, and cradles. This seems a primitive method of transportation to the uninitiated, but railroad trains would be puny, indeed, tackling a job so immense.

Putting an End to Theft of Logs

The Cleveland-Sarnia Saw Mills Company, Ltd., have had a great deal of trouble for a few years past on account of residents converting to their own use logs belonging to the company which had broken loose from the company's booms. In the end the company prosecuted five residents before the magistrate at Chatham, and all of them pleaded guilty and made restitution, amounting to some $200, together with expenses and court costs. Sentence was suspended in each case.

Closing Down Pacific Coast Mills

A report from Seattle, Wash., states that lumber manufacturers and logging operators throughout the Pacific Northwest have unanimously decided to stop all operations for at least four months, or until after the beginning of 1918. It is stated that the shutdown is not due to the strike of employees, but rather the result of a depressed market. The shutdown does not include shingle mills.

The British Columbia Lumber and Shingle Manufacturers' Association have agreed with the Canadian Pacific Railway to load all cars to their full capacity, on the understanding that the railway company will not put a requirement to this effect in their tariff.

Hon. J. D. Connolly, agent-general for Western Australia, recently arrived in Vancouver on a visit to Canada to make enquiry on behalf of his government into the timber industry.

Timely Advice About Slash Disposal

By R. O. Sweezey

Very soon legislation may be expected in Eastern Canada requiring some form of slash disposal by logging operations. That is as it should be; but first we should look for some other more urgent ameliorations in the form of properly developed systems of fire ranging. Meanwhile, blind-stabbing at slash disposal may attract attention, so let us be on our guard and act intelligently when we do tackle the question.

Recently there have been published several references to this question, and in these there have been indicated certain methods as worked in a few localities of Western Canada and in the United States. But while cost data on these and other experimental efforts prove interesting, we must be careful not to base upon them our calculations of cost for slash disposal in Quebec and Ontario. The forests of Western Canada differ greatly from those of Eastern Canada where, instead of comparatively clean forest floors, as prevail in Western Canada, our Eastern forests are littered with underbrush, fallen trees, and dead or dry tamarack, providing such impediments to ordinary operations that the problem of slash disposal, unless it includes disposal of these obstacles, would not be half solved.

Besides, there are several important features that should be considered in regulating the disposal of slash. For instance, in the operation of the extensive black spruce flats of Northern Ontario and Quebec, that are so characteristically wet and swampy, the same care and expense need not be adopted as would be advisable on dry slopes or hills such as predominate in the sandy areas of the St. Maurice Valley, in the Province of Quebec. Then there is the obvious necessity of brush disposal in proximity to railroads. Indeed, every locality has its peculiar menaces, and these should be met according to their nature, but not advisedly by rigid rules designed to meet certain conditions that may have forced themselves more prominently upon the attention of the law-makers. It is flexibility that we should have in this.

Disposal of brush in some form seems desirable to remove a fire menace, so let us get at the menace in the proper way. For, should legislation be imposed and rigidly applied with wooden-headed adherence to a formula that fails to support the proper elements, we shall find loggers obliged to labor unnecessarily in places obviously not menaced by reason of local conditions. Irritating and exasperating severity might well be conceived that would bring forth contempt and condemnation for the regulation. There has been far too much said against the so-called "practical lumbermen" by those recently raised to pedestal prominence by reason of forestry school education. We wish in this country to benefit by the extraordinary good sense and keen judgment of the lumbermen, and these men can tell us that brush disposal, like many other questions of forestry and logging practice, may be made a fool of by improper application in doses that would be dangerous instead of remedial. Now, as common sense would suggest starting with small doses of this remedy, we ask ourselves where is the greatest menace that we seek to remove? At once the lumberman will say that slash is most dangerous where people are wont to pass back and forth or to make their abode. In other words, it is along railroads and river or lake fronts, or in the vicinity of logging camps that slash provides the greatest menace following a winter's operations. No one is interested in "monkeying" around old choppings in the interior, but along rivers, lakes, and railroads we find river drivers, prospectors, and hunters, who stop anywhere to camp or cook their meals, and if a log camp is near by, curiosity is usually keen enough to lead the passer-by to peep inside or prowl aroung, long enough, perhap, to throw a lighted match or cigarette butt carelessly into the heaped-up dry brush or into the piles of chips that litter the surroundings of every log camp. Let us, then, apply our first efforts at brush disposal in these menaced localities, namely, the highways of the forest. Merely a narrow strip properly cleaned, at small cost, will be sufficient to remove a great danger; and, having done this successfully, we can figure on further extension of efforts.

A canvass was recently carried out among the lumber camps and mills north of Everett, Wash., to find out how many employees could be counted upon for getting out contracts for material for the government, and it was found that there were at least 5,000 loyal workmen ready at any time. It is now stated that the threats made by the I. W. W. to call a general strike unless members of its organization are at once released from jail will not affect the lumber situation.

Model Logging Camps

The Schroeder Mills and Timber Company, a corporation allied with the John Schroeder Lumber Company, of Milwaukee, Wis., is operating extensively in its timber limits along the Pickerel River, in Blair and Mowat Townships, Parry Sound district, Ontario. The company is employing 750 men there in getting out white pine logs, and it will this winter log about 25,000,000 feet, which will be disposed of to mills in the Georgian Bay district, as in past seasons. The company believes in making everything attractive to its employees in the woods, and has constructed seven model camps. Each camp is provided with bath houses, reading rooms, moving picture shows, and other conveniences and amusements that have been hitherto unheard of in the Northern logging territory. The Shantymen's Christian Association, a Canadian welfare organization, with headquarters at Toronto, is contemplating the erection of buildings at these camps, and will greatly aid the company in its improvement of camp conditions. Another company owned by the John Schroeder Lumber Company is the Northern Pacific Logging Company, which is operating two camps on Greenway Sound, Broughton Island, Vancouver.

Lumbering Industry Shown in Movies

Dr. D. E. Diemer, of the United States Forest Products Laboratory, is having moving picture films prepared of the logging and lumber manufacturing industry in the United States, showing the various stages from the felling of the tree to the plowing of a cleared field in dstricts where cut-over land is cultivable. The first pictures of the series were taken in the white oak and red gum forests of Arkansas, where some very large logs are obtained. In this picture the trees are shown as they are felled, and subsequently logs are hauled by the mules or on logging trains to the sawmill, through miles of swamp. Occasionally a yoke of oxen are shown drawing the load. The various processes at the mill are also shown, from the placing of the log on the carriage, through the sawing, grading, piling, and shipping of the finished product to the consumer. Special portions of the film show very clearly the difference between plain sawing and quarter-sawing. The following portions of the film show land-clearing operations in Northern Wisconsin, carried on by the use of the most modern machinery and explosives.

Will Put a Stop to Incendiary Forest Fires

A large number of forest fires in the State of Oregon, which have been traced recently to incendiary origins, have resulted in the state sending detachments of troops to the forests, with instructions to shoot any persons found in the act of setting fire to the forests. The order is based upon both federal and state authority. The Department of Commerce, Washington, D.C., received reports to the effect that I. W. W. agitators and others who are accused of working for the interests of Germany had set fire to thousands of acres of timberland in Northern Idaho, Oregon, and Montana. Among the forests which it was attempted to destroy were some in which large quantities of spruce will be obtained for use in the production of aeroplanes for the Allies.

Logging Camp Quarters on Wheels

Logging operators in Eastern Canada are not intimately acquainted with the system of housing camp employees in cars on wheels which is frequently met with on the Pacific Coast, particularly in camps in Oregon and Washington. Excellent logging quarters are furnished in such cases, and the comfort provided for the men is remarkably complete. The Great Northern Lumber Company, of Leavenworth, Wash., are operating a camp in which the men are cared for in this manner. This company's logging equipment consists

of 28 miles of track; one Heisler and two Climax locomotives are employed; 40 connected trucks and 28 flats transport the logs from the woods to the mill. McFarlane sky-line system and Willamette engines are employed. The ground is very broken and rough where the present logging is being conducted. The operations have been laid out and plans made embracing 600,000,000 feet of timber. Every care has been taken to avoid mistakes, and, despite the unsatisfactory labor conditions and difficult ground, a good showing is being made by the crew.

The logging manager determined to build a model camp and housing system for the men. The camp is portable, the entire outfit being on wheels. The cars are the latest models in camp cars. They are roomy and sanitary, equipped with air brakes and all the necessary safety appliances, and may be transported over any line safely. The cars are 11 x 60 feet.

Construction of Cars

Discarded trucks equipped with new sixty feet 5 x 10 sill, eight sills to the car, decked with two-inch shiplap, covered with 1 x 4 T. & G. flooring, laid with wearing areas, removable studs and braces 3 x 4, top plate 3 x 8, formed with a truss, six truss bolts being used in each side. This is substantially standard box car construction, as to this portion of construction. One by four B. N. car siding outside and ceiling with 5/8 x 4 ceiling inside, cased with special machined 3-inch and 4-inch K. D. casing. All side sash hinged, monitor sash slide. Roof sheathed with ceiling, covered with heavy tarred paper, over which grooved car roofing is laid, carried by perlines grooved into car lines, six horizontal bolts running parallel with car lines. All cars equipped with necessary shelving, cabinets, work tables, etc., and painted two coats; body light brown, trimmed with dark brown; interior, green-gray.

Capacity of bunk cars, 28 men; main dining cars, 72 men.

These cars are made up in the following units: Eight bunk, two full diners, and four kitchen-diners. The latter are equipped with kitchen in one end and diner in the other, it being desired to use these cars in the accommodation of small crews of from 20 to 30 or 40 men, such as filer and bucker crews and small crews used in logging small patches of timber isolated from main body. All bunk cars supplied with a sash for each bunk so as to permit the occupant to regulate ventilation to suit himself. Dining-room tables three feet wide and eight feet long, with seating capacity of eight men, individual stools being used for seating; cabinet for storage of bread, cake, cookies, etc., and table equipment built in end of car.

The Delco electric lighting system is employed. It operates 78 hours with one charge and provides 50 lights.

The bunks are provided with excellent springs and mattresses. In order to ensure that the feet of the sleeper would not protrude beyond the length of the bunk, a section of sheet iron separates each compartment, thus ensuring greater privacy and comfort. Shower baths have been installed in the end of a car.

Screened and Cooled Meat Rooms

The kitchen cars have carefully screened meat rooms. The water tanks are located in this portion of the car to ensure coolness of the contents. The water supply for the kitchen cars, both hot and cold, is located directly above the ranges.

The dishes are white, heavy porcelain, and the cutlery is white metal. The tables are set attractively. Fire extinguishers are installed in each car. The cars are heated with stoves.

New Method of Advertising for Mill and Woods Workers

The C and O Lumber Company, Brookings, Oregon, has recently advertised in a novel way in the Southern Oregon newspapers. It makes a plain statement of the working and living conditions at its camps and mill, which is evidently designed to attract the steady class of men.

This experiment will be watched with interest. Here is possibly a solution of the labor problem that has certainly not been solved by the familiar "three-crew system"—one going, one working, one coming. The advertisement in question follows:

"Brookings Maintains High Level of Living and Employment Conditions.

"Brookings, Ore.

"To the Public: On account of the many letters we have been receiving from parties in this and other localities, we have deemed it best to set out in an open letter the conditions of living, employment, and recreation that surround the employees of this company.

"The town of Brookings and the manufacturing plant are located on a plateau about 100 feet above ocean level and running from the shore line back about three-quarters of a mile. Unlike most sawmill towns, the site is rolling bench land, free from stumps and slashings. The climate is mild. Snowfall is a rarity, and during the summer months the weather is that of a beach resort. In the winter the temperature is moderate.

"The view of the ocean, beach, and surroundings is beautiful.

"A good public school is provided for all grades; moving picture theatre, with a seating capacity of 300, with two weekly shows; general store, carrying a large stock at reasonable prices; also a well-equipped hospital is provided for employees and families, and is in charge of a first-class physician and surgeon, with trained nurse in attendance.

"Living Accommodations.

"For single men there is a large hotel provided with showers and other facilities, with table board that is unexcelled in its line.

"In addition, comfortable bunk houses are provided to take care of excess of single men over and above the accommodations provided in the hotel. Rate of board, $6.25 per week; lodging, 50 cents and up, according to accommodations.

"For married men comfortable houses are provided, with rents ranging from $6 per month and up, according to type selected; water, light, and wood extra at nominal rates usually prevailing in municipalities of like character.

"Wages and Working Conditions.

"The minimum rate for common labor is $3 per day of ten hours time in all departments, with usual advance above this rate for responsible positions.

"The company operates a sawmill, logging camp, railroads, wharves, and shipping; runs its own line of steamers to California points.

"Requirements Applicants Must Fulfill.

"No man over 50 years of age will be employed.

"Before entering our employ each and every applicant will be obliged to pass an examination by the company's physician and satisfy him as to physical condition.

"Married men must work for the company at least thirty days before they will be permitted to bring their families, in order that both parties may be satisfied as to conditions and ability.

"No liquor is permitted in the town; parties found intoxicated will be summarily discharged.

"General.

"We desire to build up a community of sober, thrifty, industrious men with families, and such will be given the preference in the matter of employment at all times.

"There is plenty of continuous employment here for a large number of active, sober men in practically all classes of work, and any parties meeting these requirements can feel assured of employment on reporting here.

"The company invites correspondence from parties interested, and further information can be obtained from M. Jordan and other stage operators at Grants Pass, or F. G. Lung, Medford.

"This point is reached by auto stage from Grants Pass via Crescent City, at the present time consuming about nine hours for the trip.

"C and O Lumber Company."

Under the conditions prevailing in the labor market in Canada, it looks as though a plan of this nature might be worth trying out in connection with some of the mills and logging camps.

T. and N. O. Pulpwood Shipments Show Increase

Pulpwood shipments were made over the T. and N. O. Railway during July, 1917, to Merritton, Thorold, Toronto, Georgetown, Ottawa, Ontario; and Niagara Falls, Fielton, Norfolk, Black Rock, Brownville, N.Y.; Johnsonburg, Pa.; Grand Rapids and Appleton, Wis., and Port Huron, Mich., as follows:

	Cords.
July 1 to 7	2,310
July 8 to 14	2,405
July 15 to 21	2,403
July 22 to 31	4,250
	11,368

This is an increase over June shipments of 2,671 cords, or 30.7 per cent.

Wood pulp and paper shipments were as follows:

	Wood pulp. Tons.	Paper. Tons.
July 1 to 7	239	905
July 8 to 14	444	1,324
July 15 to 21	305	1,159
July 22 to 31	240	1,635
	1,229	5,133

Compared with preceding month's shipments, there is a decrease of 3.7 per cent. in wood pulp and a decrease of 13.9 per cent. in paper.

A campaign is being carried on in the neighborhood of Kingston, Ont., to secure 100 forestry men for overseas service.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) $2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

For Sale–Lumber

For Sale—Lumber .

200,000 ft. Cull 1 in. and 2 in. Hemlock.

S. L. PURDY,
17-18 Coehill, Ont.

For Sale

A limited number of cedar Telephone Poles, 25 ft. to 35 ft. long. Also a few cars 8 ft. cedar fence posts, 4½ in. and up at top. For particulars apply Lynch & Ryan Lumber Co., Marmora, Ont. 18-21

For Sale

Can make prompt rail or boat delivery of from 3,000 to 5,000 pieces of Jack Pine Piling, from 40 ft. to 70 ft. long.

The New Ontario Timber & Trading Co.,
17-20 Sault Ste. Marie, Ont.

Lumber For Sale

300,000 ft. B.M. 1 x 4 and up Clear and No. 1 Spruce.

400,000 ft. B.M. 2 x 4 to 2 x 10 Spruce. Piled widths and lengths separate.

GEO. C. GOODFELLOW,
c Montreal, Que.

For Sale–Machinery

For Sale

Band saw-mill machinery in our Saw-mill at Lakefield, Ont. Two complete units. Shafting, pulleys, three boilers, etc. For particulars apply The Dickson Co., Ltd., Peterborough, Ont. 15-18

Machinery For Sale

One 36 in. planer, roll feed, with countershaft.

One Jackson & Cochrane 24 in. planer, roll feed, with countershaft.

One 36 in. two drum sander, Cowan & Co.

R. W. NICHOLSON,
18-21 Strathroy, Ont.

Machinery For Sale

A Light Planer, Matcher and Moulder.
12 in. 4-side Moulder.
Power Feed Rip Saw.
Trim Saw. 12 in. Jointer.
Dry Kiln. Lighting Plant.

A. J. LINDSAY,
94 Pembroke Street,
17-20 Toronto, Ont.

Wanted–Machinery

Sawmill Wanted

Saw-mill wanted to manufacture about two million feet Hemlock and Hardwood. The Bradley Company, Hamilton, Ont. 18-18

WANTED—Heavy used 54 in. or 60 in. Band Resaw, capable of handling large timbers. Give name of maker, condition, age, where located and price. Box 620, Canada Lumberman, Toronto, Ont. 18-18

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

POSITION WANTED AS DEPOT CLERK for Lumber Company. Can come at once. Box 621, Canada Lumberman, Toronto, Ont. 18-18

WANTED POSITION as trimmer man, air lift; five years' experience mill cutting, 150 M. daily. Address Z. T. Harlow, Crossburn, Nova Scotia. 18-21

WANTED POSITION AS BUYER for good lumber firm in States or Canada. Have over 12 years' lumber experience. Box 23, Canada Lumberman, 119 Board of Trade, Montreal, Que. 18-19

A PRACTICAL LUMBERMAN, forty years old, with twenty years' experience, is open for engagement June 1, 1917. Last ten years with very large Canadian firm as superintendent and sales manager. Best of references. Box 496, Canada Lumberman, Toronto, Ont. 2-18

WANTED POSITION as Band Saw Filer or mill superintendent, having 25 years' experience on band saws and mill wright. Will go anywhere for yearly position. Can furnish gilt edge reference. Age 46. Can speak English and French fluently. Box 609, Canada Lumberman, Toronto, Ont. 15-18

EXPERIENCED LUMBERMAN with good selling connection in Montreal and vicinity, is desirous of establishing a connection with a reliable lumber manufacturing firm in Spruce and Pine on a commission basis. Highest reference. Box 623, Canada Lumberman, Toronto, Ont. 18-19

WOULD LIKE TO HEAR from some saw mill owner who needs the service of a competent and reliable mill man who has had twelve years' experience in manufacturing in up-to-date mills; also would be willing to invest some capital with good people. Box 613, Canada Lumberman, Toronto, Ont. 17-20

POSITION WANTED—As Manager or Office Manager with lumber and woodworking business. Twenty years' practical experience in all departments, including lumber factory and office routine. 15 years with one large Ontario company. Have always made good; best credentials. Now engaged. Apply Box 624, Canada Lumberman, Toronto, Ont. 18-19

Business Chances

Sawmill For Sale

Complete Sawmill for sale, cheap and easy terms. Capacity 20,000 feet per day. Field Lumber Company, Limited, Field, Ont. 11-t.f.

Timber For Sale

Standing Mixed Timber estimated at 280 acres, for sale in St. Etienne de Bolton, near Bolton Centre. The Canadian Last Block Company, Limited, 135 Carriere St., Montreal. 18-19

Saw Mill For Sale

Complete Sawmill with timber rights and freehold lands for sale, excellent shipping facilities. Mill situated County of Shefford, with a visible supply of soft wood and hardwood timber in the neighborhood for an extended life. Address P. O. Box 222, Waterloo, Quebec. 16-t.f.

Saw Mill For Sale

For quick sale, Saw Mill complete, capacity 20,000 feet per day. Or will sell parts separately. Also two Pulpwood Loaders complete with Upright Boilers and Engines, capacity 500 cords each daily. All machinery in excellent condition. For further particulars apply The James Horrigan Company, Limited, Port Arthur, Ont. 15-18

Jobbers Wanted

We wish to let several contracts to take out logs on Berth No. 6, being broken front lying between the Magnetawan and French Rivers. This berth is all convenient to Canadian Northern Railway.

John Harrison & Sons Company, Limited,
Saw and Planing Mills,
9-t.f. Owen Sound, Ont.

Mill Plant and Limits For Sale

43 Miles Limits on 31 Mile Lake, Gatineau Valley, containing Basswood, Spruce, Fir, Pine, Cedar, Birch, Maple and Pulpwood.

New Waterous 8 ft. Improved Double Cut Band Mill complete. Steam Alligator, Boats, Sleighs, Wagons, Harness, etc. For further particulars apply to

A. W. STEVENSON,
P. O. Box 2624,
8-t.f. Montreal, Que.

Factory and Land For Sale by Public Auction

In re:

Damien Lalonde Limited

1000 Christophe Colomb Street,
Door and Sash Factory of Montreal,
In Liquidation

To be offered for sale by public auction at No. 69 St. James Street, Montreal, on THURSDAY, 4th OCTOBER, 1917, at Eleven o'clock.

24 lots of land in St. Denis Ward, City of Montreal, containing over 80,000 feet of land with buildings thereon erected, comprising 2 storeys solid brick building, 150 x 90 ft., iron framed, concrete foundations and ground flooring, gravel roofed, upper floor mill construction with saw mill and joiner shop, kiln and machine shop, heating and lighting system, waterworks and one 8-car railway siding to C. P. Ry., and all the machinery therein contained, lumber sheds, stables and keeper's dwelling, etc., etc.

Conditions of Sale: Purchaser to assume the mortgages of $76,000.00, pay 10 per cent. on adjudication, balance of purchase price on completion of deed of sale as per conditions of sale deposited at the Office of the Liquidators, who will give any other information on demand.

VINET & DUFRESNE,
Liquidators,
18-18 99 St. James Street, Montreal.

FOR SALE

Kootenay District, B. C.

STANDING TIMBER

Cedar	24,500,000 ft
Spruce	17,500,000 ft.
White pine	17,000,000 ft.
B. C. fir	1,100,000 ft

Lies on Jordan River. For quick sale will accept $20,000 for this block. Annual rental only $400. Government dues 50c per M. when timber is removed. Above quantities guaranteed.

We have other larger blocks of choice Western timber to offer.

J. E. MURPHY,
26 and 28 Adelaide St. W.,
16-t.f. Toronto, Ont.

Valuable Water Power

and 162 Square Miles of

Valuable Timber Limits

FOR SALE BY PUBLIC AUCTION

The limits are on the river, Mississippi Branch, a tributary of the Madawaska, and Water Power at Eganville, Ont., on the Bonnechere River. These will be offered for sale by Chas. M. Henderson & Co., Auctioneers, at their office, 128 King St. East, Toronto, Ont., on **October 30th, 1917, at 2 o'clock p.m.** The Limits will be offered in three parcels, as follows:

Parcel No. 1—

Comprising parts of the Townships of Mayo, Carlow, and Raglan, license covers in all 88 square miles, a great portion of which is deeded or located lands.

Parcel No. 2—

Comprising two parts of the Township of Cashel in two licenses, covering 18½ square miles, well timbered.

Parcel No. 3—

Comprising parts of the Townships of Ashby and Effingham, in all, 78½ square miles, well timbered. This parcel also includes lots 29 and 30 Con. 10 Mayo, making 100 acres (more or less), on which is located a valuable water power, known as the Big Chute, situated five miles from the terminal of the Bessemer & Barrys Bay Railway.

All this country was cut over some years ago for the pine, of which there is considerable left, along with large quantities of Birch, Maple, Ash, Elm, Hemlock, Cedar, Spruce, Balsam, and Basswood, suitable for sawlogs, also pulp wood, railway ties, and large quantities of hardwoods for chemical purposes and a great growth of young pine.

These limits are close to the Central Ontario Ry. on the West, a branch line of which runs in the Childs Iron Mine in the Township of Mayo, from L'Mable Station. They are also easily accessable from Barrys Bay, on the Grand Trunk Railway.

The Sale will be subject to all conditions and regulations of the Department of Lands, Forests & Mines, affecting same. The licenses permit the cutting of all kinds of timber, except on deeded or located land.

The reason for selling is for the purpose of closing up an Estate.

Terms of sale regarding limits, 25 per cent. of purchase money down, 25 per cent. 1st of July, 1918, balance 1st of July, 1919, bearing interest at 6 per cent. per annum. A liberal discount can be arranged for cash. Transfer of license will be made on final payment, purchaser bearing cost of transfer.

There will also be offered for sale a valuable Water Power, with a cement dam, and the stone walls of a flour mill; the latter was burned in 1911. This is in the centre of a thriving village served by the C. P. R. and G. T. R. Railways, a good manufacturing site.

Terms for the Water Power: 25 per cent. cash on day of sale, balance can be arranged.

Any further information regarding these properties will be furnished by writing the undersigned.

The properties are offered for sale subject to a reserve bid.

GEORGE B. FERGUSON,
Renfrew, Ont.
August 30th, 1917. 18-18

Maple Squares Wanted

Wanted to purchase for export in 1918 one million feet Maple Squares: 1¼ in., 1½ in., 1¾ in., 2¼ in., 2½ in.; lengths, 12 in., 18 in., 24 in., 30 in., 36 in., 42 in., 48 in.

State price air-dried and bundled f.o.b. cars. State shipping point. Box 625, Canada Lumberman, Toronto, Ont. 18-21

For Sale

Timber Limits and Sawmill, estimated fifteen million feet of hardwood and ten million feet soft woods. Sawmill capacity 25 M. feet, shingle mill 125 M. Docks, tug, booms, logging outfit, houses, etc. Price $35,000.

The Manitoulin Lumber Co., Ltd.,
11-22 Walkerville, Ont

Canadian Forestry Companies in France

The following report of the work of the Canadian Forestry Corps has been received by the Canadian Government from general headquarters in France:

There are at present 22 companies of the Canadian Forestry Corps operating in France. The first eight companies arrived between December last and the end of March, and five companies arrived in April, with their full technical equipment and approximately 60 per cent. of their transport. Eight more companies arrived in the third week in May.

The companies are equipped with Canadian made saw milling machinery and tools, and the greatest efficiency and keenness is displayed by all ranks.

All species of lumber are manufactured, including sawn timber, sleepers, trench-timber, pit-props for roads and mining.

The establishment of the companies, including transport is 190 all ranks. The average production varies according to the nature of the woods. In suitable woods between 1,000 and 1,500 tons of sawn lumber, together with sufficient round timber to bring the output up to 2,000 tons per month, may be expected. On round timber alone, however, a company produces about 4,000 to 6,000 tons per month.

Some of the operations of the Corps are being carried out under shell fire, and one unit was recently heavily shelled, fortunately no casualties resulting.

Of these companies six are employed in the army areas, although their work is greatly handicapped by having to operate in small woods, as a rule devastated by shell fire. The daily output is most satisfactory and wood is delivered direct to armies at short notice.

Companies, including the Canadian Construction Company (colored) are employed in the Jura Wood. The Canadian mills in operation in this area have aroused great interest amongst the French military and civil authorities who have not hesitated to express their admiration of the mechanical efficiency evidenced in the design and construction of the mills.

Ten companies are now working on the lines of communication. Some fine forests have recently been acquired for exploitation in this area.

Wood Fuel vs. Coal

The fuel value of two pounds of wood is roughly equivalent to that of 1 pound of coal. This is given as the result of certain calculations made in a Government forest service laboratory, which show also about how many cords of certain kinds of wood are required to obtain an amount of heat equal to that in a ton of coal.

Certain kinds of wood, such as hickory, oak, beech, birch, hard maple, ash, elm, locust, longleaf pine, and cherry, have fairly high heat values and only one cord of seasoned wood of these species is required to equal one ton of good coal. It takes a cord and a half of shortleaf pine, hemlock, red gum, Douglas fir, sycamore, and soft maple to equal a ton of coal, and two cords of cedar, redwood, poplar, catalpa, Norway pine, cypress, basswood, spruce and white pine.

Equal weights of dry, non-resinous woods, however, are said to have practically the same heat value regardless of species, and as a consequence it can be stated as a general proposition that the heavier the wood the more heat to the cord. Weight for weight, however, there is very little difference between various species; the average heat for all that have been calculated is 4,600 calories, or heat units, per kilogram. A kilogram of resin will develop 9,400 heat units, or about twice the average for wood. As a consequence, resinous woods have a greater heat value per pound than non-resinous woods, and this increased value varies, of course, with the resin content.

The available heat value of a cord of wood depends on many different factors. It has a relation not only to the amount of resin it contains but to the amount of moisture present. Furthermore, cords vary as to the amount of solid wood they contain, even when they are of the standard dimension and occupy 128 cubic feet of space. A certain proportion of this space is made up of air spaces between the sticks, and this air space may be considerable in a cord made of twisted, crooked and knotty sticks. Out of the 128 cubic feet, a fair average of solid wood is about 80 cubic feet.

A Mysterious House Moving

Los Angeles, Cal., has a mystery, the central feature of which is a wooden house, a structure which though of fair size was ordinary looking enough in this centre of beautiful home construction. The house is the property of J. E. Storer, a blind invalid who, with his family, removed to Los Angeles from Australia six years ago. Upon arriving in Los Angeles, a fine home was purchased at 1763 Cahuenga Avenue, and the family has lived there for the half-dozen years in apparent perfect enjoyment.

One morning a week or so ago neighbors were astounded to find a corps of workmen start to work tearing the house down. Piece by piece the structure was reduced to lumber, each individual piece of which was carefully and plainly marked, including the shingles which were torn from the roof and gables. While much of the work was done by paid workmen there was constant supervision by Mrs. Storer and the son and daughter of the family. Visitors were warned from the place by a large sign tacked to the palm trees which adorned the front lawn, and the injunction was backed by a fierce looking dog kept in leash in the yard.

The lumber from the house was done up carefully in neat bundles, except the doors, door frames, window sash, etc., which are to be shipped bodily, and the dismantled structure was loaded on to a British steamer at San Pedro, whence it will be carried to Vancouver, B.C., and from there to Edmonton, Alta., where the Storer family expects to make its future home.

In spite of the curiosity of neighbors and the efforts of an inquisitive lot of reporters, no reasonable explanation was secured of the family's strange proceedings. Perhaps the solution may be obtained later on in Edmonton.

First Standard Ship in Commission

A London, Eng., despatch states that the first of the British Government's standardized merchant steamers to replace tonnage lost through submarines, has been commissioned after completing most successful trials. The keel was laid down in February and the hull was launched in June. It is understood that six different types of vessels, varying in size from 8,000 tons downward, are being built. Many hundreds of such ships will be constructed.

Embargo on U.S. Lumber Exports Expected

It is expected that in the near future lumber will be included in the growing list of articles the exportation of which is embargoed from the United States except under special license to be applied for in the case of each shipment. The proclamation, it is believed, will be broad enough to cover timber and perhaps some other forest products.

Review of Current Trade Conditions

Ontario

There has been the usual early September lull in the lumber trade of Ontario during the past fortnight. Toronto wholesalers report a quiet period, though there has not been anything to complain of either in the way of easier prices or reduced demand. The exhibition at Toronto is responsible to a considerable extent for the quietness, as travellers do not count upon booking many orders when so many people from the country and from other cities and towns are visiting Toronto.

This is the time of year when a car shortage usually begins to make itself felt. Inasmuch as there has been more or less of a shortage throughout 1917, and everyone has been well forewarned about it, it is possible that the usual difficulties may not be so marked this year. Undoubtedly, however, with a large grain crop in the West, the car shortage will be considerable, and delay in ordering shipments of necessary stock on the part of retailers is accompanied by much risk.

It is difficult to sum up the condition of the retail trade. It has been moderately active throughout the year, but, even with the good crops which the farmers have obtained, one cannot say as yet whether the farm trade will be active this fall. A year ago it looked as though the poor Western harvest would cause a slump in trade, yet on account of conditions, the effect of which was not fully appreciated, trade experienced a regular boom, which was accentuated by a shortage of stocks, railroad embargoes, etc., so that prices advanced steadily. This year the farmer is doing much better than in 1916, and, arguing from this fact alone, one would expect an active fall trade. However, in these times of uncertainty it is not wise to bank on such a development.

The general trade situation in the United States will probably become the determining factor in this year's trade, rather than the actual success of the Northwest harvest. At present there is much uncertainty across the border on account of the great shifting of trade from normal routes to those created by the war. The example afforded by the course of events in Canada during the first few months of the war should give some confidence to the trade in the United States, but that country is so vastly greater in population than ours that one cannot bank on this, and possibly we will have to witness a disturbance of trade for a few months in the United States before matters reach a steady basis. The United States situation is, therefore, the key to the general trade situation to-day, and as soon as its line of development becomes clearer conditions in Canada will be fairly easy to analyze. Until that time the lumber trade in Ontario may be expected to continue on a quiet basis, with some tendency towards improvement.

Further reports from manufacturing points in Northern Ontario bear out the conclusion already reached, that the manufacturing season this year will be just as difficult as last year—in fact, probably more so, as last year the trade activity in general justified the manufacturers in doing all they could to take out a large cut. This year the same problems prevail in connection with high cost and inefficiency of labor, and expensive food and equipment, while the market outlook is not so definitely encouraging as it was then. However, manufacturers in general are planning to take out as much as the labor situation will permit.

Eastern Canada

Market conditions at Montreal are still quiet. The building trade is not as good as it promised to be, and permit values show a decline, both for the month of August and for the year to date. The discontinuance of shell box orders is likely to have an adverse effect upon the situation. There have been a few additional orders lately, but, generally speaking, the industry is far less active. Manufacturers in Quebec Province are having the same difficulty as elsewhere in connection with the shortage of labor and the high cost of materials. At present the labor situation is aggravated by the uncertainty resulting from the conscription measure, as operators hesitate to employ men who may be conscripted a little later on. There is a little more activity in the export trade, both with the United Kingdom and South Africa. Trans-Atlantic freight rates, however, are higher, the prevailing figure now being $100 per standard, which has to be paid in advance. A few deck loads are being shipped on account of the light bulk of cereal cargoes. Shipbuilders are finding it almost impossible to obtain British Columbia timbers, as the Western mills are filled up with local orders.

Trade at St. John, N.B., shows no change. There have been no shipments of deals during the past fortnight, and there does not appear to be any likelihood of shipments in the immediate future. Stocks at St. John are not expected to be heavy this winter. It is thought that liners will move considerable quantities before spring. Long spruce and dimension sizes are easier, but boards continue firm. Lath are weak, and so are shingles in the high grades, but low-grade shingles are strong, on account of the heavy demand. No contracts for 1918 deals have yet been made, but a number of enquiries have come on the market. Manufacturers say that prices will have to be much higher in order to cover the uncertainties and the increased cost of operation.

The retail demand for spruce in the Eastern States is not heavy, but continues on a fairly steady basis. Factories and box shook manufacturers are using large quantities. Transportation difficulties continue, and there is not much prospect of relief. Spruce prices are firm. Much larger consumption of spruce would take place if shipments could be got through from mill points to a number of the important consuming districts, such, for instance, as Pittsburgh, Pa. The outlook for trade generally is considered good. The hemlock market continues steady, and prices are firm. Signs of revival in the retail trade are noticeable, particularly in farming sections. Government orders for hemlock are now pretty well completed. As a whole, the demand is good. Lath are quiet at Boston and throughout the Eastern States generally. This applies to both 1½ in. and 1⅝ in. Shingles also are quiet.

United States

The unsettled nature of business in general in the United States continues. This is not a matter of surprise to Canadians who see in the United States situation a strikng parallel to that which existed in Canada during the first few months of the war, and expect the United States situation to develop along similar lines. The experience of Canada in this connection should provide good cause for confidence in connection with the United States industrial and trade situation. Present conditions are undoubtedly the result of an enormous shifting of demand from commodities required during peace time to those required now, and the appearance of the government's demand for great quantities of goods of many descriptions, which has already developed, is certain to provide a steadying influence which will enable trade to come through the readjustment period successfully. Already this condition is developing. Moreover, the agricultural situation is good, and is helping greatly during these rather critical days. Retail trade of every description seems to be picking up in the farming sections. Shortage of labor is becoming very apparent in the United States, as it has been in Canada, and extensive employment of women is being resorted to wherever possible.

Yellow pine manufacturers are complaining of scarcity of labor and shortage of cars. At the same time they are experiencing a much heavier demand from factories engaged in turning out war goods, as well as from the government for cantonment purposes and for wooden ships. During the past two months shipments of Southern pine have greatly exceeded production, and it is expected that this condition will continue throughout the balance of the present year at least. Most of the orders for cantonment purposes have been filled, but supplementary orders are coming forward daily. As this line of business decreases it is expected that requirements for wooden vessels will increase.

Inland Empire pine manufacturers have plenty of orders on hand at present to keep them operating for some time to come, but new orders are not quite so plentiful as they have been. Improvement is reported in the labor situation, but many of the mills are handicapped by the scarcity of logs. It is expected that a number of them will shut down exceptionally early this fall on this account. The car supply for Western mills is fairly good. Stocks at mill points in the Inland Empire are small. Improvement in the labor situation is also reported by Douglas fir manufacturers, and a number of the larger mills are operating again. Manufacturers still have many big orders on hand, and have been obliged to refuse business recently for rail shipmests. Fall delivery orders are not very large. This is partly explained by the fact that when it was not possible recently to place orders on the coast, buyers who could obtain Southern pine turned their business in that direction. Unless the demand becomes much more active, some of the operators are likely to close down until the beginning of next year. Production of timbers for wooden vessels is being pushed ahead vigorously. Production and orders as a whole are about equal.

It is reported that the United States Government is in the market for 7,500,000 feet of quarter-sawn white oak for aeroplane propellers. There is a scarcity of black walnut and mahogany for this purpose, and the government is expected to purchase large quantities of oak. The war demand for hardwoods continues very strong, particularly

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

for thick grades of clear stock. The volume of unsold hardwood stocks, both in the North and in the South, shows a decided decrease.

Great Britain

The spot market at London shows no important change, and very few transactions are taking place in the way of forward purchasing. It seems as though there is little prospect of new business to any extent unless it can be arranged on "ex-ship terms," so that the buyer may be certain of what he will have to pay. Transactions taking place are mostly for small quantities necessitated for service requirements. Fresh arrivals almost all go into consumption. Stocks available for winter supplies show scarcely any increase, and a serious situation is feared unless import restrictions are modified. All reports from Liverpool agree to the effect that the government's concessions in connection with imports of spruce deals from Canadian points have come too late to be of any value during the present season. There is little appearance of any appreciable quantity of spruce finding its way to Great Britain from Canada, chartering having been practically absent up to date. More adequate arrangements are necessary without delay if the shortage is to be relieved. The greatest difficulty at present is in connection with war insurance. The heavy rate quoted for sailers being increased to cover the high value of vessels and the greater cost of goods. All this makes it impossible to sell stocks within the price limit prescribed by the government. Some importers are suggesting that the government be urged to remove the restriction upon imports to neutral sailing ships. If other vessels of small tonnage could be used, a small quantity of timber could be moved, and even a few cargoes would be a welcome addition to present stocks.

At Manchester the scarcity of many lines of stock has become acute. Trade at Glasgow continues on a very quiet footing, and must continue so until the government modifies in a substantial manner the drastic import restrictions now existing. The trade is giving this situation a great deal of attention, and a concerted effort is likely to be made to secure more reasonable treatment. All local associations are being asked to co-operate with the Timber Trade Federation in laying the matter thoroughly before the proper authorities. The trade to-day is facing absolute stagnation, unless the government can be prevailed upon to remove or modify the restrictions, particularly those relating to fresh imports. Government requirements of timber must continue on a large scale, and importers at the various large importing centres are looked upon as the logical channels for this business. The tendency of the government, however, has been to take all government business more and more out of the hands of private individuals, without consideration of trade interests. The demand for packing case material continues strong, and merchants' stocks are rapidly being reduced. No fresh supplies of spruce are reaching the market, and there is no prospect of appreciable imports under present conditions.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Market Report—The Shell Box Situation

Ottawa, Sept. 7.—(Special to the Canada Lumberman.)—Despite a more or less unpromising outlook, caused by the cessation of shell box orders, a feeling of optimism prevails in the Ottawa lumber market. Stocks of lumber for domestic and local use are not so large as during the corresponding period a year ago, but are sufficient to meet prospective requirements.

With Ottawa plants new orders for shell boxes are not obtainable from the Imperial Munitions Board. The representative of the Canada Lumberman, on enquiry at the Imperial Munitions Board, was informed that the requirements of the board were at present fully covered, and consequently orders had been cut down.

The shell box and labor situation are at present the chief concern of Ottawa lumber manufacturing and woodworking plants. It is suggested by some that the cessation of shell box manufacture in Canada will be followed by a drop in the price of spruce. American orders for spruce, however, may help to maintain the price.

During the latter part of August and the early part of September a lull occurred in the local market. Enquiries, both American and Canadian, showed a tendency to fall off, though some of the firms report that they are keeping up pretty well. Prices for the various grades have not fluctuated much. Mill stocks at present are not so large as a year ago. The quantity on hand at the end of the year, however, may exceed that of 1916, if the mills secure sufficient labor to run until ice forms.

Bush operations are getting well under way, but the labor situation is causing considerable concern. Bushmen in the Ottawa district are very hard to get, notwithstanding the high wages offered.

The export market to England has shown no change for several weeks, and consequently stocks cut for the English trade are heavy.

Logging operations on the Ottawa River, from Ottawa to Chat's Lake, are proceeding about the same as other years. The majority of the logs coming down now are for pulp. Fairly high water prevails, considering the season, which is facilitating towing and providing plenty of power for the sawmills.

The estate of James Davidson, whose plant has been one of the largest producers of shell boxes in the Ottawa district reports that no more shell box orders are coming, and the work on old contracts will terminate about September 15. This will cause 100 or more employees to be let out. About half of the plant will continue to operate on wooden boxes for the commercial trade. The sash and door business is greatly reduced on account of the small extent of local building operations. The sawmill operations of the Davidson mill at Fort Coulonge, P.Q., have proved quite satisfactory, the season's cut having been 10,000,000 feet in the eighteen weeks' run. The bush operations, which will employ 150 men, are now getting well under way. The firm expect to take out 200,000 logs.

This winter's bush cut of the Hawkesbury Lumber Company will only be between 60 and 75 per cent. of their last year's cut. The camps are smaller and the men are later going in. The company report that the labor situation with them is better than they had expected. The Hawkesbury Company is well supplied with logs in the water, which will be available for next season's sawing.

Labor Shortage Restraining Quebec Industry

Montreal, Sept. 11.—(Special to the Canada Lumberman.)—Practically no change has taken place in market conditions, which, however, are not as satisfactory as they were a couple of months ago. The demand is on the quiet side, both for home and United States accounts.

At one time the local building trade promised well, but it has fallen away, due in some degree to the high cost of material and labor. Last month the permits totalled $290,168, a decline of $311,172, while for the eight months the total is $3,601,707, a decrease of $20,153.

A few additional orders for shell boxes have been given out. This part of the industry is by no means busy, owing to the filling of previous contracts. Some factories have little work on hand, and one or two have closed portions of the plant hitherto making boxes for heavy shells.

Enquiries as to prospects for the next cut show that the outlook is not very promising in certain parts of the province. One manufacturer states that, notwithstanding the smaller number of men employed in making munitions, he sees no sign of improvement in the matter of men available for the lumber trade. Conscription, he says, is also making the situation extremely uncertain. It is no use engaging men, to find a little later that they are to be conscripted. It may be that such men would be exempted, but one does not care to take chances, involving the outlay of capital.

Advices from Three Rivers are to the effect that none of the pulp and paper companies has made arrangements with contractors to cut lumber. There is a great scarcity of labor and contractors are not keen to enter into agreements until they are assured that men will be available. It is certain that the cost will be appreciably higher for wages and provisions.

The export business is more active. Fair quantities are going to the United Kingdom and also some to South Africa. Rates, however, have advanced and are now $100 per standard to England. More pine is on the way. It is also now possible to send deck loads, both to England and South Africa, on account of the lighter bulk of the cereal cargoes shipped. There is a scarcity of dock labor, which is likely to be accentuated when conscription comes into effect.

British Columbia timber for shipbuilding purposes is hard to obtain, owing to the heavy requirements of Western shipbuilders. The mills are well booked up with orders and cannot entertain fresh offers from Eastern wholesalers. Prices, too, are very high.

The sulphite and ground wood pulp markets are a little more active, with prices steady. The embargo on sulphur by the United States Government threatened to curtail production of pulp and paper, but it is understood that a two months' supply has now been assured.

WHERE MILK IS NEEDED

Are You Practising Practical Economy in the Camp?

The whole world is facing a shortage of food—everyone must do all they can to economize and conserve the available food supply.

One practical way of eliminating all of the waste of one important food—milk—is by using KLIM in all cooking where milk is needed. Klim is the solids of separated and pasteurized milk reduced to powder form. KLIM does not freeze, spoil, sour or permit of any waste.

More economical than other forms of milk for cooking and general camp use.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

St. John Markets—No 1918 Contracts Yet

St. John, N.B., Sept. 10; (Special to the Canada Lumberman):—Very much the same conditions apply to the lumber trade at St. John, as two weeks ago. No deals have been shipped by water, or is there any likelihood of any being moved within the next two weeks, although these days no one can tell what may take place from day to day, as the allies may at any moment call for stocks for delivery in England or France. Since the United States entered the war, prices for long spruce and dimension sizes have depreciated very much. Boards are the only line which have not dropped in price, being today in a very firm position, with stocks very low. Short lumber, such as lath, are weak, but $3 is yet obtainable for laths, this being about 50c per M. less than the spring price. Shingles, in the high grades, are not bringing as high a price as early in the season, but low grades are higher, on account of the heavy demand for a cheaper shingle. Stocks at St. John are very low, and no second, or low grade shingles, are to be had.

No prices are obtainable for deals for 1918, but many enquiries are coming on the market for deals at much higher prices than those paid a year ago, and, if present conditions are any gauge, the manufacturer will certainly need the advance. Wages for men for the woods are from $15 to $20 per month higher than last year. Provisions of all kinds are from 25 to 50 per cent. higher. In fact everything touched by the lumberman, except hay, has advanced in price. Men for the woods are scarce and independent. Work is not, and will not be, as efficiently carried on as a year ago.

The operators at St. John are now getting ready to go back in the woods and have already, in some cases, begun the work of cleaning out brooks, erecting camps, etc., preparatory to cutting logs. The cutting of logs this winter will be a pure gamble. No one can tell just what the costs will be, and unless the operator is powerful enough financially to carry himself, he will have to desist, as, at the present no deal buyers are out to purchase ahead for 1918 cut. One thing is certain, however, that more money will have to be paid for deals in 1918 than during this year, or else the manufacturer will operate at a loss.

All the mills at St. John are yet running, but in some cases it will be an early close down with them.

Stocks of any kind will not be heavy at St. John, and will be largely used before spring, as the liners will no doubt carry some during this winter.

Tribute to Sitka Spruce

Sitka spruce is recognized as the most valuable species of wood in the known world for the manufacture of airplanes. The globe has been searched for a substitute, but up to this time no material has been found to take its place, or even approach it.

The lordly Sitka spruce of the Pacific Coast, with trunks often 8 to 15 feet in diameter and 300 feet in height, has its habitat on the shores of the Pacific Ocean, stretching from the California-Oregon line to British Columbia and Alaska, a distance of less than 2,000 miles. The wood is found growing at a distance generally of about thirty miles from the ocean, except in the case of the Columbia River and other large tidal streams, where it is found growing inland at somewhat greater distances, but only in scattered, individual specimens.

Here is a wood that the chiefs of aeronautic science of the world commandeer to make possible the building of their formidable air fleets. To spruce has been accorded the highest privilege for service ever conferred on any wood in the history of the world. It is the autocrat of timbers. Military genius bows before it. Its clean, milky color, fine texture, and wonderful strength, combined with extreme lightness, have given it a place in a world's struggle never enjoyed by any other wood since nations went to war. It bears its responsibilities with grace and ease. Its laurels are easily worn. It is an uncrowned king. Its use value can hardly be measured. Through the creation of great air squadrons the lasting peace of the world is hastened and democracy is made safe. It is a wood which Major R. Perfetti, the head of the Italan special military commission for aeronautics in the United States, says is consecrated by the Creator to ensure the liberty of the world and is the harbinger of peace and good-will among mankind. What a tribute to the value of a piece of wood in fighting the battle of democracy!

Free Maps of Western Homestead Locations

A publication which should prove of considerable interest to prospective settlers in Western Canada has just been issued by the Natural Resources Intelligence Branch of the Department of the Interior. It is known as the "Homestead" Map, and shows graphically the exact location of each quarter-section which is still available for entry under the free government offer of 160 acres. The map has been published in four separate sheets, one each for Manitoba, Saskatchewan, Northern and Southern Alberta respectively, and is available for free distribution in individual sheets or in complete sets.

No Sawmill however small, is complete without a TOWER EDGER

It increases the output of a mill one-third.

It relieves the main saw of a great deal of work, leaving it free to perform its proper function of cutting up logs; and, when the log is disposed of, the edging is also done.

It makes more merchantable lumber per log.

It wastes the minimum quantity of material, saving considerable No. 1 lumber that is lost when the edging is done with the main saw.

It raises the grade of the lumber, removing hearts, shakes, and knots, making firsts and seconds out of commons, and so cutting up every board as to make it as valuable as possible. For example, a board that will grade as No. 2 may be ripped so that one piece goes into the No. 1's and the other into the No. 2's.

It gives the boards straight and parallel edges.

It makes them of standard or any desired special widths, and automatically cuts them scant, exact, or plump, as desired.

It is also used extensively for ripping.

Install a KRAFT SODA MILL

CANADA has another big war opportunity: Great Britain needs more wood pulp. Install a small Soda Pulp Plant and Supply this need by converting your Slats, Tops, Bottoms and waste wood around the Saw Mill into pulp. We can dispose of any amount. Previous sources of supply in Sweden, etc., have recently been withdrawn and Canada now has a free field in Great Britain to market unlimited quantities of wood pulp. We can arrange contracts for long periods.
The cost of installing plant is small and you make a sure profit from waste material.

Proper Billing of Millwork

A retail lumber dealer, writing to the "Retail Lumberman," takes up the question of the proper bundling of millwork at the factory. This has always been a live problem with the retail dealers, he says. What is needed is systematic and uniform bundling by all the mills. Not only should the mills give consideration to the number of pieces of the different material constituting a bundle, but more attention should also be paid to how and in what manner the bundles are tied. The present custom of the yellow pine mills in bundling lumber is a rank farce.

For example: The writer recently unloaded a car of yellow pine lumber from one of the largest concerns in the business. This car contained eight thousand feet of flooring. This had been tied five pieces to the bundle. When the stock reached our yard more than one-half of the bundles were broken open. The time and material consumed by the mill in bundling this flooring were worse than wasted. The reason for this was the fact that the bundles had been poorly tied and that twine of inferior quality had been used. The stock reached our yard in an unsatisfactory condition, and the cost of handling and piling was greatly increased by the fact that these bundles were broken and the flooring scattered.

This car was no exception; we have often received shipments of flooring, ceiling, etc., where 90 per cent. of the bundles were broken open. Not only are the number of pieces of material to be put into the bundle important, but the manner in which the bundles are tied and the quality of the twine used in tying same is of vastly more importance. The condition in which all lumber is received at the retail yard has to do with the satisfactory selling of the same, and it is an imposition to ask our customers to take lumber that has been damaged by rough handling, becoming dirty and marred by reason of broken bundles, as is so often the case.

The fact that the retailer has recourse on the railroad for any damage to material in transit is not sufficient reason for the manufacturer to continue the habit of tying bundles carelessly or with poor, flimsy twine, as is so often the case.

The careless handling of local shipments for the retail yards by the transportation companies is another custom that is becoming almost unbearable by the dealers. It is no uncommon thing to receive local shipments of mouldings sash, columns, and even ready roofing in such damaged condition as to render it unfit for use. The fact that we have relief in the matter of a claim against the railroad for damage offers very little consolation to the customer who has probably already been waiting for weeks on this material and is badly needing the same.

It is a very uncommon thing to receive a local shipment of mill work in perfect condition. Of course, in some instances the factory is to blame for not securely bundling or crating their shipments, but there is very little fault to find along this line. The trouble lies with the employees of the railroads, who have no regard whatever for the manner in which they handle the material entrusted to their care. We have often wondered how the roads can continue to pay the large number of claims continually being filled by their customers for damage to goods in transit. In every retail yard in the country there is a lot of this damaged material piled up in the warehouse—mute evidence of the rough handling it has received at the hands of the freight handlers.

These are trying times and conditions for the managers of the retail lumber yards. In the face of the existing high prices of material and with every indication that it will go still higher, the problem of getting the business, satisfying our customers, and at the same time making our sales show a reasonable amount of profit is one that is decidedly interesting, to say the least. The average rural buyer of lumber and building material is not informed as regards the market conditions. They do not buy much material during the winter months, and just now many of them are coming in to the market for the first time this year, and they naturally base their judgment regarding prices on the basis on which they secured the same commodity last fall.

These rural customers have a peculiar and unreasonable way of reasoning on this price proposition. They know full well that the value of all commodities, and especially all the products of the farm, has leaped upward at an astonishing rate. The same products of the farm to-day will buy twice as much building material as the same products would have purchased a year ago. Not that building material has not advanced in price, for it has—in many cases quite radically—but the products of the farm have advanced in price so much faster that the ratio has not been maintained.

An example of the changed condition: A few months ago a farmer would bring to market two wagon loads of corn, oats, or wheat and take home one wagon load of lumber, or other building material, with the receipts. To-day the farmer can bring to town one wagon load of the same commodities and take home two wagon loads of lumber or other building material in exchange. This is also true as it relates to live stock, poultry, etc.

We have no quarrel with our farmer customers because the prices of their products are higher and bring them more money than ever before. What we object to is the fact that many of them will not "tote

fair" with the lumberman, and in a spirit of the square deal gladly and willingly pay us a little more for their needs in our lines when the advance on the same has only been a shadow as compared to the radical advance upon their products. It takes time to line the buying public up on the new conditions, but as the dear public is the winner, under present conditions, everythng will come out all right and everybody will be happy.

The retail lumber dealers, as a rule, are always too anxious for business. When a prospective customer comes into the market for a bill of material there is always some dealer who is ready and willing to make a cut in the price of his bill and tie the business up quickly. This is the same old story of acting in haste and repenting at leisure. A case of this nature is at hand. Early last spring there was a customer in our town who decided he would do some cement work, and he was in the market for a car of portland cement. He readily found a dealer who was willing to name him an extremely low price on the car of cement, and the sale was made. Time passed, and this customer's wants in the cement line grew smaller and smaller. Instead of using the car his cement wants consisted of some two hundred sacks; the remainder of his car were left on his hands. In the meantime cement prices advanced, and the customer in question would not return his unused cement to the dealer for credit, but sold it at retail, basing the selling price on the cost of the cement at the time he made the purchase.

As a result of this transaction the cement market in this locality has been upset for the last two months and the local dealers are paying the price of selling too much cement to an unscrupulous customer. Had due time and consideration been taken in making the sale referred to, all the bother and loss of profit attendant upon this transaction would have been avoided; the customer would have paid a fair price for his cement needs and would have purchased only the amount required for his job. Undue anxiety on the part of the dealers to sell prospective customers has cost the dealers thousands of dollars in lost business and a corresponding loss of profit. We as retail dealers should "keep our heads" when there is material to be sold and not bite our nose off to spite our own face, as was the result in the transaction referred to above.

The desire to secure more than his fair portion of the local business has got many a retailer into serious trouble. The golden rule is undoubtedly an excellent standard of business ethics, and if applied to our business will solve practically all of our competitive troubles.

Central Station Uses Refuse Wood for Fuel

In the report of the "Committee on Progress" of the National Electric Light Association is given a short description of a contract of unusual nature and of mutual advantage, being successfully carried out by the Oregon Power Company and the Booth-Kelly Lumber Company, of Springfield, Ore. The latter company operates a large sawmill and planing mill, and, by means of conveyors and blower systems, transmits a portion of the refuse wood to the adjacent plant of the central station company. The power company pays $0.005 per kw.-hr. at the switchboard to the lumber company for all energy generated, and the lumber company in turn pays $0.009 per kw.-hr. for the first 1,000,000 kw.-hr. used in each current year, and $0.008 per kw.-hr. for all over this amount. The contract further calls for a minimum usage on the part of each party to the agreement. For instance, the power company agrees to purchase sufficient fuel to generate a minimum of 3,000,000 kw.-hr. per annum in excess of the amount used by the lumber company, and the latter agrees to use a minimum of 1,500,000 kw.-hr. per annum to operate 76 motors in and about its mills.

The steam required by the dry kilns, heating the offices and operating devices about the sawmill, for which electricity has not as yet taken the place of steam, is secured also from the Oregon Power Company. This steam is used in such quantities as to require an 8-in. pipe with boiler pressure of 150 pounds to supply it, and is purchased at a flat rate of $45 per month. This appears to be a very low rate until it is understood that no account is taken of the fuel to generate this steam. In other words, the lumber company pays $45 per month for the use of the boilers of the power company and furnishes the fuel.

The average energy consumption of the lumber mill is about 8,500 kw.-hr. a day, and approximates daily 40 per cent. of the connected load, which was the load factor figured on when building the plant. In addition to this energy used by the Booth-Kelly Company, the central station generates for commercial purposes from 250,000 to 500,000 kw.-hr. per month. In the accounting at the end of the month the power company pays the lumber company from $700 to $1,200, after satisfying its account for energy used.

Advices recently received from British Columbia state that the strike in the shingle mills of New Westminster and surrounding district has died a natural death, and that all the mills are again running on full time.

Lumbermen's and Railroaders' Clothing

Guaranteed Pure Wool Mackinaw Coats, Pants, Shirts, Mitts Socks, Underwear, Etc., of the Highest Grades.

Plain and Fancy Pure Wool Mackinaw Coats, with high seven-inch collar, close fitting, with tab at throat. Sizes 36 to 46.

EDGINGS

Ontario

John A. McIntyre, Rodney, Ont., will commence preparing plans in a week or ten days for the erection of a planing mill. It is probable that new machinery will be required.

The Midland Shipbuilding Company, Midland, Ont., has been incorporated, with capital stock of $1,000,000. They will build ships and operate dry docks, etc. N. L. Playfair is interested.

William Williamson, 137 Woodbine Avenue, Toronto, Ont., is having plans drawn for the erection of a planing mill, to cost $4,000, at 601 Woodbine Avenue. The building will be one storey, frame construction, shingle roofing, electric lighting, etc.

The Boivin Tie and Lumber Company, Ltd., has been incorporated, with head office at Timmins, Ont., and capital stock of $40,000, to carry on business as timber merchants, sawmill proprietors, timber growers, etc. The provisional directors are F. A. Day and W. A. Gordon.

The Collingwood Steamship Company has been incorporated, with head office at Collingwood, Ont., and capital stock of $40,000, to carry on business as builders of wooden and steel vessels; also to erect wharves, docks, etc. The provisional directors of the company are N. L. Playfair, Midland, Ont.; M. Smith, T. C. Luke, and T. A. Sharp.

The Parry Sound Lumber Company's sawmill, tramway, and part of the dam, together with a small quantity of lumber, were destroyed by fire on September 11. The fire broke out about 2 o'clock. The cause is a mystery, as the night watchman made the rounds every hour. No estimate can yet be given of the loss, but it was fully covered by insurance.

The Schroeder Mills and Timber Company is operating extensively in timber limits along the Pickerel River, in the Townships of Blair and Mowat, Parry Sound District, Ontario. The company is employing 750 men there, and will take out white pine logs. Its cut this winter will be about 25,000,000 feet, which will be disposed of to mills in the Georgian Bay District.

The plant of the Goderich Manufacturing Company, Goderich, Ont., was recently destroyed by fire, the loss amounting to $80,000, with insurance of $76,000. Originally the plant was constructed for the manufacture of furniture, but for some time it has been used for the production of boxes for the William Davies Company, Toronto. The plant was a three-storey brick building, owned by Edward Baechler. The company will rebuild at an early date.

Eastern Canada

Veneers and Panels, Ltd., Montreal, P.Q., have obtained a provincial charter.

Seney & Co., Victoriaville, P.Q., have been registered. E. and A. Seney are interested.

Price Brothers & Co., Ltd., are enlarging their mills at Jonquiere and Kenogami, P.Q.

The assets of F. X. Quevillon, sash and door manufacturer, Montreal, P.Q., have been advertised for sale by tender.

The assets, stock, and good-will of Fraser Limited, Fredericton, N.B., have been sold to Fraser Companies, Ltd., which has been organized for that purpose.

The pulp mill of the New Brunswick Sulphate Fibre Company at Millerton, which was burned and rebuilt, is now operating again. The production is 15 tons daily. About 100 men are employed, and this number will probably be increased.

The Three Rivers Shipyard Company, Three Rivers, P.Q., have commenced work upon laying out their yard, at a cost of $125,000. They intend to build wooden vessels of 5,500 tons dead weight. Messrs. Kirkwood & Son, Three Rivers, are the owners of the business.

The St. John Shipbuilding Company, St. John, N.B., have plans in progress for the erection of a shipbuilding plant. The engineer is Mr. J. L. Smith, Montreal, P.Q., and he is engaged in laying out the company's yard and making plans for the erection of a modern plant.

Damage estimated at $15,000 has been caused by fire to the box factory of Holmes, Hogue & Co., Chatham Street, Montreal. The factory had been closed for a short time following the death of Mr. J. Arpin, a former partner, and, pending the reorganization of the company, under the name of Holmes, Hogue & Co.

The Parker Pulpwood and Timber Company, Ltd., has been incorporated, with head office at Montreal, P.Q., and capital stock of $49,000, to carry on business as manufacturers of and dealers in logs, lumber, timber, pulp, pulpwood, etc., Those principally interested are W. W. Skinner, K.C., G. G. Hyde, and W. G. Pugsley, advocates, all of Montreal.

Work is to start immediately on the shipyard and machine shop of the

Three Rivers Shipyard Company (Kirkwood & Son), Three Rivers, P.Q., which is to cost $15,000. The plant will be two storeys, 75 ft. x 170 ft., concrete foundation, two water slips, 500 ft. long, built on piles. The owners will do their own work.

Duncan C. Scott,, Deputy Superintendent-General of Indian Affairs, reports that no sale of the Fairy Lake timber, in the Counties of Queens and Annapolis, N.S., has been made. This timber was advertised for sale, and sealed tenders were called for up to September 5. It is presumed that tenders received were considered to be too low.

Over 5,000 acres of timber limits were offered for sale recently by the Quebec Government in the St. Maurice and Lake St. John regions, but some 4,300 acres had to be withdrawn, as there was no bid. The average price of the 800 square miles that were sold was $440 a mile—about $100 higher than the previous record. The buyers were adjoining limit-holders.

The British and French Paper Stock Company, Ltd., has been incorporated, with head office at Montreal, P.Q., and capital stock of $10,000, to carry on business as lumbermen, manufacturers of and dealers in logs, lumber, timber, pulp, pulpwood, paper, etc. Among those interested are L. Macfarlane, K.C., J. MacNaughon, advocate, and J. G. Carwright, office manager, all of Montreal.

Western Canada

The Williams shingle mill at Jardine, B.C., was recently destroyed by fire.

John Grenz & Co., lumbermen, Estuary, Sask., recently suffered a loss by fire.

The new export mill of the Canadian Robert Dollar Company, on Burrard Inlet, is now in operation.

A fire in the vicinity of O'Neill's mill, Woodbury Creek, near Nelson, B.C., recently destroyed the company's mill flumes.

The Wabling Lumber Company, Edmonton, Alta., has been incorporated, with capital stock of $20,000. Correspondence should be addressed to A. S. Matheson, 10231 One Hundred and Twenty-ninth Street, Edmonton, Alta.

A boiler explosion at the plant of the Vedder River Shingle Company, Ltd., Vedder River, B.C., recently put it out of commission for a couple of weeks.

John Angevine, of Seattle, and J. H. Sinclair, of Vancouver, have purchased the mill at Tyee Siding, north of Victoria, B.C., which was recently operated by H. A. Stewart, of Vancouver.

Fire in the Campbell River district, British Columbia, recently destroyed five million feet of logs belonging ot the International Lumber Company, four donkey engines, and some railway track. The damage is estimated at $35,000.

J. A. Nowell, of St. Paul, has sold 1,520 acres of timber near Salmo, Kootenay District, to John Waldbeser, of the Emerald Mine, who wants the timber for mining purposes. This land is part of the Nelson and Fort Sheppard Railway grant.

The Kootenay Shingle Company, Salmo, B.C., recently suffered a loss by fire. Forest fires in the Kootenay Boundary swept over a cedar flat near Salmo and destroyed between 2,000 and 3,000 cords of shingle bolts, representing the company's season's cut.

The Hansard Lake Lumber Company, Ltd., has been incorporated, with head office at Prince George, B.C., and capital stock of $25,000, to carry on business as timber merchants, sawmill proprietors, lumbermen, and shingle manufacturers.

A company consisting of Seattle, Portland, and Bellingham interests is arranging to establish a plant on the Fraser River, near New Westminster, B.C., for the production of shingles and sash and doors. Mr. John F. Langan is interesed in the undertaking.

Sealed tenders are being received by the Minister of Lands for British Columbia until Oct. 4, 1917, for the purchase of License X1039, to cut 2,259,000 feet of spruce, balsam, and fir on an area known as Lot 3063, situated near Aleza Lake, Cariboo District. Three years will be allowed for the removal of the timber.

Sealed tenders are being received by the Miniser of Lands for British Columbia until Sept. 29, 1917, for the purchase of License X646, to cut 1,542,000 feet of fir and cedar on the head of Pitt Lake, New Westminster District, adjoining T. T. L. 7558P. Two years will be allowed for the removal of the timber.

A Vancouver despatch states that a petition for the winding up of the Fernie Lumber Company, of Fernie, B.C., has been filed in the Supreme Court there on behalf of the Imperial Bank, who, it is said, are creditors to the company to the sum of $288,139. The company was organized in May, 1904, with a capital of $800,000. Their large mill at Fernie, B.C., has been closed for four years.

Mr. I. T. T. Paxton, receiver and manager of the British Columbia Lumber Corporation, Ltd., reports that he has sold the machinery in the corporation's sawmill at Coal Harbor, Vancouver; also lot 111, Port Moody, a Dominion berth of 640 acres, containing approximately 24,000,000 feet of superior cedar and fir at $60,000. It is understood that the purchasers, the Warren Timber Company, Ltd., will commence logging the tract immediately.

POWER-SPEED-SERVICE WITH DUNLOP "GIBRALTAR" BELTING

YOU CANNOT BEAT "GIBRALTAR"

Now, more than ever, because of the great scarcity of leather, rubber belting is coming to its own.

For this reason—and also because **"Gibraltar"** will give you a hundred times more satisfaction than either Leather or Balata—we urge you to procure a sample of **"Gibraltar Redspecial"** from one of our branches.

They are located in Victoria, Vancouver, Edmonton, Calgary, Saskatoon, Regina, Winnipeg, London, Hamilton, Toronto, Ottawa, Montreal, St. John, Halifax.

When you procure the sample, cut it open, try to pull the plies apart, and note the weight of duck, strength of friction. Then compare **"Gibraltar Redspecial"** with any other make of belting.

"Gibraltar" is constructed of the very best duck. The rubber friction is of the highest quality and has adhesive powers second to none. Separation of plies and stretching are unknown in **"Gibraltar"** Belting. These are some of the reasons why the sales of **"Gibraltar"** have reached their present great proportions.

For Drives, Rotaries, Edgers, Lath and Shingle Machines, or any kind of Transmission work, there is nothing better than Dunlop **"Gibraltar Redspecial"** Belting.

Why not get on the right "Belt Line?"

The Invariable Choice of the Man Who Knows

Yates No. 91 Matcher with Automatic Feeding Table in Brooks-Scanlon mill, Bend, Oregon.

A Great Lumber Company that has operated mills for the past two decades—whose activities have extended

into nearly every great lumber producing region, and whose experience includes the manufacture of lumber from practically every variety of timber—should be a mighty good judge of real merit in planing mill machinery—***And when that company, after purchasing not less than fifteen Yates Matchers during the past ten years, selects a***

Yates No. 91 Planer and Matcher

for its latest operations in the famous new lumber center at Bend, Oregon, there must be something exceptionally meritorious about Yates Matchers.

The name of the Brooks-Scanlon Lumber Co. is as familiar in lumberdom as that of Carnegie in the iron and steel industry. Read what Mr. J. B. Keyes, general manager of Brooks-Scanlon interests at Bend says about the latest Yates No. 91 Planer and Matcher, shown above:

Bend, Oregon, August 22, 1916.

Gentlemen:

In reply to yours of the 18th, we are pleased to state that the No. 91 Matcher is giving excellent results in surfacing stock two or four sides at a feed of 250 feet per minute and in running pattern stock, such as shiplap, drop siding, etc., at 150 lin. feet per minute. The machine has been giving us no trouble in operation and its work, at the speed mentioned, is, we think, beyond criticism.

Yours truly,

BROOKS-SCANLON LUMBER COMPANY.

J. B. Keyes, Gen. Mgr.

To P. B. Yates Machine Co.

Note particularly that Mr. Keyes reports that the "91 gives us no trouble in operation." That means a lot in the operation of high speed matchers, where every minute's delay means hundreds of feet lost in production.

Write for our circular "No. 91." It tells why the "91" is the best buy in the matcher field.

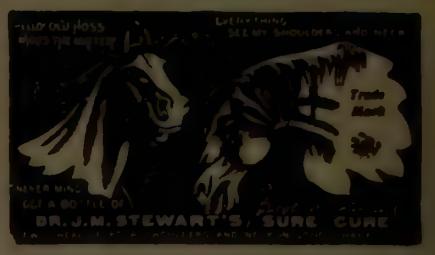
Insure your horses against sickness



Why not? You protect your mills against fire by installing fire-fighting apparatus; you protect your employees against accident by the use of machinery guards—then why not protect the health and efficiency of your horses? And how? By keeping in your stables a good supply of Dr. Stewart's Veterinary Remedies.

It may be the means of saving the life of many good horses, and will keep them sound and vigorous at all times.

A LIST OF DR. STEWART'S VETERINARY REMEDIES

Stewart's Sure Cure (antiseptic gall cure) the original, in liquid form, 16 oz. bottles	$9.00	doz.
Stewart's Excelsior Liniment, 32 oz. bottles	9.00	"

GOODHUE BELTING

FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts," then you will buy a "Goodhue."

According to the conditions under which the belt has to run, we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality, but each made for a different service

YOU NEED "LITTLE DAVID"
FOR WOODEN SHIPBUILDING

— MORE WORK AND LESS WORRY —

The "Little David" Wood Borer is the "Shipbuilders' Wood Boring Machine," because it is light, powerful and speedy, and above all, simple and durable.

It is made in three sizes, the smallest boring holes in wood 1″ diameter and under, and the largest, 4″ diameter and under.

All sizes are reversible, and the cases are of aluminum with steel bushed cylinders. This explains why the largest size is about ten pounds lighter than any other wood borer of equal capacity.

We have other labor-savers for wooden ship work, such as the CC-101 Drift Bolt Driver, Pneumatic Hammers adapted for trenail driving, and Pneumatic Tools for horsing oakum, etc.

Our nearest branch will be glad to give you full information, and to send bulletins, etc., at any time.

The "Grim Reaper" of Your Profits

That irresistible old gentleman, "Father Time," needs the guiding hand of an International Time Recorder, or he will become the "Solitary Reaper" of your profits.

The legitimate profit of most manufacturers' plants is made by buying raw materials and making them into some product. You have weigh scales, gallon measures and yard sticks for checking up most of your purchases, but are you getting all the time you pay for?

An International Time Recording System in your plant will enable each employee to register his own time, and if he is late a "red" entry warns him.

There are over one hundred styles of Internationals — one will meet your requirements. The prices range from ***$135.00*** up.

Getting the original pay roll entry printed
Getting it printed by the employee himself

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

WHOLESALE LUMBER

Eastern Spruce
Hemlock
Pine
Shingles and Lath

Shipment by car, canal boat or cargo.

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

Douglas Fir
Red Cedar Shingles
Hard Pine
Maple Floors

We manufacture Spruce at our own Mills at Portage, Maine, U. S. A., and therefore we know what big prices mean to the manufacturer

Chemicals

A Profitable Industry For Lumbermen

There is a handsome return on any investment in the chemical industry—particularly in the manufacture of those chemicals which we heretofore imported from Germany.

The industry is particularly attractive to lumbermen as many valuable chemicals are obtainable from wood waste by our complete wood distillation and chemical plant.

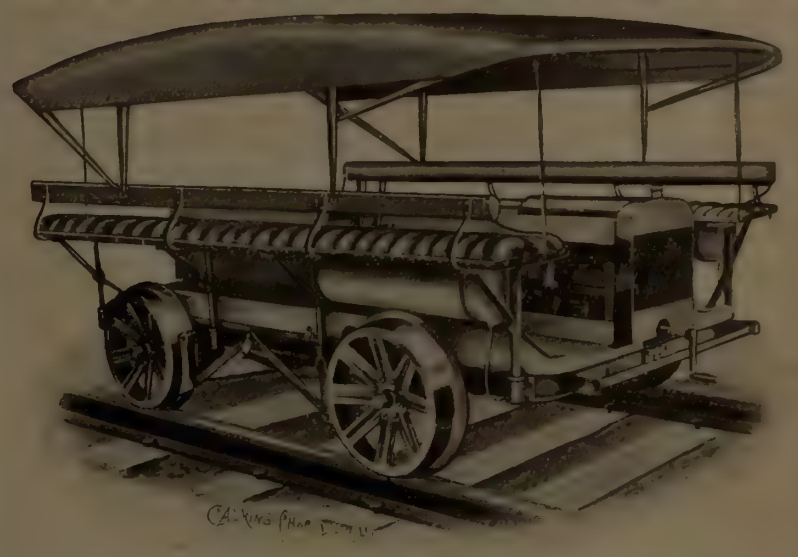
NATIONAL Railway Motor CARS



For Passenger Service

We recommend this car highly for lumber companies operating a short line railway, as it is an ideal car for light passenger service, or tractor for hauling supplies, moving crews, etc. Frame is of 3 x 1⅜ x 5/16 channel steel; axles 1 11/16 inches with Hyatt roller bearings; 20 inch pressed steel wheels of extra strength. Four cylinder, four cycle, water cooled, 10-12 h. p. engine, equipped with Atwater-Kent ignition system, float feed carburetor with throttle and spark control, and kerosene attachment. We also equip the car with friction drive as it gives a variation of speed and power. Reverses by shifting friction wheel over center on the disc, and runs in either direction equally as well. Seats are nicely upholstered, with lazy backs; folding top with jiffy side and end curtains. The car is a complete job that will cut operating expenses in quarter.

Price Complete $800.00 F.O.B. Factory.—If interested write us for complete descriptive matter or place order direct from this ad. 4L

Northwestern Motor Co., 1500 Spring Street **Eau Claire, Wis.**

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at $26,774,937 or 40% of Canada's total output.

Pine production,	905,442,000 ft. B.M.
Pulpwood,	246,282 cords.
Railway Ties,	5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.
For maps and full information regarding Ontario, apply to

EST. 1880 "FACTS FIRST"

James D. Lacey & Co.

EXPERIENCE : RESOURCES : PRECISION

Buy Timber Now!

ALL conditions now conspire to make a perfect situation for investments in timber lands.

After 37 years of study of timber matters we offer it as our opinion that stumpage values will never be so low again.

With the growing demand for agricultural land and the absence of any reforestation policy, every tree down means one tree less. Values must on the whole trend upward.

Add to this a tendency to revert to the use of wood among car builders and others. Add to that the enormous demand for lumber plainly certain to arrive after the war. Every advance in lumber prices means an advance in stumpage values. Buy timber now!

We can fit YOUR requirements.

THERE'S No Better Proof of the worth of Spartan Belting than the work it is doing on difficult quarter-turn drives.

The unusual pliability of Spartan Leather enables the belting to operate successfully on short centres—hugging the pulleys tightly, thereby transmitting maximum power most economically on the hardest quarter-turn drives.

To insure highest efficiency Spartan-equip your hard drives.

FIRE BRICK

Differs in Quality and Variety

For instance, a certain quality or kind of brick that gives satisfaction when used in a Refuse Burner, may show up poorly if used in a Dutch Oven.

It all depends on getting the right kind and the right quality for your particular needs.

Just tell us what you want it for, and we'll send a fire-brick that was made for that very purpose.

We Manufacture the Following Well-Known Brands

"Elkco Special" "Elk Steel," "St. Marys," "Keystone" and "Rotex"

Write for a copy of our Catalog.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

THE E. LONG MANUFACTURING CO. SAW MILL MACHINERY ORILLIA, CANADA

This mark on your saw-mill machinery is an indication that your lumber manufacturing equipment is the best and most economical money can buy.

Steam Feeds

The illustration gives a good general idea of our direct acting, or shot gun, steam feed, which we build in the following sizes: 8 in., 10 in., 11 in., 12 in. and 14 in. bore.

The cylinders are made in 6-ft. sections, and are bored to exact diameter. The flanges on cylinders are faced perfectly true, and finished to templets, so that each section is interchangeable. The flanges are also turned on the outside, which is a great convenience for levelling or lining the feed when placing same in mill. For each end of the completed cylinder we furnish short pipes, which are long enough to reach the valves and permit the valve connections and steam feed to nicely clear the floor timbers.

The front cylinder head is our improved pattern.

The piston rod is made from double thickness, seamless steel tubing, of extra large diameter. It is made in two or more sections, according to length of feed.

Our illustrated catalogue contains full details.
A copy will be sent you on request.

E. Long Mfg. Co., Limited

Orillia - Ontario

An Edger for 6" Cants

You can put a 6-in. cant through this edger and know that it will come through edged to a hair. Edger carries 22-in. saws, 6-in. saw collars, leaving 7-in. clear saw blade, more than enough margin for 6-in. stock

Mandrel is 3⅞-in. in diameter, the three bearings that support it are each almost 10-in. long—the rest of the machine is built in proportion. That's why Waterous New Champion Edgers can be crowded to the limit and will turn out full capacity, day after day, without straining.

Notice the feed rolls, two before and two behind the saws. They are machine fluted to give a firm, secure grip on the timber that holds it fast, but will not mar it in any way.

The press rolls are divided, too, making both sides of the machine independent of each other. It's a worth while feature, decidedly.

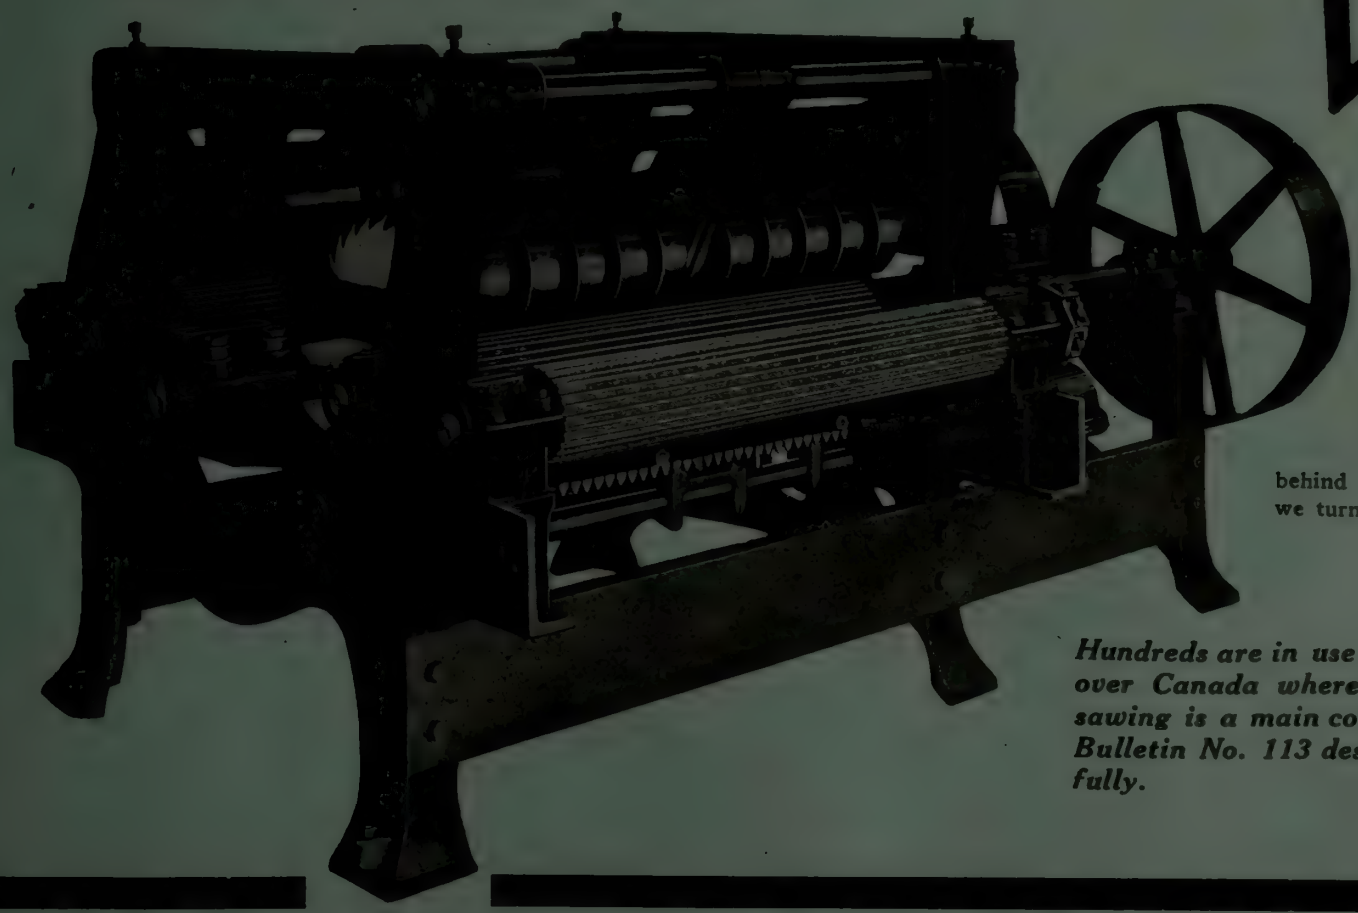
We build up-to-date Machinery for Sawmills of every capacity—circular or band

Catalogues on request

WATEROUS NEW CHAMPION EDGERS

are built with 40", 48", 56", 60" and 72" opening. They carry as many as four movable and two stationary saws without difficulty.

These edgers cut true and to dimension at all times. The guides are rigid and cannot shift in the cut. They are crowded to correct position and held immovably in place by a steel setting gauge that drops upon them. *No other edger has this feature.*



Waterous New Champion Edgers are fast and accurate cutting, easily operated, and perfectly safe. We stand behind every machine we turn out.

Hundreds are in use in mills all over Canada where quality of sawing is a main consideration. Bulletin No. 113 describes them fully.

The Waterous Engine Works Co., Ltd., Brantford, Canada

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb., Fort William and East; West of Fort William 35c per lb.,** delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

MAIN ST.

East Toronto June 17/10

Chapman Double
Ball Bearing C/o

Dear Sirs

In regard to double ball bearings supplied by you, we find those on line shaft giving entire satisfaction and find them quite a saving on power, as for the ball bearing loose pulleys, they are decidedly the finest, and only satisfactory loose pulley we have ever had, no noise no heating and consequently no loss of time, which so frequently occurs with the ordinary loose pulley, we have run the loose pulley on our big matcher for nearly two years and consider it a severe test and it runs as nice to day as the first day we used it can recommend your bearings and pulleys to any one in the manufacturing business especially planing mills with which we have proved

Yours very truly
L. A. DeLaplante Limited
per W. Costain Supt

Chapman Double Ball Bearings

have been installed in over 3000 factories of all classes during the past fifteen years, and the above letter is one of many of a similar import, bearing testimony to the efficiency, long life, and cleanliness of the bearing. Some of these have been compiled in a booklet, "Results", which we will be pleased to send on request.

The Corbet Automatic Double Cylinder Steam Towing Machine

Made in four sizes, accommodating Flexible Steel Hawsers from ¾-in. dia. up to 1½-in. dia.

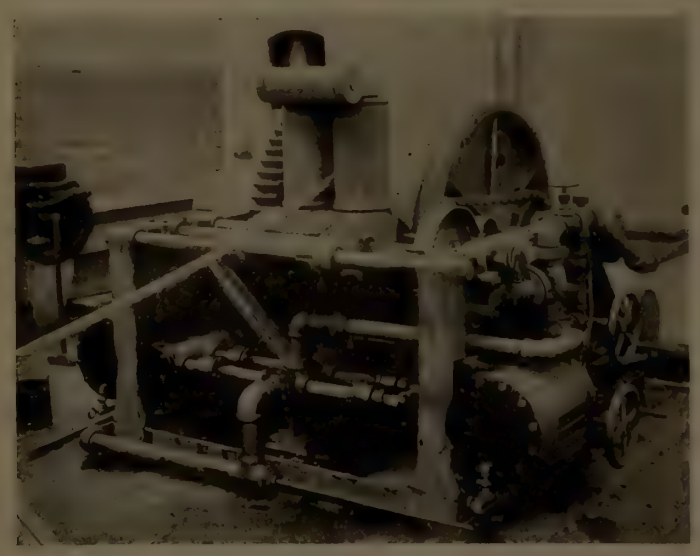
A large number of our machines are installed on Tugs on the Atlantic and Pacific Coasts and on the Great Lakes.

They increase the efficiency and earning power of the Tug.

Does away with having to buy new Manilla Towing Hawsers every spring.

The Steel Hawser will last at least 10 years.

Keeps the crew contented and gives perfect satisfaction.



Read what one of our Customers says.

"TESTIMONIAL"

THE MIDLAND TRANSPORTATION CO.,
Midland, Ontario.

Messrs. The Corbet Foundry and Machine Co., Ltd., Owen Sound, Ontario:

Dear Sirs,—I have pleasure in reporting to you that the No. 3 Automatic Steam Towing Machine, which has 1,350 ft. of 1¼-in. dia. Flexible Steel Hawser on it, which you installed on the tug "Lucknow" this spring, has been satisfactory in every way. The machine has sufficient power to haul the cable in at all times while the tug is working ahead. The Automatic Valve works well when in bad weather, and we find no jerk on the cable. This machine is a big improvement and safer than the Manilla line.

Yours truly,
THE MIDLAND TRANSPORTATION CO.,

The Heat in Your Steam Condensation

What Are You Doing With It?

A big **economy** or a big **waste**?
A big **saving** of a big **loss**?
Which is it in your plant?

Are you returning the condensation in your steam lines immediately back to the boilers as pure hot feed water—or are you allowing it to clog up your apparatus and slow down the operation of your plant?

The thousands of concerns—both large and small—who use the

Morehead
Back to Boiler
SYSTEM

turn the water of condensation right back to the boilers at from 270 to 312 Degrees F.—save from 8% to 10% in coal over the wasteful steam pump—and at the same time keep every inch of heating surface on their equipment working at the highest possible thermal efficiency.

If you are still depending upon steam pumps or other makeshifts for handling the condensation in your plant you can convert a big loss into a big saving by investigating the Morehead System at once. For complete particulars address

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 37 **Toronto, October 1, 1917** **No. 19**

A "Wooden Shipbuilding" Number of the Canada Lumberman

The revival of the wooden shipbuilding industry in Canada is one of the most interesting developments that have come to pass as a result of the war. Many years ago Canadian sailing vessels constructed of wood were known on all the seven seas, but the advent of the steam vessel constructed of steel practically forced the wooden vessels out of existence, and the famous shipbuilding yards of the Atlantic Coast fell into disuse. During the past two years a reversal of this situation has taken place, and wooden sailing vessels, as well as steamers, are being built in many parts of Canada, in order to furnish tonnage to take the place of that which has been destroyed by enemy submarines.

The lumber industry of Canada is doubly interested in the wooden shipbuilding industry, as it furnishes a market for the use of large quantities of timber and lumber, and will be a factor in relieving the scarcity of tonnage for the shipment of lumber and timber from Canada to foreign markets. A large number of wooden steamers for ocean service are being constructed in Canada for the British Government, and private shipyards throughout the Maritime Provinces, Ontario and British Columbia are once more active, working upon orders that are keeping them in operation to their utmost capacity.

A "Wooden Shipbuilding" Number of the Canada Lumberman, which will be published in November, will, for these reasons, be an exceptionally interesting production. It will reflect the activity of the industry in all parts of the country, and be an impressive illustration of its greatness and importance to Great Britain and the Allies in the prosecution of the war. Arrangements are being made to include in this number not only a survey of the shipbuilding activities of the present day, but a review of the early days of the industry, with all its peculiar mingling of romance and trade. Our forefathers understood well the significance of the shipbuilding industry to the welfare of the people of Canada, but in these busy days of steam and the development of the vast natural resources of Canada the events of the past have been largely effaced from our memories, and their records are only found in the annals of the earlier days. The articles which are being prepared for the "Wooden Shipbuilding" number of the Canada Lumberman will recall these activities of former days and set them forth in striking contract with those of to-day.

From this outline it will be realized that the "Wooden Shipbuilding" number of the Canada Lumberman will be one of the most unique and interesting issues of a trade journal that has ever been published in Canada. On account of this it is certain to be prized by its readers and carefully preserved as a record of a distinctive period in our national life, the significance of which cannot be overestimated, and as a review of the life of one of Canada's most interesting and important industries. Moreover, the likelihood that the wooden shipbuilding industry of Canada will outlast the war and be one of the good industries of the country for many years to come, will give to this number an importance that few special numbers can enjoy.

The Wholesaler's Troubles

A reputation for reasonableness and for living up to contracts is a fine asset for a lumberman. It is strange that this fact is not appreciated as fully as it might be by some men who have been in business for a long time. Trying to get out of a contract to buy or to deliver, when the market has gone wrong, is a frequent occurrence. The man who acts in this way does himself more injury than he imagines. He is simply advising the other party to the transaction that he will stick out for the last dollar, and that it is unwise to offer him any concessions or favors, or to give him the benefit of any special market information. In short, a man of this type must pay, in the long run, a higher price for his stock and receive less for it than other men. His way of doing things is to insist upon immediate shipment when prices are going up and to try to crawl out of a contract to buy if prices subsequently fall. If he could only put himself in the other man's position he would see that he is making a bad reputation for himself, which will cost him a great deal.

Price-cutting is another evil that is starting to prevail in the trade to-day. There is much uncertainty in connection with market conditions, logging operations, next year's manufacturing outlook, etc., and it is exceptionally difficult to see far ahead in a business way. Some firms are counting upon a scarcity of stocks and strong demand next year, while others are afraid that the demand will fade away and that stocks which have been taken out or purchased at high cost will be unsaleable except at a loss. While this latter view is not very generally held, it is encountered now and then, and is just sufficiently in evidence to-day to afford a handle for unscrupulous salesmen. During the past week we have heard occasional reports of price-cutting in certain lines. Price-cutting to-day can only be the result of fears produced by mistaken views of market conditions or by some personal desire to depress the market, for an individual and selfish reason.

There are some salesmen now on the road who are endeavoring to create a feeling of unrest, and the harm they do is great. Here is an example: A salesman calling upon Ontario retailers about two weeks ago thought it advisable, for some reason or other, to say that hemlock prices would not hold. Calling upon a certain retailer who needed hemlock, he said: "I have some hemlock to offer at $25 for all lengths, and if you want any I would suggest that you only take a little. Do not stock up, as hemlock will be selling at $18 to $19 before the new year." A few days later another salesman called upon this retailer and, although the latter still needed some hemlock and other stock as well, he said that he was not in the market for anything at the time. After some conversation, the retailer reported what the other salesman had told him, giving it as his reason for staying out of the market. The second salesman found the trail of this man elsewhere during his travels that week. This salesman has put into the minds of several retailers the idea that they will soon be able to get hemlock cheaply, whereas conditions as they are reported by competent wholesalers and manufacturers seem to point towards a steady market on account of the small quantity of stock available, reduced output during the coming winter, and greatly increased cost of production.

These things bring us back to the idea we had in mind at first, namely, that it might be well for the wholesale trade if it had some

definite means of bringing pressure to bear upon parties of this kind, or even appealing to their better or sounder judgment. Price-cutting and contract cancellation are two things chosen at random out of many which play havoc with the trade. Perhaps the most prolific source of trouble is disagreement in regard to grades. When a purchaser receives a shipment of lumber and is disappointed regarding its grade, there is sure to be trouble unless he and the firm he bought from are old friends and know how to handle one another. Otherwise it is a case of one man's word against another's. There ought to be a recognized medium in the form of an association employing inspectors for the purpose of adjusting such differences as amicably as possible. There is ample room in the wholesale lumber trade in Ontario for the creation of such an association. Even the wholesale trade in Toronto alone is of sufficient size to make it advisable to deal with its troubles in this manner. The price-cutter and the man who cancels contracts unfairly might not come in for direct handling under such an association, but the effect of the education they would get would reduce greatly their objectionable ways of conducting business. There are many other matters of importance which can be dealt with successfully in such a manner, among them credits, transportation, legislation, grading, etc., none of which can be successfully dealt with by an individual. The suggestion that an association should be formed has reached the Canada Lumberman frequently of late. Undoubtedly it would be a good plan if the members of the trade would work it out vigorously. It is one of those plans, however, which require enthusiastic support, and is sure to fail without it. We see every reason why the Ontario, or even the Toronto wholesale trade, should adopt it, and we would be glad to assist it as much as possible.

Wood Construction Unfairly Criticized

It is not often that one finds in "Conservation," the bulletin of the Commission of Conservation of Canada, a statement to which objection may be taken, but, in the September number, an article is featured on the front page which, unintentionally it seems, is an injustice to the lumber interests. The article deals with the fire loss in Canadian buildings, and the injustice is contained in the heading, which is as follows: "Seventy Per Cent. of Buildings Are Frame—This Makes Reduction of Fire Waste a Difficult Problem." From this heading one would naturally expect to find the article dealing with frame construction and branding it as the guilty source of most of the heavy fire loss, but the article, fortunately, is not quite so condemnatory of wood construction. Other building materials are included in the guilty list, and the blame is placed upon faulty construction rather than upon materials. It is unfortunate, however, that a slip of this nature should have occurred, as the promoters of substitute building materials are ever on the watch for evidence in their favor, and this one-sided criticism of wood construction will undoubtedly be used by them in their publicity campaign. In fairness to the lumber industry, "Conservation" should now publish an article pointing out the many advantages of wood as a building material when properly used, and showing by fire statistics that proper wood construction is as safe as any other.

"Proper construction," in fact, is what the article in question urges, and it is unfortunate that this was not featured in the heading, instead of "frame construction." "Conservation's" article is as follows:

"Of approximately 2,000,000 buildings in Canada less than one-tenth of 1 per cent. have been built with proper consideration of safety from fire. In the cities and towns from which statistics are available almost 70 per cent. of the construction is frame. The vast majority of brick buildings are structurally defective and inadequately protected, and only one in every 1,200 is even nominally fireproof.

"With such conditions prevailing the enforcement of measures regulating future construction cannot immediately effect any substantial reduction in the volume of fire waste. There are sufficient combustible buildings in Canada to supply the present rate of loss indefinitely.

"Upon the average, fire occurs every year in one out of every eighty buildings in cities and towns. Fire prevention is concerned, therefore, not only with the erection of new buildings, but with what is of equal or even greater importance—correction of the worst faults in existing buildings so that they may be less liable to destruction."

The great thing is to see that, no matter what building materials are used, modern fire prevention methods of construction are used as completely as possible.

The Munitions Industry Situation

The statement recently made in the House of Commons by Sir Thomas White, Minister of Finance, regarding the partial discontinuance of the manufacture of munitions in Canada, definite as it seemed to be, was apparently not fully understood by the general public. The statement was that the Imperial Munitions Board had decided to discontinue the production of certain kinds of munitions in Canada, that other kinds would be produced in lessened quantities, and that the production of some lines was to be continued as at present. This could scarcely be taken, on its face, as an announcement that the munitions industry in Canada was to come to an end, but, considered in conjunction with the importance of the industry to the industrial welfare of the country at the present time, the announcement acquired an additional importance, and was accepted as a matter of the greatest gravity, involving the first stage in the breaking up of the munitions industry in this country. So general was this interpretation that instead of discussing the meaning of this announcement, the public became more interested in the effect of the discontinuance of the industry, upon the employment situation, and many a dire prophesy was heard that much distress was certain to develop during the coming winter.

If we are to form our conclusions, however, from statements which have been made in the House of Commons during a subsequent debate upon this subject the outlook is not by any means so discouraging. Sir George Foster, Minister of Trade and Commerce, and Sir Thomas White, Minister of Finance, in the course of the debate, amplified to some extent the details previously given regarding the announcement by the Imperial Munitions Board. The situation, in the light of what they said, is less ominous than it appeared. Sir Thomas White pointed out that Canada has been paying $25,000,000 per month to the Imperial Treasury for the purpose of paying for munitions in Canada, and it has been arranged to continue these payments during the balance of the present year, and he added: "It is our intention to continue such payments as long as the war lasts." Later in the debate he said: "So far as the munitions industry is concerned, the Dominion Government is furnishing more money now per month than it has furnished since the war began, and it is our expectation that we shall be able to continue the payments until the end of the war." Subsequently Sir George Foster added to the information already given a statement that Great Britain was not purchasing in the United States munitions which could be purchased in Canada. "There are other munitions of war," he said, "which Canada cannot supply, which Great Britain cannot supply to the extent needed, and which he does get from other countries, notably from the United States."

Putting together these announcements and explanations, it seems justifiable, in the absence of any more definite statement, to conclude that, although the production of certain kinds of munitions in Canada has been discontinued, other kinds are being produced in large quantities, and if the logical conclusion is taken from Sir Thomas White's reference to the continuance of the supply of finances from Canada, the total output will be just as great, though the kinds furnished will not be the same. If this conclusion is correct there is little to worry about as yet in connection with the situation. Those who are thrown out of employment in one kind of munition production will probably

be able to find employment in factories engaged in other kinds of munition production, and there will not be any great amount of unemployment in Canada during the coming winter.

While it is reasonable to take this hopeful view of the matter after what has been said in the House of Commons, the uncertainties connected with anything depending upon the war situation make it inadvisable to count upon any prolonged continuance of the munitions industry. The end must come sooner or later, and undoubtedly a gradual diminution in the extent of the industry will be less harmful than a sudden stoppage. It is to be hoped, however, that the change, whether it is brought about suddenly or gradually, will not be inaugurated at the beginning of winter, but rather that it may come when winter is over and the distress accompanying unemployment during cold weather has not to be faced.

Ontario Forest Protection Proving Efficient

Excellent progress has been made by the Ontario Forestry Branch in the reorganization of the forest fire protection work, for which provision was made last winter by the Legislative Assembly, says "Conservation." This work has been vigorously carried forward under the direction of E. J. Zavitz, Provincial Forester; J. H. White, Assistant Provincial Forester, and L. E. Bliss, General Superintendent of Fire Protection.

The province is divided into three districts, with headquarters at Cochrane, North Bay, and Port Arthur respectively. Under the three district chiefs are 34 chief rangers, assisted by 31 sub-chief rangers. These men provide the immediate field supervision over the 986 rangers who do the actual patrolling and fire-fighting.

For the most part, the rangers work in pairs, travelling by canoe, and carrying their camp equipment and supplies with them. The general shortage of men, due to the war, has rendered it difficult in many cases to secure rangers. Much care has, however, been exercised to secure only competent men, and to weed out those who prove to be unfit for arduous duties. The chief rangers and sub-chiefs are in constant personal touch with their men, and the staff is rapidly improving in efficiency and team-work.

Communication and transportation, both of prime importance, have been greatly improved. Some 915 miles of old trails and portages have been cleared out, and 60 miles of new trails and portages constructed. Thirty-one lookout towers, from 24 feet to 80 feet high, have been built, and 22 more are under construction. Thirteen rangers' headquarters' cabins have been built, in addition to the repair of old ones. About 45 miles of telephone line have been erected. Five automobile trucks with fire-fighting equipment have been provided for districts where settlement is under way and passable roads exist.

The permit system of regulating settlers' clearing fires has been put into effect in the Clay Belt and is working very well. Over 1,200 permits have been issued to date. Its enforcement will no doubt greatly reduce the amount of fire loss in Ontario as it has already done in Quebec, British Columbia, Nova Scotia, and New Brunswick.

A change of policy of prime importance has been made effective this year, in that the work of fire prevention and control is no longer restricted to lands under license to cut timber or to forest reserves and parks. On the whole, all these are being given better protection than ever before, but, in addition, protection is being furnished over large areas of unreserved and unlicensed lands, containing enormous amounts of young forest growth, which will now have an opportunity to reach merchantable size while timber of merchantable size elsewhere is being exploited.

Last year the area of land under license to cut timber was 15,712 square miles. A fire tax of 1 cent per acre per year has been levied by the government, and should yield a revenue of upwards of $110,000. To this the province adds a sufficient sum to bring the total forestry appropriation up to about $375,000. The province can well afford this expenditure for the conservation of its forest resources, for last year the forest revenue amounted to $1,335,320. This is a decrease of nearly $200,000 from the previous year, and is directly attributable to the war. Under normal conditions the annual forest revenue will average from $1,500,000 to $2,000,000.

The Future of the Horse

While the horse has been superseded in many lines of work by tractors, trucks, and automobiles, it still has a large field of usefulness in logging operations as well as in many other fields. Sometimes lumbermen are led to wonder, however, whether the day of the horse is limited even in the logging industry. That they will still count largely upon the horse for many years to come is predicted by Dr. J. G. Rutherford, the most experienced veterinary surgeon in Canada, who has many years of government service to his credit. In an address before the Western Canada Irrigation Association recently, Dr. Rutherford said:

"As far as the light-legged horse is concerned he is practically doomed. The motor car has taken his place. Although still of some use in courtship, he will go out of business as soon as the self-guiding car comes on the market.

"For a number of years the heavy horse will be in demand. He is keenly in demand at the present time. Prices were never so high. After the war is over there will be a great demand for them in the countries now ravaged by war.

"I have in my possession an official publication from the Belgian Government giving many harrowing details as to what happened to the Belgian horses. The brood mares and foals running in the fields were slaughtered, being often used as targets by the German soldiers. One pure-bred stallion, valued at $10,000, was burned up in his box, while the groom and his wife and children were forced on their knees to watch the agonizing death of the noble animal. Then the Germans realized that they were making a mistake in destroying these valuable horses and began to ship them to Germany. They sent their experts to select the best individuals, giving to the Belgians for payment orders on the Republic of France, payable at Paris. These orders were in German, and were often for the most trifling sums.

"I have had interviews with representatives of all the large cartage companies in our cities, and they say that, so far as they have gone in trying out the motor trucks, they have found the horse much more satisfactory and economical. Whether the development of the motor truck, which until comparatively recent years did not receive as much attention as that of the passenger car, will be taken up with energy enough to make it sufficiently economical to supersede the horse I cannot say. The heavy farm tractor is a thing of the past. The light farm tractor has come to stay. So far as the horse business is concerned, a man can continue to breed heavy horses without any risk of market failure for at least ten or fifteen years to come."

The severe fires in Southern British Columbia late in July destroyed large quantities of young forest growth which had established itself on lands previously burned over, in addition to considerable areas of merchantable timber, says "Conservation." A portion of the young forest so destroyed was upon the area included in the great Fernie fire of 1908. Investigations made by the Commission of Conservation show that the damage done by repeated forest fires on a specific area is much greater than is generally realized. Such fires not only destroy the young growth, but the seed trees as well, thus preventing or greatly retarding the establishment of a stand of commercial species. On this account, in many sections, reproduction of valuable species is wholly inadequate, or is entirely lacking; each successive fire diminishes the earning capacity of the area, from the point of view of timber production.

Trade and Logging Conditions Reviewed

Manufacturers and Wholesalers Agree Regarding Difficulty in Summing Up Present Situation—Logging Costs Still Advancing

The Canada Lumberman has made enquiries, by correspondence, of a number of lumber manufacturers, wholesalers and retailers, in various parts of Canada regarding the market situation, with special reference to the outlook for logging operations and for prices during the coming winter. The letters published below are some of the replies that have been received. They will be read with interest by lumbermn. These letters show a complete unanimity of opinion in regard to the greatly increased cost of operation. They also show that most logging operators are finding it difficult to obtain sufficient labor, and that wages are higher than they have ever been before. Some operators are inclined to the belief that the labor situation will improve during the fall and early winter and that it will be possible to take out a moderate-sized cut at least. All agree that the cost of operation this winter will be very high. Most manufacturers and wholesalers are unwilling to express an opinion in regard to the probable course of lumber prices on account of the uncertainty connected with all the important markets.

Apparently most of the trade are looking anxiously toward the United States market, counting upon it either to keep prices firm or to be the cause of a fall in prices, according to whether the demand from across the line continues strong or falls off. This is a matter which cannot be foreseen at present, and, therefore, wholesalers and manufacturers, in most cases, are taking a cautious stand. In some cases our correspondents have preferred not to go on record with their opinions, and we have accordingly made use of the important portions of their letters without publishing their names.

* * *

A Light Cut Expected in Nova Scotia

Editor Canada Lumberman: Bear River, N.S.

It is a bit early at the present time to report upon the outlook for logging operations during the coming year, yet some matters have developed, and we can perhaps give a fairly correct forecast of what is likely to occur.

As you may know, for the past two years we have been paying particular attention to hardwoods, making clothespins, dowels, etc. Owing to the embargo in the English market, we have decided to discontinue operations in hardwoods until after the war and in the meantime to turn our attention again to softwoods.

So far as we can learn, the quantity of softwoods—spruce, pine, and hemlock—that will be cut in the western part of Nova Scotia during the coming year will not be greater than was cut in 1916, and the cut in 1916 was about 50 per cent. of the annual cut hitherto for the past ten years. Various reasons may be given for this view, one of which is that there are in Western Nova Scotia at the present time some 50 to 75 vessels being built. The amount of wood used in the ordinary vessel is about 150,000 to 250,000 feet, depending upon the size. This, of itself, absorbs a substantial percentage of the quantity which usually goes into lumber. and takes the largest and best spruce timber.

Then the difficulty of securing tonnage and the extreme rates now being demanded make the business so uncertain, as well as unremunerative, that many people do not feel like taking the risk of what the future may hold along this line.

We shall ourselves probably put in a somewhat larger quantity during the coming year than we did in 1915 and 1916, for the reasons given above, always provided we can secure the necessary men to conduct the operations. This is an extremely difficult matter, and what influence the present conscription act may have upon the labor supply, already too scanty, we are not able to forecast.

There is, however, a great amount of uncertainty in any forecast one can make at this writing. Stocks of deals in the English market are lower than for the past fifty years, and, while the forestry battalions, both in England and France, may aid the situation somewhat, the time has about arrived when a further import must be made from this side of the water to relieve the situation on the other side.

The tonnage situation and the labor situation are really the keys to the present position, and what will develop in the next two months may be deemed a matter of prophecy, in regard to which one should be extremely careful.—Clarke Brothers, Limited.

* * *

New Brunswick Manufacturers Reducing 50 Per Cent.

Editor Canada Lumberman:

As you are aware, the New Brunswick Government passed an order-in-council recently, doubling the stumpage rates. This, coupled with the extreme scarcity of labor and the fact that. whereas we were able to hire men last year for $35 to $40 per month, to-day the cheapest class of labor is asking $50, and the very marked increase in the provision prices makes it almost prohibitive to go into the woods.

The lumbermen met the government and placed the facts clearly before them, and hoped that the stumpage would be reduced to $2 per thousand. They. however, did not take our view of the matter sufficiently seriously, and only made a reduction of 50 cents, or placed the stumpage at $2.50. Usually at this time of the year we have our logging arrangements made, but, up to this moment we have not made any arrangements, nor have we had one of our operators call upon us looking for a contract.

I have heard the matter discussed by quite a number of our prominent lumbermen, and all are of the impression that the operations will be decreased 50 per cent. So far as we are concerned, it looks as if we would only get out about 40 per cent. of what we had last year. Some of the larger logging men are not going into the woods at all, as they state that, with the high cost of provisions and the great uncertainty of men—irrespective of the high wages—they would be taking too much chance.

All the mills here have their yards piled to their full capacty. as there was only one steamer taking a cargo of about three million from this port this year. In view of this, I do not see where the millmen could pile their next year's sawing, provided they got the logs out, so that I am looking for a difficult year for the lumber business on the Miramichi. Conditions may change materially between now and the close of navigation. I am not usually a pessimist—in fact, I think I am rather optimistic, but I really do not see much to encourage optimism in the present situation.—New Brunswick Manufacturer.

* * *

Heavy Curtailment Probable on New Brunswick North Shore

Editor Canada Lumberman: Bathurst, N.B.

Up to the present very little logging has been done in this part of the country this year. The conditions are such that there is bound to be quite a large curtailment this year in cutting operations in the woods.

We cannot see any profit in the lumber business for next year, even if prices were increased somewhat above the present level. Men are scarce and independent, supplies very costly, and the transportation situation is most serious; absolutely no tonnage for export, and cars so scarce that we cannot secure 25 per cent. of our requirements. Altogether there are so many unfavorable conditions and such difficulty to do any business that it is not worth the exertion required to carry on. We think that if the lumbermen of the country would take a year's rest. and do absolutely nothing, it would have a most favorable effect. In the interval we could devote ourselves to the shipping of any stock we have in pile, and get ready for the adjustment that is coming along very shortly. The labor situation alone is so serious that little or nothing can be accomplished, and until this difficulty is corrected no satisfactory trade can be done. So long as we attempt to go ahead this trouble will increase, and it seems to us a complete suspension of cutting and sawing is the only cure for our industry.—Bathurst Lumber Company, Limited.

* * *

Miramichi Output to Be Curtailed

Editor Canada Lumberman: South Nelson, N.B.

There is very little we can report from here in regard to the lumber situation. The mills have been sawing all summer and yarding their stock. With the exception of a limited quantity which went forward by rail and a few hundred standards shipped as part cargoes of two steamers, nothing has gone forward from this port. The result is that the yards are full to almost their capacity, with no immediate prospect of relief in the way of transportation. It is true that some of the stocks are sold by the manufacturers, but this does not relieve the situation as far as yarding is concerned. There is very little, if any, movement for the coming winter's operations. The operators are faced with full yards of manufactured goods, excessive prices for all kinds of lumbering supplies, shortage of labor, and high wages for what there is, an advanced rate of stumpage on crown land leases, and uncertainty of conditions in the spring. In view of all this, it seems at present that the cut the coming winter will be very much curtailed.

We cannot give you any further information regarding the situation at present.—George Burchill & Sons.

* * *

New England Spruce Prices Higher

Editor Canada Lumberman: Boston, Mass.

Eastern spruce has taken quite a jump of late, but whether the prices will be sustained is quite a question. We do not think an increased demand for Eastern spruce has caused this advance, but rather a general feeling among the trade that the lumber is worth more than they have been asking. Spruce frames on a $40 base for 8 in. and under are in good demand and will sell at that price, and probably advanced prices can be got for the wider stock, but random is of rather doubtful sale. We think things are quieting down here, more or less. We do not look for a very active fall in the general trade about the New England States, and we think the same conditions obtain in the Ottawa district. However, there is a great deal of war business yet, even in

lumber, and that seems to keep things moving, although it certainly seems to us we are not likely to see quite as active business during the next six months as we have had in the last six.—Shepard & Morse Lumber Company.

* * *

Eastern Box Makers Busy

Editor Canada Lumberman: St. John, N.B.

As the box business is very brisk and we find the volume of our business steadily growing, we are figuring on getting out for the coming winter fully as many logs as we got out last season. The cost is likely to be even higher than last winter, but we are obliged to carry large stocks of dry lumber if we hope to continue to maintain successfully and develop the box business. Narrow spruce side boards, 4, 5, and 6 inches, are at present selling here with comparatively light stocks in sight at $24, with wider stock in proportion. In fact, the box men will be obliged to advance their prices sharply unless there is an easing off in prices, which is very unlikely to happen at this season of the year.—Wilson Box Company, Limited.

* * *

Fifty Per Cent. Curtailment in Nova Scotia

Editor Canada Lumberman: New Glasgow, N.S.

It is almost too early yet to know just what logging work will be undertaken this winter. It is safe to say, however, that the operations will be on a very limited scale. The scarcity of labor, the increased cost of supplies, and the high rate of wages will all tend to a curtailment. Over and above these conditions is the fact that the British market is practically closed, and it is to this market that most of our Nova Scotia lumber is exported. The only compensating feature is that the local market is exceptionally good. My present judgment would be that there will not likely be more than one-half of the customary cut made in Central and Eastern Nova Scotia next winter.—R. M. MacGregor.

* * *

Outlook Uncertain

Editor Canada Lumberman: Montreal, P.Q.

The lumber situation at present is in a rather precarious state. The demand for common lumber is exceptionally good and prices are firm, but, owing to the lack of shipping facilities to the British market and the Argentine, a great deal of lumber is being held over, which may show a loss when shipping facilities are restored to normal. The cost of manufacturing, so far as I can see is very high. Wages and everything else have advanced greatly, so that if the demand is not any too good in 1918, there may be a reaction in prices.—Montreal Wholesaler.

* * *

Not Anticipating Much Difficulty at Present

Editor Canada Lumberman: Hull, P.Q.

It is early yet to give you an idea of what we may be able to get of logs this coming winter. You know the saying about "man proposes." We are just beginning to send men into the woods. Our purpose is to take out our usual cut—about 25,000,000 feet. So far we have had no trouble to get men. Whether we take 25,000,000 feet or 20,000,000 feet will depend on the men being available when the harvest is complete. We are not anticipating any great difficulty at the present time.—Gilmour & Hughson, Limited.

* * *

May Be 50 Per Cent. Short

Editor Canada Lumberman: Lyster, P.Q.

Owing to the scarcity of men, indications are that we will be over 50 per cent short in our logging operations for the coming season. It is rather early in the season for us to give you any definite figures, but the situation, as it stands at present, does not look too encouraging.—The Lotbiniere Lumber Company.

* * *

Scarcity of Labor Reducing Output

Editor Canada Lumberman: New Richmond, P.Q.

Owing to our inability to secure tonnage to move this season's cut, we only intend to get about two-thirds of our usual cut of logs during the coming winter. Labor is very scarce at present, with wages 25 to 30 per cent. higher than last year.—Montgomery & Sons Company, Limited.

* * *

Difficulty in Getting Labor

Editor Canada Lumberman: Sherbrooke, P.Q.

We regret that we cannot give you any reliable information as yet in regard to the outlook for logging operations during the coming winter, on account of the difficulty in getting labor during the past season.—Eastern Townships Lumber Company, Ltd.

* * *

The Georgian Bay Shook Mills, Ltd., Midland, Ont., report that they will not be taking out any logs during the coming winter.

* * *

Alberta Retailers Report Good Prospects

Editor Canada Lumberman: Leduc, Alta.

Prospects are very favorable for a good fall trade. Crops are good, with the exception of a small strip which suffered badly through hail. Portable mills west of here are planning on quite a heavy cut of lumber this coming winter.—J. F. Stiles.

Ontario Reports on the Outlook

Curtailment Likely to Be Heavy

Editor Canada Lumberman: Marmora, Ont.

So far as we can see at present, the costs of logging operations during the coming fall and winter are likely to be higher than ever. Wages are still advancing, and experienced loggers seem to be very scarce. The fact is, that the higher wages go the poorer seems to be the quality of the labor obtainable. Almost all classes of supplies are still soaring. Prospects, however, are that hay, oats, and potatoes will be considerably lower. While this may help to reduce logging costs, the relief will be small, in view of the increased cost of almost all other classes of supplies.

In view of these conditions, we do not see any prospect of a reduction in the selling prices of lumber for some months to come. While we hope to get out about the same quantity as last year, this will depend entirely upon the supply of labor. The total lumber production in this district is likely to be still further curtailed on this account. There is no dry stock that we know of in this district. We have had to ship very largely direct from the mill practically all season. The new Military Service Act may still further reduce the labor supply, but so far as this immediate section is concerned it is not likely to be felt as much as in some other places, owing to the fact that nearly all our young men have already enlisted, and we have practically no unmarried men on our pay-roll. We understand that the American Government has made, or is making, arrangements to take every available foot of hardwood lumber on the other side of the line, and this will have a tendency to stiffen the prices of these woods in this country.—The Pearce Company, Limited.

* * *

Expecting Lower Prices for Some Hardwoods

Editor Canada Lumberman: Toronto, Ont.

It is the writer's opinion that hardwood purchases at mills should be and will be at a considerable amount less than the present market prices. The demand for ammunition box ends put a premium on low end 1 in. hardwood to the extent of from $6 to $8 over what it could be sold at for ordinary commercial purposes. This would have to be taken into consideration in purchasing new stock.

It is the writer's opinion, however, that 1¼ in. and thicker lumber will remain, in the common and better grades, at close to the present market prices. Another factor will be that the banks may not be in a position to finance automobile and piano manufacturing firms to the extent which they would like, and still another factor will be the embargo by the United States Government on steel plates. If the automobile and other firms cannot get their steel plates they cannot manufacture, consequently they will not require the lumber needed in the construction. This will lessen the demand, and, of course, the price will have a tendency to sag.

In summing up, the writer would say that he would not contract with any mills at the present market price for their output, but would consider doing so at a price that would take into consideration the factors which may govern trade.—Hart & McDonagh.

* * *

Prediction Would Be Only a Wild Guess

Editor Canada Lumberman: Toronto, Ont.

I cannot offer any opinion at present in regard to the lumber trade situation, as anything I might say would be simply a wild guess. We are all in the same boat, groping in the dark and taking chances. One can predict higher prices and give good, substantial reasons to show why they should be, whereas another can predict lower prices and give equally substantial reasons why they may be expected. Just at present, however, I am not looking for any increase in price, but would not care to hazard an opinion for publication. The only thing I would say is that, unless the American market calls for a larger amount of stock, I think we will see a slight recession in the price of lumber and in a number of other commodities, as well as in wages.—Toronto Wholesaler.

* * *

Will Take Out a Full Cut

Editor Canada Lumberman: Keewatin, Ont.

We hope to be able to put in a full supply of logs this season. Just at the present time men are hard to get. We expect they will be easier after the harvest.—Keewatin Lumber Company, Ltd.

* * *

Conditions All Pointing to Firm Prices

Editor Canada Lumberman: Sarnia, Ont.

We are satisfied that the stock of white pine in the hands of the manufacturers and wholesalers is considerably less than normal. We are also satisfied that the stock held by the retail yards is, generally speaking, very small. They have all been buying from hand to mouth, due to the advanced prices. When we visited operating headquarters of a number of large lumber companies a few weeks ago they were all very short of men and putting in a small number of camps. They cannot afford to take any chance on the market, as their operat-

ing costs are extremely high. With even the normal demand for white pine and hemlock lumber prices are bound to remain firm. If the United States is busy manufacturing war material next spring, lumber prices will advance materially. —R. Laidlaw Lumber Company.

* * *

Putting in One Extra Camp

Editor Canada Lumberman: Ottawa, Ont.

We are putting in an extra camp in the woods this season, but so far we have found it very difficult to get help. We do not, however, contemplate that this condition will continue a great while, as the help for the East, down Gaspe way, has not started to arrive as yet. We understand that some of our neighbors are increasing their woods operations this season very much.—Shepard & Morse Lumber Company.

* * *

Logging Conditions More Difficult Than Ever

Editor Canada Lumberman: Penetanguishene, Ont.

We expect to put in about as many camps as last year, although last year's operations were hampered on account of labor shortage, and up to date this year it looks as though it may be worse. With all materials—feed, wages, etc. —so very much higher, we do not know just where we will get off at, but we are hoping that sellling prices will continue to hold up.—The C. Beck Manufacturing Company, Ltd.

* * *

Colonial Taking Out Their Usual Cut

Editor Canada Lumberman: Pembroke, Ont.

We expect to put in the usual number of camps this season and take out from fifteen to twenty million feet, provided we can get the men. Just at present we are having great difficulty in filling up the number of camps already started, but prospects a little later on may be brighter.—The Colonial Lumber Company, Limited.

* * *

Expect a Steady Market

Editor Canada Lumberman: Ottawa, Ont.

As we find matters, the demand is not as good for building purposes, but there are other requisitions coming in which, we think, are going to more than offset the slackening demand for building, and we anticipate that prices will remain at least at their present level.—Fraser, Bryson Lumber Company, Ltd.

Winnipeg Wholesalers Organize

Wholesale lumber dealers of this city have formed an organization to be known as the Winnipeg Wholesale Lumbermen's Association. The organization consists of the larger number of the lumber wholesalers, commission men, and mill representatives in this market.

Winnipeg is the buying centre for a considerable part of the lumber business conducted by the yards of the Western provinces. A number of line yards, with branches numbering from 25 to 100, have their headquarters at Winnipeg, and practically every mill of importance in the West has a sales representative in this market. The officers of the newly-formed association are representative men in the business, and this makes it certain that the association will be conducted along lines which will prove beneficial to all branches of the trade.

The officers and directors are as follows:

President—W. B. Tomlinson, of Tomlinson & Mitchell.

Vice-President—H. E. Deneen, of Shevlin-Clarke Company, Ltd.

Secretary-Treasurer—W. P. Dutton, of the Great West Lumber Company, Ltd.

Directors—H. E. Deneen and D. J. McDonald, of McDonald Lumber Company; H. S. Galbraith, of H. S. Galbraith Company, Ltd.; H. C. Hodgson, of the Vancouver Lumber Company, Ltd.; W. E. Allen, of the Finger Lumber Company, Ltd., and J. M. McNicol, of Stout & McNeil.

Lumbermen in an Automobile Accident

While travelling in an automoblle between North Bay and Callander on Sept. 12, Mr. H. G. McDermid, of the Union Lumber Company, Toronto; Mr. S. Mulholland, of the Callander Saw Mills Company, and Mr. George Ingram, of the Standard Planing Mills, North Bay, met with a serious accident. A blowout in a front tire caused the car to turn completely over. Mr. Mulholland and Mr. McDermid were caught underneath the car. Mr. McDermid sustained a broken rib and a number of bruises about the neck and head. Mr. Mulholland received the worst injuries, suffering a broken leg. Mr. Ingram escaped with a bad shaking up. Mr. McDermid and Mr. Mulholland were removed to the hospital at North Bay. Mr. McDonald subsequently returned to his home in Toronto, and Mr. Mulholland is making satisfactory progress at North Bay.

In order to save for the Indians of Canada their large timber holdings against loss by forest fires the Indian Department at Ottawa is obliging licensees to pile and burn their "slash" after taking the logs out of the woods. The precaution will save numerous bad.

R. L. McCormack, Toronto, Killed in Automobile Accident

As the result of an automobile accident on Sunday, September 23, Mr. Robert Latham McCormack, of the firm of Gibson, McCormack, Irvin & Co., lumber and coal dealers, Toronto, met with instantaneous death. The news was a great shock to his wide circle of friends in the lumber trade. The accident occurred at about noon, a mile and half from the village of Vivian, where Mr. McCormack and some friends had been visiting the old McCormack homestead. On a stretch of sandy road, flanked by a ten-foot embankment, Mr. McCormack lost control of his machine and the car went over the embankment and turned completely over. Mr. McCormack and his 11-year-old son and Mrs. William Sharpe were pinned beneath the car. Senator William Sharpe, who was also in the party, was thrown free and not seriously injured. The young son of Mr. McCormack managed to extricate himself and to summon assistance in a short time. Mrs. Sharpe sustained several broken ribs and a number of bruises. The boy, Samuel McCormack, escaped without any injuries.

The late Mr. McCormack was a leading business man of Toronto, being identified in a prominent way with the firm of Gibson, McCormack, Irvin & Co., the Conger Coal Company, the Toronto Feed and Produce Company, R. L. McCormack & Son, real estate and insurance brokers, the Crown Life Company, the Merchants' Fire Insurance Company, and the Gould, Leslie Bill Posting Company. As a young man he entered the lumber business with his father and brothers in the village of Vivian, and later moved to Toronto, where he went into the lumber business with his brother-in-law, Mr. Michael Jackson.

Mr. McCormack is survived by two sons who are at the front, the young son who was in the motor car at the time of the accident, and five daughters.

The funeral took place on Wednesday, September 26, from Mr. McCormack's late residence on Annette Street to Prospect Park Cemetery, and was very largely attended, the lumber trade of the city of Toronto being represented in a body.

Wooden Tea Trays Wanted in Great Britain

The Canadian trade commissioner at London, Eng., in a recent report, says:

In the course of an enquiry instituted upon behalf of a Canadian manufacturer it has been ascertained that very large quantities of tea trays, mainly oak, almost exclusively of German manufacture, were imported into this country previous to the war, and as dealers report that the efforts of British manufacturers to replace this source of supply have so far not been satisfactory, there should be a good future opening for the Canadian article, provided that patterns can be furnished which are in established demand here and that the trays can be laid down at competitive prices. The demand is principally for a plain and inexpensive type, and the sale of inlaid and more costly trays is comparatively small.

The first of these conditions, however, necessitates a considerable departure from many of the types of trays which are manufactured for Canadian use, and in the case of some of the trays which are the best sellers in Great Britain, the production of special designs.

It is also certain that Canadian prices are much too dear, present quotations being considerably in excess of current values, and about double the price at which German trays were delivered in this country before the war.

As, however, large quantities of these tea trays are sold in this country and leading dealers would be prepared, if satisfactory arrangements can be made, to contract for large and regular supplies, the possibilities of the trade deserve the attention of Canadian manufacturers. It should be an easy matter to adopt such alterations as are necessary, while production upon a large scale should permit of a considerable reduction in cost, and enable Canadian manufacturers to fall more into line with the views of buyers in this country.

In London alone some of the principal firms dealing in these tea trays express their willingness to go into the matter thoroughly with Canadian manufacturers who are adequately equipped for handling the business.

For the time being the importation of tea trays, like other manufactures of wood, into the United Kingdom is entirely prohibited, but it is a favorable time for investigating prospects for the future.

Wilson Lumber Company's New Manager

Mr. P. Bass, who has been connected with the Dermott Land and Lumber Company, of Dermott, Ark., and Chicago, Ill., for the past five years, has resigned his position as assistant sales manager of that company to become general manager of the Wilson Lumber Company, Ltd., Toronto, Ont.

The Wilson Company, besides operating a wholesale hardwood business at Toronto, owns and operates the Mississippi Hardwood Company, of Jackson, Miss., which has a band mill of about 25,000 feet capacity, cutting mostly poplar, oak, and gum.

Douglas Fir to Be Used for Airplanes

The West Coast Lumbermen's Association, Seattle, Wash., reports that a contract for 25,000,000 feet of Douglas fir for airplane construction has been placed by the Italian Government. The fir is to be substituted in place of spruce, and a great deal of interest has been awakened by this contract, as it was formerly thought that fir was not suitable for aeroplanes. If it is found to be suitable, the problem of supplying aircraft lumber will have been solved.

Specifications from the Italian Government for 25,000,000 feet of Douglas fir, orders for which were placed recently with the West Coast Lumbermen's Association two weeks ago, have been received. The specifications read as follows:

Specification.—Ten per cent. 2 x 4 inches and wider, advancing by 1 inch; no average width guaranteed.

Ten per cent. 3 x 4 and 5 inches; no special amount of each.

Eighty per cent. 3 x 6 inches, 7 and 8 inch or wider; no specified amount of each and no agreed average width.

The 10 per cent. 2 x 4 and wider and the 10 per cent. 3 x 4 and 3 x 5 are put in at mill's option, and they may undership either or both of these sizes as much as they like and increase the 80 per cent. 3 x 6, 3 x 7, and 3 x 8 and wider to offset.

Lengths.—Ninety per cent. each dimension 18 to 40 feet, average 24 feet or more. Ten per cent. 12 to 17 feet not included in the 24-foot average. Odd and even lengths may be shipped at mill's option.

Quality.—Rough green fir at mill's option to ship dry or partly dry at same f.o.b. mill prices, underweights and/or overweights for buyer's account.

Grain.—All to show edge grain on the wide face side—i.e., either vertical or within an angle of 45 degrees from vertical. Not less than six annual rings to one inch; no cross grain or burly grain or curly grain to be admitted.

Sap.—To be bright, and to be allowed in any one piece up to one-fourth the width and one-third the length.

Pitch-Pockets.—Will allow in any one piece one pitch-pocket up to 2 inches long for each 16 lineal feet.

Knots.—Ninety per cent. to be free from knots on all four sides.

Ten per cent. to allow in any one piece one knot up to ½ inch in diameter.

It is mutually understood and agreed that the above description of this special grade describes the low line of limitation as is usual in lumber grades, and that shipments on this order will contain all of the product of this grade and better that is produced when cutting the same. In other words, no portion of the higher grade material shall be selected out and retained by the mill.

Manufacturing.—Must be uniformly sawn. All to be free from chain marks, dog marks, and no hooks to be used in the handling or loading of this stock.

Tally and Inspection.—Tally and inspection at loading mill to be by Pacific Lumber Inspection Bureau, in accordance with special clear quality herein specified, certificate to be furnished and to be final. Buyer's option also to inspect at leading mill in accordance with same special clear specifications herein mentioned, and any difference between the two inspectors to be settled by the chief supervisor of the Pacific Lumber Inspection Bureau, or his assistant.

Australian Imports of Timber

The Weekly Bulletin of the Department of Trade and Commerce publishes a report from the Canadian trade commissioner at Melbourne, Australia, as follows:

Through the incidence of the war, scarcity of tonnage, abnormal marine freight, and the consequent decline in constructional work in Australia, the total importations of timber (lumber) decreased from £2,922,578 in 1913 to £2,153,469 in 1914-15, and, further, to £1,721,819 in 1915-16. The recent marked advance in prices on the Pacific Coast is causing apprehension to Australian importers of Douglas fir. The attention of dealers has been recently diverted to New Zealand woods not hitherto extensively placed on the Australian market.

Present indications are not hopeful for an early improvement for British Columbia exporters. The trend of the importations from North America is shown thus:

	1913.	1914-15.	1915-16.
From Canada	£ 67,981	£ 17,653	£ 4,363
From United States	1,511,615	1,021,175	858,716

Imports from Canada in 1915-16 were valued at £4,363, whereas in the previous year the value was £17,653. Imports from New Zealand were valued at £483,055, against £469,422 in the preceding year. From Japan the value was £88,872, against £67,017. Imports from the United States fell off to £858,716 from £1,021,175.

More than two-thirds of the technical foresters in Canada in 1914 have seen military service at the front. The enlistment of forest rangers has likewise been heavy.

Under-deck Shipments to be Permitted

A cablegram from the United States Consul-General at London states that the British Controller of Timber Supplies announces that applications for licenses to import timber from Canada and the United States will be recommended on the following terms: "In any unrequisitioned space under deck of British or allied steamers and in neutral steamers, if approved by inter-allied chartered executive. Timber must not displace foodstuffs or munitions. Shipment must be within three months of application. Importers must be bound to sell softwood at cost plus 10 per cent., provided price so calculated does not exceed by one-third prices current during last week January, 1917."

From the Canada Lumberman of Thirty-five Years Ago

Hamilton's Timber Shipments

Hamilton, April 1, 1882.—Hamilton is one of the chief ports on this lake at which square timber is received from the back country and shipped to the sea coast. Some timber has already arrived at the booms of the Great Western and Northwestern Railways. The timber already here belongs to Messrs. Flatt & Bradley, of Hamilton, and Murphy, of Quebec. The Wellington, Grey, and Bruce branch of the Great Western and the Georgian Bay branch of the Grand Trunk bring the larger quantities. The Grand Trunk timber comes from about Wiarton. Flatt & Bradley began rafting operations lately. The quantity of timber that will come to Hamilton this year will be less than half the quantity handled last year. The timber will go down to the sea in rafts, very little going by vessel. Staves will be shipped in greater quantities than last year. The business of last season was larger. Thirteen rafts and twenty cargoes of square timber, about 1,600,000 cubic feet, were sent down, besides a raft of spars and masts for Boston. In addition to timber shipments, several cargoes of pipe and West India staves were shipped for the English market. The total value of these shipments exceeded $600,000. The railways delivering the timber received $35,000 for freights, and the cost of making up the timber into rafts for towing to Quebec was between $30,000 and $40,000. The past winter was such an open one that but little timber was cut, and thus the shipments fell off, but on account of the increase in the quantity of staves, business for vessels will be better in that line. Freights are dull, and the only charter reported by Hamilton parties is from Lake Erie to Garden Island, at a figure lower than last season's rates.

Chignecto, N.B., Hemlock Lands.—There can be no doubt but it is a bad policy for New Brunswick to sell hemlock lands to manufacturers of tanbark extract. There is a limit to the quantity of such bark in the province. It ought to be saved. New Brunswick is placed in a position to do the tanning for the Dominion. None of the Western provinces have much hemlock, but the Far West will produce great quantities of hides. The rich pasture lands of British Columbia and of the states further east than there, are destined to feed the herds and flocks which will supply meat to Europe. No doubt the exportation will be largely in the shape of dead meat, fresh and in barrels. The hides should be tanned in Canada, and where so conveniently as in New Brunswick? But it will not take long for men like the Millers, and all credit is due them for their energy, to strip our forests of the hemlock bark and leave the trees, scattered through the woods, a temptation to fire. Whatever may be the motives of Mr. Sayre and his friends in resisting the sale of the lands, there can be no doubt that great care should be taken not to allow our province to be stripped of her wealth for the sake of the trifle that is gained.

Using Short Length Hardwood Lumber

There was a time when all hardwood less than four feet long was thrown away, but to-day many manufacturers are finding a profitable market for this class of stock. For example, pieces 2½ feet in length and 6 inches and up in width are now being saved and shipped to manufacturing plants. White oak and hickory blocks of this character are shipped to factories to make wagon and buggy spokes, while red oak and water oak blocks go to furniture factories to make small articles of furniture.

J. M. Donovan, wholesale lumber dealer, has opened an office at 923 Traders Bank Building, Toronto. Mr. Donovan will handle the product of several important lumber manufacturers, among them being the Brunette Saw Mills Company, Ltd., of New Westminster, B.C., and the Coulson Lumber Company, of Memphis, Tenn.

Cost Accounting for Wooden Box Plants

National Association of Box Manufacturers Adopt System Worked Out by Special Committee and Recommend It for Use*

(Continued from September 15 issue.)

Productive Labor.—The term "productive labor," as here used, is intended to mean all that labor which can be definitely measured against production orders. It is sometimes argued that all factory labor is productive labor, which, in a sense, is true, but inasmuch as the cost of productive labor is to be the basis upon which all other expense shall be distributed to production orders, it is absolutely necessary that there be nothing in this item of cost except what can be definitely measured into the production orders.

In the paragraph entitled "Pay Roll Account" the method of arriving at the total productive labor was described. We shall now determine how much of this total is for sawing, matching, printing, lock-cornering, nailing, and all the other operations of a similar character. The forms shown in Figures 5, 6, and 7 are factory production reports, and are filled out by one workman at each production centre. Fig. 5 is used on the saw line only. Fig. 6 is used at all the other machines. The kind of work is indicated by the number of machine which performed the work. Fig. 7 is used by the handworkers. These reports are sent to the office daily, where the elapsed time is extended and postings made to each job cost sheet. The production reports are then ready for the tabulation from which we learn how much labor has gone into each operation. A few columns of such a form are shown.

Number		Set No. 1.	Set No. 2.	Mch. No. 10.	Mch. No. 15.	Mch. No. 20.
Kind of mch....		Saws.	Saws.	Matcher and squeezer	Printer.	Nailing set.
Rate per hour...		77½	77½	70	50	85
Month.	Day.	Hours.	Hours.	Hours.	Hours.	Hours.

The rate per hour in the foregoing is the combined rate of all the workmen engaged at these production centres. It is not essential that these rates taken in the changes which take place from day to day, but they should be sufficiently high to cover the pay of the best paid workmen. At the end of the month footings are made and extended at the rates shown. The totals are footed and the results compared with the total of productive labor in the pay roll account. If a difference exists, it should be slight, and in that case would not affect the percentage of burden. The purpose of this record is to determine to what extent the productive labor on pay roll has been absorbed in the job costs.

Non-Productive Labor.—Non-productive labor is that labor in a factory which cannot be identified with any production order, but applies to the entire mass passing through the factory. It consists principally of superintendence and maintenance of buildings, machinery, and equipment, and becomes part of the factory burden.

Rental, Liability Insurance, Fire Insurance, Taxes.—Expenses of this nature are invariably paid by the year; therefore, it would be improper to charge the total amount of such payments to the operations of a single month. Provision is made to carry only that proportion of this expense into the monthly factory burden account, which will consume the entire payment at its maturity.

This is an element of cost which does not necessarily occasion the outlay of money. Yet it is very vital that it be considered as an item of expense. Wear and tear is constantly taking place which cannot be overcome, no matter how perfectly the facilities are maintained in good working order. Obsolescence takes place—that state of being when the facilities of to-day are made useless, or uneconomical, by new inventions or other improvements. Beyond these reasons the consumer should pay something for the investment in plant made necessary to provide him with packages economically. If the investment of money in a box manufacturing plant does not pay for itself during its life, which is from ten to fifteen years, besides paying during this period a fair trading profit, then the enterprise cannot be considered to have been profitable.

For these reasons a reserve is created each month. If this is made at the rate of 10 per cent. per annum on the value of machinery and equipment, and 5 per cent. per annum on the value of buildings, a fair charge is established. A greater percentage is permissible for the depreciation of motor trucks, horses, and wagons.

This account is not closed out at the end of the year into profit and loss, but is carried as a reserve. In the financial statement it is used as an offset against the book value of these properties.

Factory Maintenance — Building Expense, Saws and Knives.—These accounts are established for the purpose of segregating, as far as it is thought desirable in each particular case the expense of the business. Other accounts of a similar character may be opened to suit the convenience of existing conditions.

All of these accounts at the end of each month are closed into the factory burden account, except where a monthly inventory of repair parts is maintained. In that case the amount of inventory is carried forward as a balance. Sometimes also extraordinary repairs are undertaken which it would be unfair to charge against one month's operations. In that case it is determined in advance over how long a period these charges should be spread, and only such proportion will be admitted to the monthly operating accounts as one month bears to the whole period.

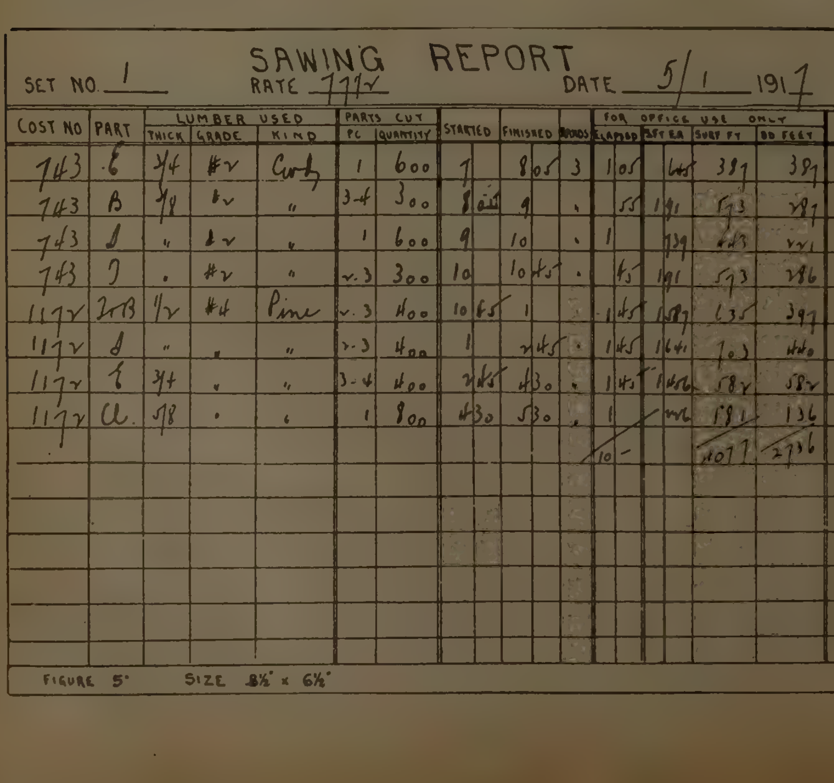
Power.—This account is charged with the wages of engineer, firemen, oilers, the cost of fuel, the purchases of repairs for the powerhouse and its equipment, and fixed charges, such as insurance and depreciation.

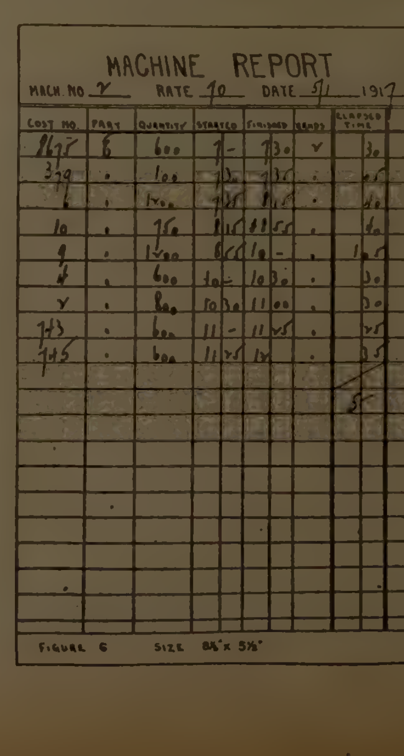
The cost of fuel is not fully covered if only the purchases of coal are considered. The shavings, sawdust, and offal should be charged for if these are used for fuel. The box manufacturer who finds a market for this creates a source of revenue. The manufacturer who consumes it for fuel has also found an economic use for it, and is entitled to a revenue therefrom. This is customary in other lines—as, for example, in the steel business, shavings, and borings are sold, and in the printing trades the trim is sold. In both cases the consumer is charged with the whole cost of material.

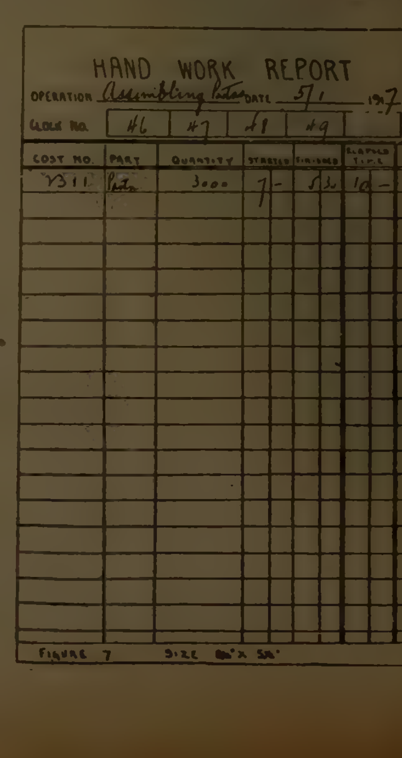
To establish a basis for charging this material to the power account the following plan is recommended:

When a 1 in. board is resawed and surfaced to ⅜ in., 25 per cent. of it is converted into shavings and sawdust. When a 1 in. board is

* Reprinted from Barrel and Box.







surfaced to ⅞ in., 12½ per cent. is converted into shavings. It would hardly be practical to reduce the percentage to an exact mathematical calculation; therefore, each manufacturer must determine the approximate amount of this waste material which is used for fuel—likewise, the price at which it should be charged to his power account.

The basis of price, where practicable, may be set according to the market conditions for this commodity in each particular locality.

In a plant where a part of the production of shavings, sawdust, and offal is sold for other purposes a deduction for the quantity sold should be made from the tonnage produced before the charge against power is determined.

A charge of this nature should be made into the power account in every instance where this material is used for fuel.

In plants where power is produced solely for the box factory the account is transferred into factory burden. Where, however, other producing departments are conducted and supplied with power from the same source, the charge should be pro-rated equitably between these.

Factory Burden.—This is the clearing account for all those accounts in which the factory expenses are detailed. It is provided for the purpose of localizing this class of expense, so that when transferred to the box account the relation between productive labor and factory burden can be seen at a glance.

Administrative Expense.—This is sometimes called the "General Overhead Account," and is composed of all those expenses incurred in the conduct of the business which are not directly chargeable to the factory. For the purpose of further analysis, the items comprising this account may be carried on the books in as many separate accounts as is thought necessary; but, like factory burden, these should be localized in this one account before being transferred to the box account, so that the aggregate of this class of expenses may also be distinguished in its relation to productive labor.

Teaming.—Charges to this account should include all expense incidental to the maintenance of a wagon delivery service. It should also carry a fair proportion of such fixed charges as depreciation and insurance.

A record is kept of the number of hours and kind of service rendered the several departments. By kind of service is meant whether singles or doubles were furnished. Upon the basis of this information the charges are distributed to the various departments in proper proportion.

Delivery service cannot very well be distributed to box production orders on a percentage basis. Length of haul, number of boxes on the load, and conditions in the locality of the factory all play a part in the equitable distribution of this expense. It is therefore left to the best judgment of each manufacturer to solve his own problem.

Note.—These costs are based on f.o.b. factory.

Box Account

In this account all of the factors of production cost are brought together with the value of product. The difference between debit and credit represents operating gain or loss. The quantity of waste in the month's production is found by deducting the number of feet shown in the credit entries from those shown on the debit side of the account. To find the percentage it is necessary only to divide the number of feet wasted by the sum of feet consumed, and in inventory at the beginning of the month. To find the percentage of factory burden and administrative expense, divide each of these elements by the amount of productive labor. Each element of cost is shown in its proper relation to the whole, and a basis is established upon which these elements may be distributed to the job costs. The detail of job costs will be taken up in another paragraph.

The credit in this account for sale of boxes and shooks represents

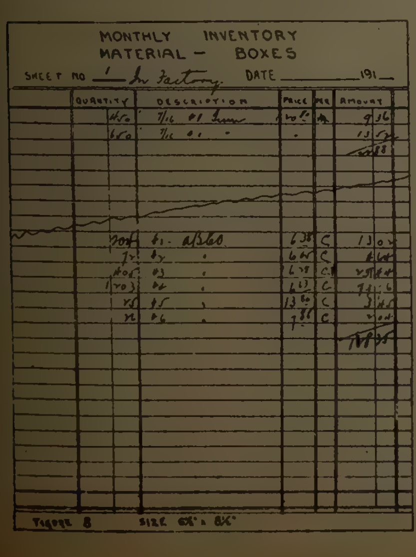


FIGURE 8 SIZE 6⅞" x 8⅞"

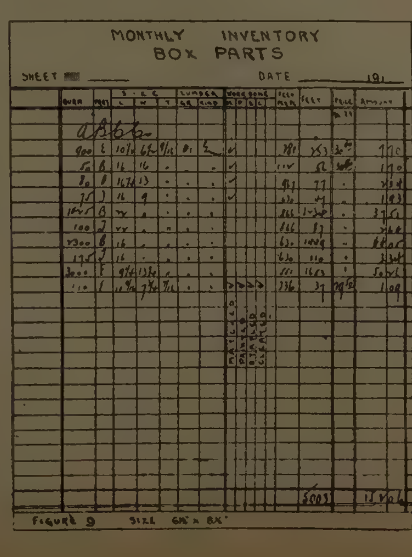

FIGURE 9 SIZE 6⅞" x 8⅞"

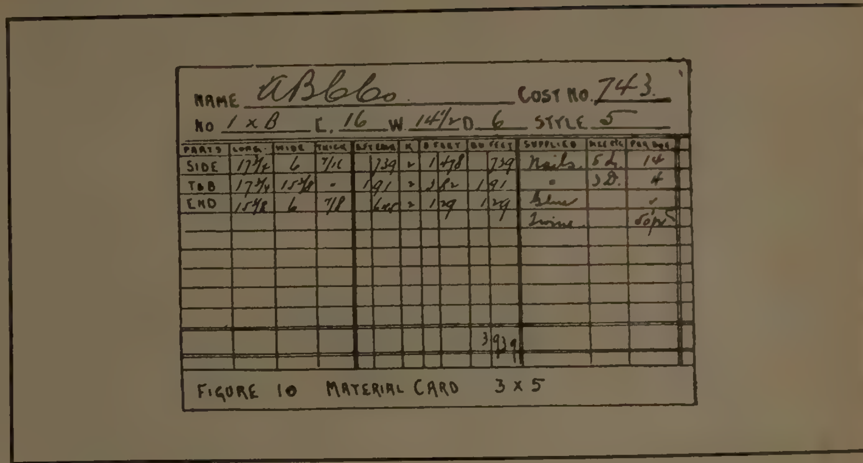

FIGURE 10 MATERIAL CARD 3 x 5

the f.o.b. factory value of the product. That is the amount of the total sales from which the estimated freight allowance has been deducted. The sales register should be ruled to show:

Date of sale.
Shipment number.
Name of customer.
Address.
Amount of invoice.
Freight liability.
Net credit to box account.
Number of feet shipped.
Distributing columns for the quantities of each kind of material (lumber).
Memorandum column for the notation of freight bills received.
Freight adjustment—Dr. and Cr.

From this source the information posted to the credit of box account is derived.

Without an inventory at the close of each month, of lumber, box parts, and finished product in the factory, the account is incomplete. Two forms are shown which will greatly facilitate the inventory work. The form shown in Fig. 8 is used for listing the lumber which has been charged to box account but not used, and the made-up boxes which have not been invoiced. The form in Fig. 9 is used for box

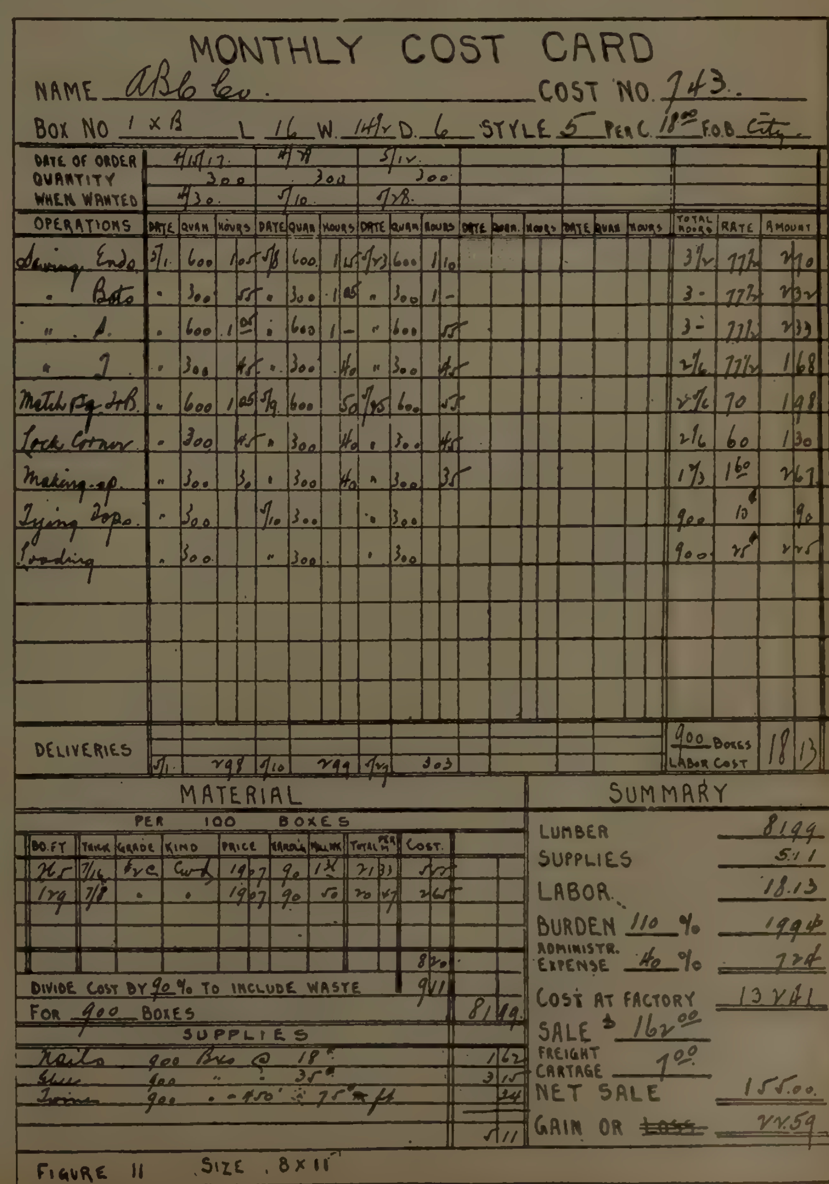

FIGURE 11 SIZE 8 x 11"

parts in the various stages of manufacture. This inventory is priced at cost.

It is believed that the form suggested for the box account and a physical inventory of work in process and finished is preferable to the keeping of separate accounts for:

Goods in process.
Finished goods.
Cost of sales.
Trading account.
Sales account.

This for the reason that the requisitioning of material of all kinds for every order is impossible, or at least impracticable, and the danger of error too great to permit the use of that method. The plan of charging material to production orders will be explained in the paragraph on job costs.

Out-Freight Account.—This account is credited at the close of each month with liability taken for freight on shipments. Entry originates in sales register. As freight bills are paid, or presented by the customer for credit, the amount is charged to this account and notation made in the memorandum column, provided on sales register for that purpose, opposite the respective item.

From time to time the difference arising between estimated and actual freight must be adjusted. Where the estimated freight exceeds the actual the difference is charged to out-freight account and credited to profit and loss. Where the actual freight is greater than the estimated the entry is reversed.

Reserve for Bad Debts.—This account is credited each month with an arbitrary reserve, against the accumulation of which uncollectable accounts may be charged from time to time. By charging profit and loss each month with a small percentage of the month's sales, probably from ¼ per cent. to ½ per cent. is ample. No single month will ever be burdened with a severe loss from this source.

Shavings and Sawdust Account.—To this account are credited the sales of this product; also the consumption thereof for fuel. This is a revenue account, and at the close of the month should be written into profit and loss.

Discounts on Purchases.—This account is credited with all discounts allowed by creditors, and at the close of the month is written into profit and loss.

The practice of useing these discounts as an offset against the cost of materials should be discouraged. Discount earned by prompt payment of bill is a form of interest. Such earning is an earning of capital, and cannot be used to diminish production cost.

Discounts on Sales.—This account is charged with all discounts allowed to customers, and at the close of the month is written into profit and loss.

This item is purely a commercial cost, and should, for that reason, be kept out of the production costs.

Sales Allowances.—To this account all allowances for shortages, breakage, and other claims made by customers are charged. The balance in this account is written into profit and loss at the close of each month.

Job Costs.—Once the plan of accounting proposed in the foregoing pages has been properly established then the matter of job costs can be undertaken with reasonable assurance that the results obtained will be fairly accurate. The records and accounts shown lead to a complete analysis of materials and other elements of cost, and it is the function of job costs to distribute these elements to the orders which constitute the product of the factory.

The job cost system, as ordinarily applied to manufacturing enterprises, contemplates a separate cost report covering each item on an order. Owing to the frequent repetition of orders for some sizes it is proposed here to make only one cost report per month for each size or specification manufactured during that period. This will greatly reduce the amount of detail involved under the other method, and at the same time places the results in such form that comparisons of manufacturing cost between several lots of the same size can be readily made.

Another feature which should be developed out of this work is the application of these figures to estimates for new work. This, however, we will dismiss from further consideration at this time, and deal with it in a separate paper at some later date.

It is probably customary in most factories to send into the plant a work order which contains all of the items ordered by the customer at one time. This greatly facilitates work in the shipping room, but does not serve the purposes of the cost department. It is therefore, necessary to assign to each specification a cost number which is to be shown on the factory order, and by which the workmen are to report the work they have performed. This cost number becomes a fixed means of identification, and is not cancelled until some change is made in the size or construction of the box.

Immediately upon the issuance of a work order one copy is turned over to the cost clerk, who makes out material card (Fig. 10). The net feet are figured in accordance with the method adopted by the National Association of Box Manufacturers, and the cards then filed in numerical order of job number, without reference to the name of the customer.

Prices of materials and grades and kinds of lumber are omitted from this card, because these are subject to frequent change. The purpose of the material card is to eliminate the necessity of figuring material for a size more than once.

At the same time monthly cost card (Fig. 11), having a corresponding number, is prepared, and all of the necessary headings are inserted. The monthly cost card is filed in the same manner as prescribed for the material card.

Monthly Cost Card

In arriving at the lumber charge applicable to any cost card the net feetage will have been entered from the permanent material card (Fig. 10), representing the size and specifications. Prices at which extensions will be made can best be obtained from the material records, as already shown. Grades and kinds of lumber are posted to the monthly cost card from the sawing report.

In the matter of supplies, it would be impracticable to attempt to compute the exact value of all nails, glue, inks, and similar items entering into each job. Certain arbitrary charges, however, can readily be arrived at, which, when applied against the job, will cover relatively the costs of these items. The value of nails entering into any order, for instance, can be computed by ascertaining the value of any one month's or, preferably, number of months' consumption, and making a division, using as a divisor the number of "nailing surfaces" made by all nailing sets for the month. The total can be ascertained in the following manner:

Ordinarily a box will have six nailing surfaces—four from the sides and two from the bottom into the ends. Lock-cornered boxes and single cleated ends would contain two nailing surfaces, while double cleated ends would have four. The number of nailing surfaces for the month would then be arrived at by taking from the nailers' production reports (Fig. 6).

Total nailed boxes multiplied by six.
Total lock corner multiplied by two.
Total single cleated ends multiplied by two.
Total double cleated ends multiplied by four.

To illustrate this method the following example is shown:

Cost of nails used during month	$439.45
Nailing done:	
63,927 boxes x 6	383,562
19,574 ends S. C. x 2	39,148
16,392 ends D. C. x 4	65,568
Total nailing surfaces	488,278

488,278/439.45

.09 per 100 nailing surfaces

Makes a cost for nails:

Per 100 nailed boxes	.54
Per 100 lock cornered boxes	.18
Per 100 pair S. C. ends	.36
Per 100 pairs D. C. ends	.72

The arbitrary rate arrived at in this way times the number of boxes in the job, would give a relative charge for nails. The ink values can be arrived at similarly by a charge per 100 impressions. Glue values, as well, should be arrived at by taking the cost of glue consumed for month, and using as the divisor in this case the total number of parts run at the lock-corner cutters, and on those matchers having a gluing attachment. The result would be cost of applying glue per 100 joints. The cost per 100 lock-cornered boxes would be that result multiplied by four, and the cost on matched boxes would be that result multiplied by the number of matched parts in the box.

As each day's production reports (5, 6, 7) are turned over to the cost clerk they are posted to the monthly cost card, against which they apply. The production reports are then recapitulated, to be used at the end of the month as a check against the total productive labor reported from pay rolls, and for such other statistics records as reference has already been made to. The extension of the productive hours, posted on each cost card, times the operation rate, will give the total productive labor value which applies against each cost card or job.

The cost card, up to this point, has been completed as to lumber, supplies, and direct labor. The additional items of factory burden and administrative expense can be best applied, as already mentioned, by means of percentages upon productive labor. The percentage which would absorb completely these burdens can be ascertained from a comparison of the total productive labor value for any one month with the overhead expense for the same months. By comparisons of these items covering a number of months, a flat percentage should be arrived at which could be used each month in adding the overhead charges.

The actual ratio of overhead to productive labor, however, will vary slightly from month to month.

In order to stabilize the cost figures, it is more satisfactory to use a percentage that is founded upon the experience of a number of months, rather than to change this rate at frequent intervals.

The total charges made on all cost cards for the month, as to lumber, supplies labor, factory burden, and administrative expense can then be drawn off.

The total of these items should then be augmented by the value of physical inventory of material, goods in process, and finished goods at the end of month, and reduced by the totals of similar inventories at the beginning of the month. The amount so arrived at constitutes the equivalent of these same elements charged into the box account. The inventories as they appear in the box account should not be used to modify the totals drawn from that source.

Should there be a considerable variation in this reconciliation, and it is determined to locate the cause of the differences, then, of course, it would be necessary to divide the two inventories into their component parts—namely, lumber, supplies, productive labor, and overhead—and to make the adjustment spoken of before with respect to each of these items individually.

The items upon the cost sheets of labor on work in process, or finished goods not billed, are not, of course, included in the current month's costs. These items will be carried over and form part of the labor cost for the following month's sales.

In the foregoing many details have been treated only superficially, for the reason that no matter what plan is proposed it would be subject to some modification to the local conditions in each plant.

The purpose of these suggestions will have been fulfilled if the general idea has been conveyed as to how the several elements of cost are to be displayed upon the general books and the basis for their distribution to the job has been shown.

Retailers Becoming Extensive Advertisers

"The retail lumber dealers of the United States are spending at least $700,000 yearly for advertising in their local papers," said R. B. Goodman, acting president of the National Lumber Manufacturers' Association, recently in an address at the annual meeting of the National Retail Lumber Dealers' Asociation. Mr. Goodman stated that at least 50 per cent. of the total lumber cut of the United States passes through the hands of the retail dealers, and that the service performed by the retailers through buying in carload quantities the great variety of special items, from shingles to interior finish, that must be assembled for a single building, together with their expert knowledge of materials, enables them to sell to the home-builder more cheaply than it would be possible for the sawmill men to do. The retailer carries in stock everything that is needed, and, if anything goes wrong, the buyer does not have to write letters about it. Matters are settled face to face. Mr. Goodman also spoke of the organizations of lumber manufacturers which have established definite and reliable standards of product, and of co-operation between the manufacturers and retailers in service to the public through the furnishing of plans for all kinds of buildings, assistance in advertising, and the dissemination of information upon the proper uses of the different kinds of lumber, of information upon the use of creosote to prolong the life of timber, fire resistant paints, and automatic sprinklers to reduce the fire hazard, and special uses, such as wood block pavement, hardwood flooring, etc., that have been developed as the result of the better merchandising of the product.

In referring to the unusual conditions brought about by the war, under which the entire lumber industry is now operating, he said: "This crisis has made, and will continue to make, enormous demands upon our industry. This situation demands of us more efficient organization in our industry to meet these demands. It is not only a matter of economic wisdom for the individual lumber dealer or the individual manufacturer to loyally support his trade association, but to do so has become a patriotic duty."

A Chat with a Live Dealer

With the dawn of the European turmoil the wheels of commerce slackened. The call to arms threatened to strangle industry.

The prophets in every city and hamlet of America were heard and the pages of the newspapers thrown open for their opinions. Through the trenchant pens of these gentlemen we learned of the starvation to come, the bankruptcies to follow, and the inevitable upheaval of the business world.

To-day France and England are manufacturing more merchandise than ever before in their history. They suffered changed conditions, readjusted themselves, and then acted.

War has not injured the growth of trade in general. That it has checked the development of certain unnecessary or menacing industries goes without saying. It has only changed conditions without swerving capital from its advantageous channels. Most people have mistaken these changed conditions for "dull times."

The progressive dealer has a more prominent backbone than a wishbone. He was not slow to see that as the French and English recovered from their shock so have we regained our former prosperity.

The hustler on catching a glimpse of the tail feathers of an opportunity chases it, gets a strangle-hold and makes it disgorge cash. If conditions change, he changes by going up a rung instead of setting the ladder aside for another day.

We should keep before use the lesson taught by the French and English. When things were altered they were met with new or modified method.—From "Doubling Your Winter Profits," issued by Morgan Sash and Door Company.

Lumber Company Uses Novel Advertising

The Smith-Robinson Lumber Company, Bemidji, Minn., not only believes in using very liberal advertising space in its local papers, but also in selling a completed house bill for a certain specified sum—that is, an entire ad. will be written regarding one house and a number of illustrations will show details of interest to prospective builders, all the building material for which will be sold for a definite amount. For example, one ad. that has met with much success shows a two-storey bungalow type of building. In the upper left-hand corner an illustration is shown of the completed house; in the upper right-hand corner another illustration shows the dining-room and part of the living-room, and forces home in a telling manner the charming effects to be obtained by the proper use of millwork for interior finishing. Just between these two illustrations appears the statement that the company will furnish "all the material for this home, including lumber, lath, shingles, windows, doors, casing, plaster, and woodwork throughout the interior, for $1,888.33, and you can inspect our grades." In addition, the company furnishes plans from which the house is to be built. Below the two large illustrations smaller ones are run, showing a floor plan of the lower floor and also one of the upper floor, while in the centre appears an illustration of a built-in kitchen cupboard that is sure to attract the attention of the housewife. The reading matter is given over, throughout, to describing the good points of the various rooms, as well as the sort and kind of lumber suitable for securing the best effects and, at the same time, making the best house. After carefully reading such an advertisement the prospective home-builder can hardly fail to feel as though the house had actually been inspected in person, and, unquestionably, the desire to own just such a home will be greatly stimulated.

Retailers' Advertising Creates Demand

Retail umbermen in Birmingham, Ala., have just discovered, after a campaign filled with interesting incident, that advertising creates a demand for lumber, just as properly displayed printed matter helps the department store man or the shoe dealer, says the American Lumberman. The Estes Lumber Company, one of the largest retail yards in the city, was the first concern that broke into print with retail lumber advertising. Since that time, during the last two months, many other concerns have adopted the policy, and the newspapers, billboards, and street cars have been ablaze with the tasty, "different" brand of ads that create a longing for home ownership and increase the zest for home-building.

"People do not care so much about the price per thousand feet for No. 1 common flooring as they do the eventual cost of a well-described little bungalow," said Mr. Estes, in telling of his plan. "I conceived the idea that the desire for lumber could be created by appealing to the home-building instinct, and now the lumber dealers who first thought I was wasting a lot of money by advertising are thoroughly converted to the idea. It has been amply demonstrated that publicity pays just as well in this business as in any other."

Most of the big retail yards are out in the suburbs, where space is not at a premium, and this isolation makes selling the customers difficult. To eliminate this disadvantage dealers have opened down-town showrooms that have been pronounced great novelties by visiting lumbermen. Offices in skyscrapers and front windows down town have been utilized in this way. Complete model houses are shown, with plans furnished free to buyers of the lumber, and instead of specializing on the cost per thousand feet, the house complete is shown and the lump cost entire is quoted. This has proved the most satisfactory method ever adopted by the local retailers, and all are pleased with the results.

U. S. National Retailers' Meeting

The National Retail Lumber Dealers' Association of the United States held its first annual convention at Chicago on September 7, and there were about 200 delegates in attendance. The secretary reported that the association had made gratifying progress and that the present membership included 287 firms. A number of excellent addresses were delivered by the officers of the association and by several of its members. Some of these addresses have been published in the Canada Lumberman of September 15 and in the present issue.

The Schroeder Company's Operations in Ontario

In the Canada Lumberman of September 15 a short reference to the logging operations in Ontario of the Schroeder Mills and Timber Company was published. In a letter from the company's head office at Milwaukee, Wis., they gave an interesting outline of their camp operations, from which we are able to publish a more complete description. The company is putting in six or seven camps along the Pickerel waters, and is planning to have them as commodious as possible. While modestly disclaiming an intention of making these model camps, the company is introducing features which will go far towards making the employees know that they are in good quarters where it will be wise to stay.

"Besides an earnest desire to make our employees as comfortable as is possible, considering the nature of the job," they say, "we also have in mind the fact that the best way to attract labor now, when it is so scarce, is to pay the men well, feed them and house them well. Accordingly we are making the sleeping quarters roomy, with plenty of light and ventilation, and as sanitary as vigilance can produce. Double-deck iron spring beds are being furnished, with regularly washed bed clothing. Separate rooms are provided for washing and dressing.

"Each camp will have a separate building, one half of which is designed for a bathhouse, while the other half will be a sort of lounging and reading-room, where literary pursuits can be enjoyed, and where the men can do their letter-writing in the evenings, undisturbed by the general conversation in the men's camp. All the camps will be laid out along the same general lines, and each will accommodate about 125 men.

"We expect to take out about 25,000,000 feet of pine this year, most of which will be driven to Georgian Bay by way of the Pickerel and French Rivers.

"Lauder, Spears & Howland, whose headquarters were formerly at Mowat, on the Canadian Northern, have joined us in the construction of the Key Valley Railway, which will connect the C.P.R. at Pakesley Station, five or six miles south of the Pickerel River, with the Lost Channel, a bay on Kawigamog Lake, through which the Pickerel River flows. This railroad will be about 10½ miles long, and is standard gauge built, with 50-pound rails. The Schroeder Mills and Timber Company will use this road for transportation of men and supplies to its camps, while Lauder, Spears & Howland will use the road in a small way for the same purpose, but principally to deliver to the C.P.R. at Pakesley the lumber which will be cut at their new mill, located at the westerly end of the Lost Channel. The railroad will, no doubt, be very attractive for the men, as by travelling over it they can reach our camps without tramping many miles through rough and muddy bush roads.

"We have moved our headquarters from Salines, on the Canadian Northern, to Pakesley, on the C.P.R., and have built very commodious buildings at that place. As the job will last six or seven years, we have endeavored to make the headquarters buildings and grounds quite attractive and well suited to the purpose for which they were designed.

"Our Ontario operations are in charge of Mr. James Ludgate, of Parry Sound, general manager, and James Ruxton, assistant manager.

"We are an American firm doing business in Ontario. Every man on the job is a Canadian—in fact, this has been the case ever since we started business there four years ago. We are delighted with our venture. The Canadians have treated us splendidly, and have shown so much good-will that we have a very warm feeling for them."

Oppose More Frequent Pay for Loggers

A deputation representing the sawmill operators has presented to the British Columbia Government a protest against the legislation passed at last session of the legislature establishing the semi-monthly pay-day in all industries employing labor in British Columbia. The deputation was to have been augmented by one from the loggers' association, but the latter, through a misunderstanding as to the date, failed to appear. During the discussion it was urged by E. J. Palmer, of Chemainus, that the logging companies now lost possibly four days at each monthly paying-off because of the bibulous inclinations of the loggers, and that a semi-monthly payday means eight days lost each month. He declared that he spoke from forty years' knowledge of the logger and his habits, and that the best thing that could happen to him would be some system whereby he would handle no money at all. J. D. McCormick of the Fraser River Mills, employing about 1,500 men, said that his company never has a pay-day without trouble, as a large proportion of the crew lays off at these times and imbibes freely. In his opinion two additional pay-days each month would mean more accidents, the records showing that 90 per cent. of the accidents in a logging camp occur immediately after pay-day.

The act requiring a semi-monthly pay-day throughout British Columbia becomes effective Oct. 1. As Canadian federal regulations require that employees must be paid in legal tender, thus precluding the use of checks, it means that large amounts of cash must be provided twice a month, which naturally involves considerable risk and inconvenience, especially in the logging industry, where hundreds of men are employed at long distances from any bank. No objection was urged to the semi-monthly pay-day as regards employees of mills, but in the loggings camps, it was strongly urged, the peculiar conditions require special treatment. The deputation representing the sawmill operators consisted of J. D. McCormick, H. H. Alexander, E. W. Hamber, E. J. Palmer, and J. W. Hackett.

The Shooting Season

"Conservation," in its September issue, says:

"September ushers in the shooting season, with the accompanying dangers from the presence of hunters in the woods. The sportsman is usually a smoker, often careless with matches and sparks from his pipe.

"This year, owing to the long dry spell, the wooded areas are especially inflammable. The least spark may be the cause of a conflagration, the result of which cannot be estimated.

"An appeal is made to sportsmen to be careful with fire, to refrain from smoking while in the woods, or, if this is impossible, to make sure that all matches are thoroughly extinguished and that live sparks do not fall on the dry leaves or grass.

"If camp-fires are necessary, guard them, and, when no longer required, extinguish them. Tramping out a fire is not positive; fires frequently follow dry roots into accumulations of dry material, only to break out again when fanned by a high wind.

"The destruction of the forest means also the destruction of the game and wild life therein, and it is therefore in the interests of the sportsmen, if for selfish reasons only, to be careful with fire."

Logging at the Top of the Big Smokies

We find on the northern slope of the Big Smoky Mountains that the stand of timber, as you get near the top of the ridge, becomes very light and of a very poor grade of hemlock; and, due to the fact that railroad building is a very expensive item, it is some problem to figure out how to get these logs without going to more of an expense than they are worth, says an article in "Logging." The Elkmont Contracting and Supply Company have worked out a very unique scheme whereby they are logging the long hollows which head out near the top of Clingman's Dome, and, by using a combination of different types of equipment, they have been able to do this work in a very satisfactory manner. The grades in these hollows range all the way from 15 to 30 per cent., and they have built a light incline of 36 in. gauge, using light tram cars which will handle about 1,500 feet to the car, pull these cars up the incline and let same down by means of a light incline machine, consisting of a hoisting engine with a drum so designed as to handle a sufficient capacity of rope, and equipped with a sufficient braking capacity to let these loads down with safety. In connection with this they have rigged up a small hoisting engine with a gravity swing loading boom for loading these cars, and it is their intention to use a light cable-way outfit to log out the slopes of these hollows, where the timber stands in sufficient number of feet per acre to warrant this class of work. In connection with this they are using teams to pick up the scattering logs. This equipment is operated by about twelve men, aside from the cutting and grading crews. They

feel at present that this system will be used with considerable advantage, due to the great shortage in labor in this section at this time.

At the foot of these inclines the logs are transferred to their standard gauge equipment by their regular loading equipment, consisting of the full swing type loader. The results obtained from this operation have been more than satisfactory—in fact, they are doing more than they expected with this outfit.

The Greater Cost of Handling Small Timber

Recent United States Forest Service investigations have disclosed some figures as a result of close studies of the cost of manufacturing lumber from large and from small timber that are unusually interesting. The tabulations presented show that the time required to skid 1,000 board feet in 16 ft. logs of 8 in. average diameter, small end, was 55 minutes; 14 in. logs, 28 minutes; 20 in. logs, 19 minutes. The logging time per 1,000 board feet was 29 minutes for 10 in. logs, 13 minutes for 14 in. logs, 6.6 minutes for 21 in. logs. A band sawmill operating upon oak had a daily capacity of 12,000 feet on logs 8 in. in diameter, while on logs 14 inches in diameter the same mill had a daily capacity of 30,000 feet; and the graphic curves were much the same for the band mill cutting in pine, although the curves were not so pronounced for two mills operating in poplar and chestnut intermingled with pine. The difference in sawing capacity was also not so marked as between large and small logs in the case of two circular mills, one working upon pine and the other upon hardwood.

Loggers Shun the Flowing Bowl

About fifty lumberjacks who have been fighting forest fires in Idaho were recently asked to go into Montana on similar work, but declined because they feared the effects of emigrating to a "wet" state after having spent many months in the "dry" states of Washington and Idaho. They admitted that they were likely to submit to temptation and burn their money for booze if they came into close contact with it, and they preferred to keep away from the danger.

Canadian Markets in South Africa

Better Demand for Deals—Douglas Fir Trade Requires Special Methods to Overcome Local Trade Customs—Three Years' Import Statistics

The Canadian trade commissioner at Cape Town, South Africa, in a recent report, states that owing to restriction on regular shipments and an extra demand for Douglas fir, many special efforts have been put forth to secure wood of all kinds from Canada. The ocean freight conditions prevented advantage being taken of the opportunity. It is, however, satisfactory to report that Canadian deals are and will be in better demand, and that the first sample lot of special quality Douglas fir lumber tested by the South African Government railways has proved so satisfactory that a repeat open order has been placed and tenders issued making demand for big quantities.

The handicap to Douglas fir seems to be an inclination on the part of the regular importers to avoid dealing in the special grades of Douglas fir, due to the fact that profits are liable to be more limited than they are on a cargo of, say, merchantable, the Canadian shipments of which are such an average high grade that the dealer here has been accustomed to make his own grades, and often the bigger percentage of a cargo has been sold as a mark above merchantable, while the inferior part of the shipment has been sold at good profit as merchantable.

These conditions the British Columbia trade will have to meet in some way, such as stocking in South Africa, or representation, which will have the effect of forcing regular dealers to handle "railroad quality" and others in the lumber, and will be helpful in introducing shingles, doors, windows, shooks, staves, and every other line which can be manufactured in Canada from the British Columbia woods. As far as I can learn, only one South African firm has made any effort to quote on Canadian timber tenders as submitted by the South African railways.

In lumber, rough or planed, Canada's 1915 shipments to South Africa were 1,254,212 cubic feet, valued at $271,300, and in 1916 the value was $254,300 for 960,543 cubic feet.

Flooring and Ceiling—Imports

Flooring and ceiling imports during recent years have been as follows:

Year.	Total for the Union.	Canada.	United States.	United Kingd'm.	Sweden.	Norway.
1913	$1,229,000	$13,000	$20,700	.....	$867,000	$313,000
1915	365,000	15,400	6,500	.....	168,500	173,800
1916	668,600	8,500	4,500	420	329,000	319,400

Sweden's shipments in 1916 were 587,525 cubic feet, compared with 2,830,614 cubic feet in 1913. Norway was able, with Sweden, to ship through the danger zone about the same quantity in 1916, delivering in South Africa 571,407 cubic feet. Norway's 1913 shipments were 1,026,397 cubic feet.

These countries score because they are able to ship to standard grades, and have plenty of low grade for shipment.

Russia's best year of export in this line was 1913, when she shipped 39,421 cubic feet, at a value of $10,600.

Imports of wood, planed and grooved (other than flooring and ceiling), were as follows:

Year.	Total for the Union.	Canada.	United States.	United Kingd'm.	Sweden.	Russia.
1913	$145,000	$57,800	$59,800	$3,100	$15,200	$3,900
1915	58,600	14,600	32,000	490	9,200	105
1916	61,000	28,700	27,300	175	1,450	95

If the above table is coupled with the flooring and ceiling imports it will be seen that on both entries Canada made good headway over 1915 in value, but in comparison with 1913 there is a big drop, all due to restricted ocean freight. Norway and Japan shipped small quantities under this heading in 1916.

Pine, Unmanufactured—Imports

Imports of unmanufactured pine were valued as follows:

Year.	Total for the Union.	Canada.	United States.	United Kingd'm.	Sweden.	Norway.	Russia.
1913 .	$2,518,000	$151,000	$521,000	$170	$1,254,000	$503,00	$75,800
1915 .	1,129,000	148,000	240,800	5	593,000	159,000	30,600
1916 .	2,802,000	110,400	258,000	..	1,305,000	190,000	213,200

Canada's figure of trade under this heading dropped from $352,000 in 1910 to $145,000 in 1912, and an advance was made in 1913 to $151,000, followed by another increase in 1914 to $196,000, and again a decrease during the past two years, due to limited ocean tonnage for lumber.

In normal times there is an additional market to the above table, as the South African Government stores purchases average each year about $229,000.

Imports of wood and timber, unmanufactured, N.O.D. (all except oak, pine, poplar, planed and grooved), were as follows:

Year.	Total for the Union.	Canada.	United States.	United Kingd'm.	Australia.	Russia.
1913	$290,000	$50,000	$52,300	$4,800	$81,000	$67,800
1915	176,700	85,800	33,400	1,350	53,700	2,300
1916	163,700	80,500	36,000	3,200	36,000	.....

The total imports in 1913 under this heading were 1,098,684 cubic feet, which dropped to 487,469 cubic feet in 1915 and 396,800 cubic feet in 1916. Canada's trade under this heading continued to improve, and will do so in the future, as the South African box shook manufacturers are using more of the Canadian spruce deals for their plant. Quality of and improvement in regularity of cut is the factor which makes the Canadian deal popular. If our Canadian box shook manufacturers were to adopt machinery as used in Sweden, they would then be in a position to compete in box shooks, which would be to Canada's advantage. Poplar imports in normal times average about 90,000 cubic feet, and Canada has shipped occasionally small quantities. More of this wood should come from Canada; it is used as a shelving and by the cart and carriage manufacturers in South Africa.

Box Shooks—Imports

Imports of box shooks were valued as follows:

Year.	Total for the Union.	Canada.	United States.	United Kingd'm.	Sweden.	Norway.
1913	$452,000	$ 345	$ 4,600	$68,100	$313,000	$50,500
1915	510,000	8,700	2,100	36,500	415,700	39,100
1916	919,000	9,000	8,500	56,000	777,000	57,500

During the past two years some headway has been made, and some sample orders have been placed with British Columbia manufacturers. Sweden with machinery that uses up all waste wood in this industry, has controlled the trade, and, with Canada's supply of raw material, it only requires up-to-date methods to secure a valuable trade which is going to be very much larger owing to the immense development of the fruit and other South African industries.

Many trade enquiries have been submitted, without any real results as yet, but there is every hope that, with fair shipping conditions from the Pacific, British Columbia will secure a good share of this trade.

Eastern Canada should also make an effort in this article, as it is a permanent and growing demand.

The city of Cleveland, Ohio, is very short of houses, particularly those required by the working people, and a plan is being worked out for the creation of a stock company comprising many manufacturers of Cleveland for the building of workmen's homes. All the houses will be constructed of wood, with concrete and brick trim. None is expected to cost more than $4,000, including the cost of the lot. Rentals will be in the neighborhood of $20 per month, and attractive terms will be made to encourage workmen to purchase their houses.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) $2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted—Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Maple Squares Wanted

Wanted to purchase for export in 1918 one million feet Maple Squares: 1¼ in., 1½ in., 1¾ in., 2¼ in., 2½ in.; lengths, 12 in., 18 in., 24 in., 30 in., 36 in., 42 in., 48 in.

State price air-dried and bundled f.o.b. cars. State shipping point. Box 625, Canada Lumberman, Toronto, Ont. 18-21

For Sale—Lumber

For Sale

A limited number of cedar Telephone Poles, 25 ft. to 35 ft. long. Also a few cars 8 ft. cedar fence posts, 4½ in. and up at top. For particulars apply Lynch & Ryan Lumber Co., Marmora, Ont. 18-21

For Sale

Can make prompt rail or boat delivery of from 3,000 to 5,000 pieces of Jack Pine Piling, from 40 ft. to 70 ft. long.

The New Ontario Timber & Trading Co.,
17-20 Sault Ste. Marie, Ont.

Lumber For Sale

300,000 ft. B.M. 1 x 4 and up Clear and No. 1 Spruce.
400,000 ft. B.M. 2 x 4 to 2 x 10 Spruce.
Piled widths and lengths separate.

GEO. C. GOODFELLOW,
c Montreal, Que.

Hardwoods For Sale

1½ in. and 2 in. Hickory and 1 in. and 1½ in. Plain White Oak, 1st and 2nd. Also several cars of Birch and Whitewood or Poplar. All dry. Also 2 in. merchantable and Crating Spruce.

J. P. ABEL, FORTIN & CO.,
19-19 Maisonneuve—Montreal.

For Sale—Machinery

Machinery For Sale

One 36 in. planer, roll feed, with countershaft.

One Jackson & Cochrane 24 in. planer, roll feed, with countershaft.

One 36 in. two drum sander, Cowan & Co.

R. W. NICHOLSON,
18-21 Strathroy, Ont.

For Sale at Smith's Mills, Que.

1 40 in. Crocker Turbine Water Wheel.
1 75 h.p. Corliss Engine.
1 Clapboard Machine.
1 Waterous Lath Machine.
For price and particulars write

THE VALLEY LUMBER CO.,
19-20 Smith's Mills, Que.

Machinery For Sale

1 Goldie & McCulloch Engine, 16 in. x 38 in. Complete with Heater, Pipes, Oil Pump, etc. In first-class condition.
1 Holmes Matcher.
1 Band Rip Saw.
1 Dynamo Engine, Jewel No. 3.

R. Laidlaw & Co., 65 Yonge Street, Toronto. 19-23

Machinery For Sale

A Light Planer, Matcher and Moulder.
12 in. 4-side Moulder.
Power Feed Rip Saw.
Trim Saw. 12 in. Jointer.
Dry Kiln. Lighting Plant.

A. J. LINDSAY,
94 Pembroke Street,
17-20 Toronto, Ont.

For Sale

No. 5 Double Bale, Geared Screw, Power Shaving Baling Press, manufactured by the P. K. Dederick Sons, Albany, N.Y.

Capacity two bales, about 30 in. x 16 in. x 16 in., weighing approximately ninety pounds each per stroke of machine.

This machine has been in use but five or six months and is in first class condition.

It will be sold at a bargain.

THE DE LAVAL CO., LTD.,
19-22 Peterborough, Ont.

Circular Saws

1 70-in. Circular Saw, 5 and 6 gauge, 2 in. hole, 90 teeth.
1 72 in. Circular Saw, 5 and 6 gauge, 2¼ in. hole, 90 teeth.

Could make alterations in hole, hand or speed to suit. These saws would cost new today $300 each, but we are willing to accept any reasonable offer. Anyone that can use them can secure a bargain.

The James Robertson Co., Limited,
19-19 Toronto, Ont.

Wanted—Machinery

Boiler Wanted

300 H.P. Heinie Water Tube Boiler, 3½ in. Tubes, 18 ft. long or less, second-hand equipment in good condition. Oliver Chilled Plow Works of Canada, Limited, Hamilton, Ontario. 19-19

Refuse Burner Wanted

Second-hand Refuse Burner in good condition, 12 to 15 feet in diameter, and moderate height. Address with full particulars and price.

REAMSBOTTOM & EDWARDS,
19-19 Connaught Station, Ontario.

Wanted—Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

WANTED POSITION as trimmer man, air lift; five years' experience mill cutting, 150 M. daily. Address Z. T. Harlow, Crossburn, Nova Scotia. 18-21

YOUNG MAN, six years' experience as stenographer and bookkeeper in lumber business, desires change. Best of references. Box 629, Canada Lumberman, Toronto, Ont. 19-2

WANTED POSITION AS BUYER for good lumber firm in States or Canada. Have over 12 years' lumber experience. Box 23, Canada Lumberman, 119 Board of Trade, Montreal, Que. 18-19

EXPERIENCED LUMBERMAN with good selling connection in Montreal and vicinity, is desirous of establishing a connection with a reliable lumber manufacturing firm in Spruce and Pine on a commission basis. Highest reference. Box 623, Canada Lumberman, Toronto, Ont. 18-19

POSITION WANTED—As Manager or Office Manager with lumber and woodworking business. Twenty years' practical experience in all departments, including lumber factory and office routine. 15 years with one large Ontario company. Have always made good; best credentials. Now engaged. Apply Box 624, Canada Lumberman, Toronto, Ont. 18-19

COST ACCOUNTANT, ineligible for Overseas Service, having had four years' experience in Mill Work Costs, and an additional three years as an assistant with one of the foremost Accounting firms of Canada, desires a position where he can control and operate the cost accounts of a large woodworking and contracting concern. Good references. Mr. Howe, 1401 Royal Bank Bldg., Toronto. 19-20

Business Chances

Sawmill For Sale

Complete Sawmill for sale, cheap and easy terms. Capacity 20,000 feet per day. Field Lumber Company, Limited, Field, Ont. 11-t.f.

Saw Mill For Sale

Complete Sawmill with timber rights and freehold lands for sale. excellent shipping facilities. Mill situated County of Shefford, with a visible supply of soft wood and hard wood timber in the neighborhood for an extended life. Address P. O. Box 222, Waterloo, Quebec. 16-t.f.

For Sale

Timber Limits and Sawmill, estimated fifteen million feet of hardwood and ten million feet soft woods. Sawmill capacity 25 M. feet, shingle mill 125 M. Docks, tug, booms, logging outfit, houses, etc. Price $35,000.

The Manitoulin Lumber Co., Ltd.,
11-22 Walkerville, Ont

Jobbers Wanted

We wish to let several contracts to take out logs on Berth No. 6, being broken front lying between the Magnetawan and French Rivers. This berth is all convenient to Canadian Northern Railway.

John Harrison & Sons Company, Limited,
Saw and Planing Mills,
9-t.f. Owen Sound, Ont.

Timber Limits and Saw Mill For Sale

Five and one-half miles of Crown Timber Lands, containing approximately 10,000,000 ft of Hardwood and Spruce Timber, situated on the Laurentian Branch of the C. P. R. Exceptional opportunity for anyone who is in the manufacturing trade.

CARDINAL & PAGE,
180 St. James Street,
19-19 Montreal, Canada.

Mill Plant and Limits For Sale

43 Miles Limits on 31 Mile Lake, Gatineau Valley, containing Basswood, Spruce, Fir, Pine, Cedar, Birch, Maple and Pulpwood.

New Waterous 8 ft. Improved Double Cut Band Mill complete. Steam Alligator, Boats, Sleighs, Wagons, Harness, etc. For further particulars apply to

A. W. STEVENSON,
P. O. Box 2624,
8-t.f. Montreal, Que.

For Sale

About five or six tons of ⅝ and 9/16 tested chain in lengths from 27 ft. to 30 ft. with ring on one end and hook on the other end.

Address Drawer "F," Sarnia, Ont. 19-t.f.

Wanted

Sawmilling and logging contractors to manufacture 100 acres of timber near Guelph. Two miles from railway. Operations to start in two weeks. Apply H. G. Cockburn & Son, Guelph. 19-19

Sawmill For Sale

Saw, Shingle and Planing Mill in Bayfield, on Lake Huron, will be sold at a bargain. Practically new and cost over $6,000, and will be sacrificed for $4,500 on easy terms. Plenty of available timber for this mill which will make more money than the best 100 acre farm in Huron County.

This is a gold mine for the enterprising man with small capital. Apply to

JNO. B. MUSTARD,
19-22 Brucefield, Ont.

Valuable Water Power

and 162 Square Miles of

Valuable Timber Limits

FOR SALE BY PUBLIC AUCTION

The limits are on the river, Mississippi Branch, a tributary of the Madawaska, and Water Power at Eganville, Ont., on the Bonnechere River. These will be offered for sale by Chas. M. Henderson & Co., Auctioneers, at their office, 128 King St. East, Toronto, Ont., on **October 30th, 1917, at 2 o'clock** p.m. The Limits will be offered in three parcels, as follows:

Parcel No. 1—
Comprising parts of the Townships of Mayo, Carlow, and Raglan, license covers in all 65 square miles, a great portion of which is deeded or located lands.

Parcel No. 2—
Comprising two parts of the Township of Cashel in two licenses, covering 18½ square miles, well timbered.

Parcel No. 3—
Comprising parts of the Townships of Ashby and Effingham in all 78½ square miles; well timbered. This parcel also includes lots 29 and 30, Con. 10, Mayo, making 100 acres (more or less), on which is located a valuable water power, known as the Big Chute, situated five miles from the terminal of the Bessemer & Barrys Bay Railway.

All this country was cut over some years ago for the pine, of which there is considerable left, along with large quantities of Birch, Maple, Ash, Elm, Hemlock, Cedar, Spruce, Balsam, and Basswood, suitable for sawlogs, also pulp wood, railway ties, and large quantities of hardwoods for chemical purposes and a great growth of young pine.

These limits are close to the Central Ontario Ry. on the West, a branch line of which runs in the Childs Iron Mine in the Township of Mayo, from L'Mable Station. They are also easily accessable from Barrys Bay, on the Grand Trunk Railway.

The Sale will be subject to all conditions and regulations of the Department of Lands, Forests & Mines, affecting same. The licenses permit the cutting of all kinds of timber, except on deeded or located land.

The reason for selling is for the purpose of closing up an Estate.

Terms of sale regarding limits, 25 per cent. of purchase money down, 25 per cent. 1st of July, 1918, balance 1st of July, 1919, bearing interest at 6 per cent. per annum. A liberal discount can be arranged for cash. Transfer of license will be made on final payment, purchaser bearing cost of transfer.

There will also be offered for sale a valuable Water Power, with a cement dam, and the stone walls of a flour mill; the latter was burned in 1911. This is in the centre of a thriving village served by the C. P. R. and G. T. R. Railways, a good manufacturing site.

Terms for the Water Power: 25 per cent. cash on day of sale, balance can be arranged.

Any further information regarding these properties will be furnished by writing the undersigned.

The properties are offered for sale subject to a reserve bid.

GEORGE B. FERGUSON,
Renfrew, Ont.
August 30th, 1917. 18-20

AUCTION SALE OF TIMBER BERTH.

THERE will be offered for sale by public auction at an upset price to be made known at the time of sale, at the office of the Indian Agent at Kenora, Ont., on the third day of October, 1917, at the hour of three in the afternoon, the merchantable pine, spruce, cedar, tamarack and balsam fir of ten inches and over in diameter eighteen inches from the ground, growing on the Indian Reserve No. 35 C situated at Assabaska or Sabaskong Bay in the Lake of the Woods, near the town of Kenora, Ont.

In addition to bonus, the purchaser shall pay Crown dues under sworn returns furnished by a licensed culler, as follows:—

Pine	$2.50	per M. ft.	B.M. or	$25.00	per M.	cu. ft.
Spruce	1.25	"	"	12.00	"	
Cedar	1.50	"	"	15.00	"	
Tamarack	1.50	"	"	15.00	"	
Balsam	.80	"	"			

All logs over eighteen feet in length to be scaled under the cubic foot standard.

The berth will be offered at a bonus, ten per cent. of which shall be paid at the time of sale, forty per cent. within thirty days and the balance or fifty per cent. within one year from the date of sale, and satisfactory security must be provided for payment of the outstanding balance.

A license will be granted to the purchaser, and the timber must be removed under regulations of the Departmnt, a copy of which may be secured upon application to the undersigned or to the Indian Agent at Kenora, Ont.

Ten years will be allowed for the removal of the timber from the Reserve and the license will be renewed yearly for this period upon compliance with all the conditions thereof and upon payment of the usual renewal fee and ground rent.

Half of the cost of adequate fire guardianship will be a charge against the licensee, and the safe disposal of brush, tree-tops and other debris resulting from the lumbering operations must be arranged for under the supervision of the Department.

Any further information may be obtained on application to the undersigned or to R. S. McKenzie, Indian Agent, Kenora, Ont.

The unauthorized publication of this advertisement will not be paid for.

DUNCAN C. SCOTT,
Deputy Superintendent of Indian Affairs.

Department of Indian Affairs,
Ottawa, August 22, 1917. 19-19

Timber For Sale

Standing Mixed Timber estimated at 280 acres, for sale in St. Etienne de Bolton, near Bolton Centre. The Canadian Last Block Company, Limited, 135 Carriere St., Montreal. 18-19

Tide-Water Stumpage
For Sale or Exchange

For sale, or will exchange for good ranch or farm land, B. C. Tide-water stumpage, cruised and surveyed.

CARL BLOCK,
19-t.f. Peoria, Illinois.

Contract Wanted

Party can deliver two million feet of timber on C. P. R., in the course of next winter, same quantity for five years or more; three-quarters Birch, balance Maple, Basswood, Spruce and Hemlock. Knows the lumber trade and is efficient organizer. What is needed is finance, and no fair contract will be overlooked. Box 627, Canada Lumberman, Toronto, Ont. 19-19

Why Mahogany Is Costly

Mahogany timber primarily is no more highly valued in its native country than many of our own familiar woods. The things which make mahogany costly to the consumer in this country are the difficulties encountered in locating, cutting, and bringing the timber to market.

Some of these cost items are set forth in detail in a recent consular report on mahogany production in Guatemala. This report says it costs $12 per 1,000 feet to load mahogany logs on ships. There is a cost of $15 for railway transportation, and the ocean freight, which we generally figure low, runs from $15 to $20 per 1,000 feet.

These items of cost tell their own stories of the difficulties encountered in railway transportation and loading. Twelve dollars per 1,000 feet for loading logs on shipboard would sound like a hold-up price in this country, but this loading is done in localities where labor-saving devices are scarce and many difficulties are encountered.

It is pretty much the same story in the matter of railway hauling. Most of the timber is no more than twenty-five miles from the coast, yet often there is a railway charge involved running up to $15 per 1,000 feet. The ocean-going freight is uncommonly high at the present time, but the other items of cost are not unusual, and they serve to illustrate graphically why it is mahogany timber is high by the time it reaches the consumer. Perhaps some day we shall be able to introduce more modern methods, and cut down some of these items of cost. Meantime, however, other items involving increased expense will likely accrue, such as having to go further into forests after the timber.

Remarkable Redwood Burl

Rodney Burns, manager of the Stump House of the California Redwood Burl Company at Eureka, Cal., has secured one of the most interesting curiosities to be found in any part of the world. A redwood burl nine feet in diameter and weighing nearly seven tons has been brought in from the logging woods near Metropolitan, and is now on exhibition at the Stump House, corner of Broadway and Clark Streets, where it may be seen at any time. In a few weeks the novelty, unusual even for the home of the redwoods, will be shipped to the Emporium, San Francisco, where it will be placed on exhibition for a time. Later it will be sent to Los Angeles, and, after exhibition there, will be sent to other large cities of the United States. Portions of the big sphere will be polished in order that inspection will show the texture of the burl and the high polish it takes.

Why nature took it into her head to build a sphere of almost granite-like wood around a redwood tree, doing her extraordinary work 150 feet above the ground, scientists have been unable to explain. However, she accumulated nearly seven tons of hard and flinty elements, and when, subsequently, the soft portions of the tree were burned away the big sphere was left with a hole some thirty inches in diameter through its centre.

It is doubtful if this curious formation could be duplicated anywhere in the world. Nature does not play the same prank twice, and what she has done this time is well worth seeing.

Hollow Concrete Poles

A somewhat curious new process has been put into practical use in this country in the manufacture of hollow concrete poles. Wet concrete is put into a circular form in quantity insufficient completely to fill it, and this form is then put in a special form of lathes and rapidly whirled. Centrifugal force throws the concrete to the outer portion of the mould, leaving a hole in the centre. The centrifugal pressure developed is 75 to 300 pounds per square inch, which forces much of the water in the mass to the centre, and this runs out at one end of the form. The plan also provides for proper reinforcement. Such a pole is 50 per cent. lighter than a solid concrete one of equal strength, but is slightly heavier than cedar poles of equivalent strength.

Lumber in the War

Estimates prepared by the lumber committee of the advisory commission of the United States Council of National Defence show that 2,000,000,000 feet of lumber may be used for purposes directly connected with the war in the next twelve months. This sounds large, but is actually about 5 per cent. of one year's lumber production of the United States. Construction of the sixteen cantonments to house the new army required about 500,000,000 feet. Second in quantity required comes the wooden shipbuilding program, now estimated at 400,000,000 feet.

Review of Current Trade Conditions

Ontario

Not much that is new can be said about the market situation in Ontario. Interest is pretty evenly divided between the logging situation and the effect of the reduction in the output of munitions. As to logging, it is perhaps a little too early yet to venture a definite opinion about the quantity that will be taken out of the woods during the coming winer. The labor market is still very uncertain. A number of reports received by the Canada Lumberman indicate that labor is very scarce, and that the output during the coming winter will be even less than it was last winter. Reduced operations on the part of some manufacturers, however, may be offset by the presence of new operators in the field, who will take out large quantities of stock. Moreover, the labor shortage may yet improve sufficiently to enable operators to take out a substantial stock.

Just at present the foreigners are dominating the labor market. They are holding out for high wages, taking the position that, as most of the native-born woodsmen have gone to the war, the manufacturers will have to pay high wages for such labor as is available. A little later on, however, when the harvesters return from the West, this situation will probably be altered. About the end of November or early in December improvement of this nature may be looked for, and operators who have not yet commenced logging to any important extent may then find it possible to go into the woods on a more normal scale. This belief is held by a number of manufacturers.

The munition situation is difficult to size up. More or less contradictory interpretations have been made of the announcement in the House of Commons upon this subject, and it may be that the latest statements by the Miniser of Finance and the Minister of Trade and Commerce mean that there will still be large quantities of munitions made in Canada, for which shell boxes will have to be furnished by the woodworking industry. Nevertheless, the situation to-day is that shell box plants in many parts of the country are completing their contracts and not receiving new ones, with a result that large numbers of employees are being laid off. If the shell box production is being reduced permanently it will probably have a considerable effect upon the market. Large quantities of spruce were used in these boxes, and it is current talk at the present time that prices of spruce may be expected to drop. Hemlock is also said by some manufacturers to be in for a lower price. It would not be wise to take too strong a stand, however, on either of these lines, as a great deal will depend upon the outlook during the coming winter and upon the trade situation that develops in the United States. Across the line just at present there is a good demand for spruce for many purposes connected with the war. The building situation in the United States, however, is exceptionally quiet, and it looks as though building operations are rapidly approaching the quiet level which has prevailed in Canada for many months.

It is not possible to sum up the various factors that are affecting the market to-day and to balance them off in such a way as to reach a safe conclusion about the course of prices in the immediate future. The different factors are of such importance that any of them may prove to be more effective than the others, and thus upset one's calculations. Apparently the majority of the trade, in all its branches, are inclined to play safe, although manufacturers are showing sufficient confidence in the market to go into the woods as far as they are permitted by the labor situation, in spite of the fact that stock taken out this winter will cost them much more per thousand feet than it did last winter.

The Ottawa market continues quiet, but stocks are low in a number of cases, and prices have been advancing, particularly for good pine sidings and strips. Red pine also is firmer. Spruce prices are steady. It is thought that the higher prices for the upper grades of pine are the result of lower grades having advanced in price some time ago and continued at a high level. The upper grades are now following in sympathy. Shell box production has largely come to an end at Ottawa, and many employees are now out of work. There is considerable speculation as to the effect this will have on the price of spruce, but opinions vary on this subject. The high prices for pulpwood are counted upon by some lumbermen to keep spruce lumber prices from falling.

Eastern Canada

More encouraging conditions are reported from St. John, N.B., during the past fortnight. A number of mills have closed down for the season, and some of the large ones will be following suit presently. The American market is firmer, and spruce is now selling on a $40 basis, which is an advance of $1. There are about thirty or thirty-five million feet of lumber in stock at St. John, which is not considered excessive, as large quantities of deals are being shipped to the United States. A revival of the English demand would probably stiffen prices to a great extent, as it is not thought now that there will be any surplus. Pine stocks are low, and are expected to continue so. Local trade is quiet. Woodsmen are scarce, and are being paid about $45 per month. It is expected that the output this winter will be lower than usual.

The spruce trade in the Eastern States is very strong, and, while the house-building trade is practically dead, there is sufficient other business to more than offset this. Industrial operations are steadily demanding more and more Eastern lumber. Shingles, lath, and clapboards are still weak at Boston. Prices are reported to be a bit easier. The outlook in the shingle market is not encouraging. Hardwoods are dull, but prices remain firm on account of the heavy requirements of the government.

Prices of Eastern spruce in the New England States have recently shown quite an advance, though as yet it is not possible to say whether the higher prices will be maintained. Some manufacturers are asking a good deal more for random spruce than others. The higher prices are probably the result of a conviction among the trade that Eastern spruce lumber is worth more than it has been bringing. No decided increase has taken place in the demand. There is a good market for spruce frames 8 in. and under, on a $40 basis. Random is rather quiet. The outlook in the New England States is for a quiet trade during the fall, although there is still a lot of war business to be put through, which will help to keep things moving. Retail yards are doing practically nothing, purchasing only what is absolutely necessary for current trade.

The demand for pine at Boston is almost entirely for manufacturing purposes. Building operations are at a standstill on account of the high price of spruce frames and common lumber. It is expected that building operations will be continued throughout the winter.

Great Britain

Stocks have been reaching London a little more freely of late than formerly, and the volume of business on the spot market is keeping up fairly well. Fresh transactions are reported right along, but they are not extensive. Importers and merchants are really doing only a small trade. The output of the home timber industry is gradually increasing. The packing trade is very busy, and is consuming all the suitable material it can obtain. All classes of goods at the London public docks show decreases as compared with the stocks a year ago. There is quite a falling off in deals and battens, but the stocks on hand are expected to last considerably longer than they would in normal times.

Reports from Liverpool draw attention chiefly to the insignificant volume of importation, on account of the lack of steam tonnage. Stocks also are very short, and are likely to become still scarcer, in spite of the curtailment which is taking place in the rate of consumption. If rigid curtailment were not being practised the quantity available to-day would not last more than a few weeks. This situation applies equally to Manchester. There is an urgent call on the part of all merchants for a removal by the government of the various restrictions that are keeping the lumber trade at a standstill. There are no indications at present, however, of the removal of any of these restrictions. Importations of pitch pine, small enough of late, are being restricted still more by the great demand in the United States for heavy timber for the construction of wooden vessels and for many other purposes connected with the war. This, together with the shortage of tonnage, is keeping transactions in pitch pine down to a minimum. Stocks of pitch pine at Liverpool are almost nil.

Reports from Manchester state that prices in the timber trade have now reached three times those prevailing in 1914. It is reported, moreover, that a movement is on foot to increase the selling prices of timber still further. The shortage of hardwoods at Manchester is becoming more acute, and prices are abnormally high. Customers in search of hardwood have to face a continually rising market. Manchester yards in general are almost depleted of imported timber available for sale, but English timber is to be seen everywhere. At Southampton a similar state of affairs exists in regard to available stocks, and merchants are expressing opinions about the government's restrictions which are far from complimentary.

There is no alteration to report in the state of the timber market at Glasgow. Imports of 1,100 standards of white sea red and white deals for government account were recently reported. Trade generally is on very quiet lines, the movement being confined almost

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

exclusively to requirements for war work. Box making continues very active, and stocks for this purpose are moving steadily from the public storage grounds. A few sales of pitch pine and Oregon pine are reported for shipbuilding purposes.

United States

The general industrial and trade situation in the United States gives promise of an active fall. The volume of trade is increasing steadily, and seems to be limited only by the shortage of labor. There is considerable caution, however, about taking on new responsibilities, as an impression seems to prevail that prices have reached their highest limits in many lines and are likely to come down. The crop outlook continues to be excellent, and the farmers of the country are in a strong position, so that they do not need to market their products immediately.

Stocks of lumber in the hands of Southern pine manufacturers have been greatly reduced since midsummer. A large part of the business during the past three months has been from the government. The demand from the regular trade has not been up to normal, but is picking up to some extent. Moreover, the government business promises to last for some time yet. There are some soft spots in the market, caused by the large government demand having been for special grades, making it necessary to dispose of other lines at reduced prices. Manufacturers of Southern pine are agreed that during the present fall their problem will be to produce stock, not sell it.

White pine stocks are scarce. There is still a strong market for the lower grades used for box making and crating. As the government war pans develop it is becoming evident that there will be a very large demand for good, substantial wooden boxes. White pine prices continue firm. The market for spruce in the Eastern States is strong, as a result of low stocks, small production, and heavy demand. The government's position in regard to Pacific Coast spruce still seems to be doubtful, but there is no question that every available piece of spruce that can be used for aeroplane construction is needed. There is a good market in the East for hemlock, and prices continue very firm, with an upward tendency.

The labor troubles on the Pacific Coast seem to have been pretty well disposed of, and most of the mills have resumed operations on a ten-hour basis. There is a good demand for special cutting bills, and all sawmills are operating to capacity in this line. The outlook for a good logging season is encouraging. The volume of business placed with the fir mills shows an increase. Reports from 144 mills show that production during the week ending September 8 was 50,346,095 feet below normal. Orders received were 10,021,915 feet above actual production. The factory demand for hardwoods shows an increase, largely on account of the demand arising out of the war.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade Showing Improvement

St. John, N.B., Sept. 20.—(Special to the Canada Lumberman.)—A steadying influence has crept into the lumber market during the last two weeks. Many of the smaller mills have finished their season's cut and are shut down, and in a few days some of the large mills will have ceased sawing. This leaves only a few of the largest mills going, and they will not run long after the cold weather comes. Stocks have been absorbed in the American market a little faster of late. The price has risen from a $36 base to a $40 base. This means that largely all stocks are worth $28 to $32 per thousand feet at the mills for narrow American sizes, such as 2 x 3, 4, 6, and 8 in., with $2 to $3 per thousand feet more for wider widths. How long this will continue remains to be seen, but the manufacturer certainly needs it, as this has been, and is now, the most expensive operating year in the history of the lumber trade.

Stocks at St. John are not normal, about thirty to thirty-five million feet being now piled up. This is not excessive, and if any call comes for it, the price will certainly go higher. Large quantities of deals are moving to the States, and large government orders are daily coming on the market. If England should call for any deals whatever there is no telling where the pine will go, as there certainly will not be any surplus to sell.

Spruce boards are still good for $25 at the mills and scarce at that. Pine stocks are extra light at this season, and will no doubt continue to be so, as only a limited cut of pine was made this year.

Local business at the factories is still pretty good, and it is hoped it will continue so for the fall at least. Some mills at St. John expect to cease sawing within the next few weeks, having sawn out all their logs.

Men are still scarce for the woods, wages being $45 per month or thereabouts. Some operators who usually cut logs are not going into the woods at all this season, on account of uncertain conditions. The cut of logs will, no doubt, be below normal unless plenty of help is provided. The short lumber, such as laths and shingles, continue to be slow in advancing. To-day a certain weakness has occurred in laths and high-grade shingles, while low-grade shingles are very firm.

Ottawa Shell Box Employees Now Out of Work

Ottawa, Sept. 21.—(Special to the Canada Lumberman.)—The Ottawa lumber market during the closing weeks of September showed a more decided tendency toward quietness than was noticeable in August and early September, and was considerably quieter than for the corresponding period in 1916. Little trading went on, and both American and Canadian enquiries fell off. Stocks of dry lumber, while they continued sufficient to meet demands, were not large, and the market was not overstocked.

Price advances are reported in a number of cases. Good pine sidings 1 x 7 in. advanced considerably, reaching $75 per thousand feet. All grades of good pine sidings are higher; also 1 in. good pine strips. The red pine quality showed a general advance. Quotations on spruce remained stationary. The reason given by manufacturers for the advances in good quality pine is that the lower grades have been steadily advancing in price while the uppers have practically remained stationary for some time. The local market is not heavily stocked with 1 x 7 in good pine sidings.

With the mills and woodworking plants the situation is rapidly changing, due to the stopping of shell box manufacture, and staffs are being reduced. Contracts for shell boxes have not only been stopped and are not procurable by local plants, but some contracts are being cancelled. One instance is cited in the trade in which a party who had a big shell box contract and had purchased over 30,000 feet of lumber to fill it is not now in a position to do so. A department of the government has asked a local manufacturer if he can take the stocks off the contractor's hands.

Between 150 and 200 employees in woodworking plants at Ottawa will be affected by the curtailment of the shell box industry. Some of the shell box workers were let out around September 15 and others during the period September 17 to 22. The exact number is hard to approximate. By the end of September work on the old contracts had practically ceased with the local plants.

The spruce situation is still a matter of speculation with the lumber trade. Some dealers believe that the price is bound to decline following the stopping of shell box orders. Others believe the high prics prevailing in the pulpwood market will keep spruce at its present levels.

Mr. C. Jackson Booth says that 1917 has been the worst season in many years from the mill end. He hopes that the cessation of the manufacture of munitions will ease the mill labor situation. During the past two weeks the Booth sawmill at the Chaudiere has operated up to only 75 per cent. of its day working capacity. This has necessitated a few men being laid off in the sawmill. The reduction of the mill cut was made on account of the scarcity of pilers to handle the sawn lumber in the yards. Pilers, Mr. Booth states, are of a roving class, but he has hopes of securing sufficient labor of this kind to allow his sawmill to operate to capacity to the end of October. Logs from the Upper Ottawa are coming down well. The level of the Ottawa River fell considerably during the week of September 15 to 22. Unless a wet period sets in before the end of the month or early in October there may not be sufficient water-power available to keep the sawmills at the Chaudiere open as late as expected. The Booth interests are only sending a few small and scattered shipments to European markets. "The lots are so small that they make practically no difference to us," says Mr. Booth regarding these shipments.

The W. C. Edwards Company, one of the principal shell box manufacturing firms at Ottawa, told the representative of the Canada Lumberman that it had not been able to secure new contracts for shell boxes. This plant, during the latter part of September, was working on old shell box contracts, which it is expected will be filled early in October. If new contracts for boxes are not secured, about 60 hands will be let out. The lumber situation with the Edwards plant has

shown little change during the past two weeks. On the whole, the operations of the mill this year have been satisfactory.

The labor situation with the Hawkesbury Lumber Company has shown some improvement since the last report, and it is expected that the sawmill will work to the end of October or into early November. Regarding the camp and woods operations of this company there is nothing new to report. Gilmour & Co., wholesale lumber dealers, report a satisfactory trade for the summer months, and the outlook for fall and winter operations is reported to be as good as could be expected. "We can sell all the lumber we have at a good figure," was the report from this office. Gilmour & Co. did not care to express a definite opinion as to whether or not the price of spruce would decline following the cessation of shell box manufacture. "There is not a great deal of spruce on the market, and I am inclined to think that the price will keep up, if it does not advance, both in Canada and the United States," said Mr. Gilmour.

Last week the estate of James Davidson completed its last order for 4.5 shell boxes, having supplied the 10,000 boxes contracted for. When this order was finished, between 30 and 40 hands were let out. All of the men working on the 4.5 box did not go, some being kept over to work on the Bethlehem order box. This contract, the last that the Davidson Estate has, was finished during the last week of September, and upwards of 40 or 50 more hands were let go. Work on the new bush camps that this firm is establishing is proceeding satisfactorily. Cutting operations in the woods have already began.

The McAuliffe-Davis Lumber Company completed its last shell box contract on September 19. Between 20 and 25 men were let out. During the preceding week, as the work slackened, other employees had been let out. About 75 men in this plant were affected by the stopping of shell box orders.

Nova Scotia Building Many Schooners

Parrsboro, N.S., Sept. 21.—(Special to the Canada Lumberman.)—The schooner Laura C. Hall, of Parrsboro, has been purchased by the Anglo-Colombian Development Company, Ltd., of London, Eng. This vessel was built at Parrsboro nineteen years ago, and registers 100 tons. The purchase price is said to $5,500, which nearly covers the cost of building, but, of course, prices were very much lower nineteen years ago than they are now. The latest owner bought the vessel two years ago for $1,800, and has sailed her successfully two seasons, so it is evident that she did not owe him anything after he made the present sale. The schooner sails to-night for New Haven, Conn., where she will have an engine installed and will load a general cargo for Panama. On arriving at that port she will be employed along the coast of Colombia. Her crew are all Parrsboro men, five in all, and three of them—the master, mate, and cook—hold masters' certificates, which seems to indicate that masters are now more plentiful than vessels.

The twin schooner Minas Queen, which was launched at this port last December, was torpedoed and sunk last month while on the voyage from France to New York. All the crew perished except the boatswain. The master and mate were from the Parrsboro shore, the master from Advocate Harbor and the mate from Parrsboro town. The schooner was sold last spring to Newfoundland parties and was returning to New York in ballast, after delivering a cargo of oil at a town in France. She was a remarkably fine vessel of 456 tons register, and was said to be the best vessel of her class ever built in Canada, as her planking was practically all of pitch pine. A schooner of the same size, built from the same model, will be launched from the same yard the first of October, but, like all the vessels built on this shore this season, she was sold before she was half-finished. She will be succeeded by a four-masted schooner of about 800 tons register and a carrying capacity of about 1,500 tons, which will be commenced immediately and launched early next spring.

It is probable that very little lumbering will be done in this region next winter, except in the way of getting out ship frames and planking and, possibly, some special lines of lumber for the United States trade. The lumber dealers have more lumber on hand than will be required for the trans-Atlantic trade, even if the embargo should be raised, and about all the men to be had will be wanted to get out ship timber.

U. S. Hardwood Markets Strong

The Hardwood Manufacturers' Association of the United States, in their market letter under date of Sept. 22, say:

As time goes on the fact becomes more and more apparent that government buying of lumber is going to dominate the market for some time to come, reducing the output for private and commercial interests proportionately, so that any danger of overproduction is far away. While there is a slowing down of demand for some items, and an occasional concession, all hardwoods, without regard to kind and grade, are good property, and there is no occasion whatever for throwing them on the market at a sacrifice. The general situation is very strong.

The improvement in the car supply has continued, and many mills are getting all the cars they need. We believe, however, that the movement of troops and crops this fall will more than offset the increased efficiency that has been gained. As a matter of fact, the improvement in the car supply has induced some shortsighted producers to place cars of hardwood lumber in transit. This is a practice that can only serve to demoralize conditions.

There is a heavy demand for such hardwoods as are used in the manufacture of army wagon transports and motor trucks. The lower grades of all kinds of lumber are in strong demand, and there never before has been such a market for the product of box factories. Sash and door and furniture trades are not particularly active.

The general opinion seems to be that we will have a heavy fall trade, and that prices will be maintained.

Oak.—One inch F. A. S. and No. 1 common plain and quartered oak are not particularly active, due largely to the slump in building operations. Business with interior finish mills, flooring plants, and high-grade yard trade is decidedly off. The extraordinary demands of the government, however, continue to tax the ability of the mills, and there seems no possibility of an accumulation of stocks. Low-grade oak continues active.

Poplar.—Everything in poplar continues strong, with light stocks on hand. Poplar prices are strong, and will likely continue so as long as the log supply remains short. Production continues below the deman. No. 2 and No. 3 common are in strong demand for the box trade.

Chestnut.—No. 1 common and better chestnut is in better demand than thirty days ago. Sound wormy and No. 3 common rule strong in price and small stocks at the mills.

Basswood.—Basswood continues in very heavy demand, and mills are practically sold up in the wood, green and dry.

Ash.—The ask market is in a class by itself. There is no one who really knows what the price of ash is, and in getting prices they vary from $5 to $25 per thousand, according to what the stock is going to be used for and how big a hurry they are in for it.

New York Markets Firmer

Simpson, Clapp & Co., New York, in their monthly market letter say: With the fall season well advancing and recent vessel arrivals not above normal, we are pleased to report the market more steady. While there has been no increase in building operations in the city, government work on a more or less extensive scale in suburban sections has commanded good-sized orders from local yards. This applies especially to boards, with the result that to-day there is a good demand for them, particularly spruce. There has been a better enquiry for spruce lath, with the result that prices have improved.

Dunlop Advertising Manager Back from the East

Mr. A. A. Briggs, the advertising manager of the Dunlop Tire and Rubber Goods Company, has returned to the head office at Toronto, after a lengthy tour in the interests of the company. Last year Mr. Briggs covered the Western territory, going as far north as Alaska. This year he covered the Eastern provinces of Canada to Sydney, C.B.

On these trips Mr. Briggs makes a thorough enquiry into the advertising conditions affecting the tire and rubber market, locally and generally. He is usually in touch with the automobile clubs; makes it a point to meet all the important garage men and automobile dealers in every city he visits, and wherever possible he travels in an automobile, so as to become thoroughly acquainted with the road conditions with which Dunlop tires have to contend. Mr. Briggs reports that in Quebec the road from Montreal to Quebec and the King Edward Highway, from Montreal to Rouse's Point, are unexcelled on the continent, and possibly only equalled by the Vancouver Island Highway. On the other hand, some of the roads in the East "would give an army tank a good wrestle," as Mr. Briggs graphically expresses it. During his travels Mr. Briggs was frequently interviewed, and the material appearing has been valuable publicity for the Dunlop Company. Mr. Briggs is the only advertising man who undertakes an extensive trip in the interests of his company and makes a study of the conditions that influence and control trade, as well as enquiring into the best available local means of advertising.

The latest converts to the general advertising of lumber are the members of the Western Pine Manufacturers' Association, who decided at a recent meeting to levy an assessment of 5 cents per thousand feet upon their output for the advertising of Western white pine during the next three years. The lumber will carry an association trade mark as a guarantee of quality, and the advertising will call attention to the fact that the use of a trade mark puts both the individual manufacurer and the association behind the goods. Western white pine is a widely distributed species of many admirable qualities, and the public will learn that there are several hundred billion feet of standing timber in this territory, so that the user of the wood need have no fear for future supply.

Teas for the Camp

The question of tea is getting to be an interesting one, for with the advancing prices it is now very difficult to procure a quality of tea which will suit the men, and at the same time at a moderate cost. In this connection we have to advise you that we are fortunate in having a quantity of low priced kinds on hand, and have evolved therefrom a blend of Mixed Tea, which is a splendid drinker, having a full body along with a measure of flavour. We are able to let you have this extra value, packed in hundred pound chests, at twenty-one cents.

Trade Solicitors Trouble Makers

Retail Lumbermen Who Employ Them Encourage a Dangerous Business Parasite

One of the subjects least often discussed at lumber conventions came in for vigorous handling by Mr. W. R. Hudson, of Detroit, at the recent meeting of the National Retail Lumber Dealers' Association, at Chicago. Mr. Hudson had been asked to prepare an address on the question "Do Retail Lumber Dealers Need Solicitors to Secure Business for Them?" After a general introduction, Mr. Hudson said:

The topic assigned me was placed in the form of a question. Why there should be anything to suggest or even intimate that the subject is debatable I cannot conceive, for it is the great, ugly seed we have all at some time sown, and, even when sown by one of us, we have all suffered to reap a ruinous crop of disunity, disloyalty, disorganization, hatred and malice.

Solicitation is a pernicious practice; its destroys wantonly and viciously, without profit or increased volume of business, and not only business, but the very character of man; for it promptly draws all men of the business in question down through the channels of distrust and enmity to a level of weakened minds and loss of character, and saps life of its happiness, resulting in doing business for the hatred and not the enjoyment of it, and creating destructive and not instructive and beneficial business. You lower your standing in the community, for your distrust steals away good judgment; you become slave, and not master, of the business you would wish to develop and which is degenerating you. Such disruption leads straight into your social and home life.

It is remarkable the survival of business where solicitation is practised. It has only been through good judgment and sound sense of some of the lumbermen who on such occasions have stemmed the tide of such foolish and light-witted practices, and have brought business back to normal.

A solicitor's practice is virtually to arouse, excite, tempt, allure, or entice by some tangible qualities, with such sense of demeanor as to attempt to force an entrance into the pleasant and satisfactory business relations of a customer with a competitor. It is not the questionable or undesirable customer, but the cream of the trade, the asset customers, he solicits. His biggest asset is to carry or make gossip, his noblest truths are falsehoods, his only chance to get business is to cut the heart out of price. His slogan is: "My business is to get business," and he loses sight of his concern's interests entirely.

Those of you who send out solicitors know that you do not employ high-priced, highly-intelligent men, keenly trained in the ethics of business. You insure cashiers and other high officials of your organization, taking no chance of loss, but you dump the very vitals of your business, with no protection, into the hands of a free lance, letting him play the game as he chooses, sowing inadvertently distrust, contempt, false representation, inferior grades, and sometimes bankruptcy—all of this with the idea of getting business under emulous competition.

The world is changing; life habits are changing; business is changing; governments are changing. We are looking now into the early dawn of a new era, and as the light begins to throw its peerless rays it is warming men's hearts and tempering heart, soul, and mind to the necessity of co-operation.

Reaping the Whirlwind

Ah! What do you reap from solicitation? Ill-will and unfriendliness with the very men with whom your interests are in common; destruction of co-operation; disrupted prices and with no terms; loss of customers that are your assets; gain of riff-raff trade; no profits; distrust and dissatisfaction with mankind and particularly yourself; worry that reaches into your home and upsets domestic tranquility; the possibility for worthless characters to establish themselves in the contracting business, ruinous to the legitimate trade which is your real assets, and hazardous to the home-building public; filling the courts with liens.

You personally become correlative to and an accomplice of dishonest knaves and shyster contractors and builders. Now, when you go after a particular customer of a competitor of yours, do you, or does your solicitor, say to him: "I am giving you a price or quotation upon which I am losing money, but after a while, when you become a good and settled customer, I will make up this loss, for you will, of course, have to pay as much as the other dealers have been charging you in order that I can make a living." And then you add: "Mr. Customer, there is only one possible way that you can ever expect to get better prices legitimately, and that is when, through co-operative economic channels, the dealers will be able to reduce cost."

And when your solicitor lands a competitor's customer at destructive prices will you immediately send out a notice to the trade that is your asset, saying: "We have cut the price to get Mr. Smith away from the Jones Lumber Company. We recognize this, of course, as discriminating, as it places Mr. Smith, through us, at the advantage over you: therefore, you can have the same prices as we have quoted him"?

No! No! You will not do that. The sickly idiosyncrasies of business that practises solicitation become susceptible to the cunning trade. Your mentality is lowered to the belief that your fellow-lumbermen are rotten at the core, and what your undesirable trade has left untold your decrepit imagination has filled in.

Your trade has left you. Those that I have referred to as your assets are big enough to buy their lumber wholesale, and they have developed into a lumber-dealing contracting concern. Those who cannot do that strive one, using you as the lumber-yard-draying part of their own business.

In the turmoil of it all you have saddled the trade to ride at will on terms, accommodations, and prices ruinous to them and yourself.

Does a standard product like lumber need to be peddled? Do solicitors stimulate a demand for one foot more lumber in the aggregate? No!

The solicitor is a parasite; his salary an economic waste; he is non-productive; he cannot produce a single useful thing.

When the customer, on the other hand, goes to one or more of the yards of his own choosing and comes in contact with the firm's organization which has expended its energy to promote efficiency and not destructiveness and which economizes by letting the trade come to it, then he can get better prices and better lumber, and the trade is benefited rather than disrupted.

Service, quality, and price are in a general degree standardized and the cost of doing business is minimized. Your trade is firm, and your assurance of reasonable profits is equal to that of a banking business. You have attained the equal proportions of the solid business.

Strike from your vocabulary the word competition and replace it with the slogan "co-operation," and you have automatically dealt the death-blow to solicitation and are facing in the right direction to sow successfully the seed of unity and association. You will supplant the methods of soliciting with methods of educating the trade.

Aesthetics of Co-operation

Associated, you can place exhibits in your community that will educate all the trade as to the best lumber and the most practical grade to use for certain purposes. The artcraft of doors, interior finish, as well as that of style and character of the exterior of the home, the durability of one class of lumber, timber, etc., over others, shall enter into the associate salesmanship.

The owner can take the plans from the builder or architect, go to the association exhibit and realize the detail work of the home prior to its completion. This method of salesmanship enables the owner of the home-to-be to put into it his and her character and personality, for that is what every home-owner has wished to do and has been unable to do further than their imagination would carry them in plans and specifications written and drawn out by an architect.

And how closely are the architects and lumber dealers co-operating Pitiful to behold isn't it We should trust ourselves to the architects, and make them feel our weight and how impossible it is to do without us. We both have a high calling in our separate but relative lines; for the one is the creative and the other the productive contributor to man's most sacred place on earth—his home.

Lumbermen cannot live by themselves alone; they are dependent upon every other unit of business. We are here to apply the lubricating oil to the ever-moving wheels of progress, and not to apply the brakes. We must advance or go backward; we cannot stand still. We must grow, think, and apply ourselves, and with this timely national organization we can at least endeavor to solve such problems as are necessary to advance our business to the highest point of efficiency. Those who will not see, those who do not enlist in this economic cause, necessarily must drop by the wayside—not because of organized competition, but because they tried to reap and not to sow; because they continued to apply the brakes of wornout and ever-failing practices so ruinous to the business, and the man, and the community. Co-operation to perfect and unite efficient business is the uninterrupted current drawing us toward success.

Canadian Lumbermen's Association Meeting

The Canadian Lumbermen's Association, the Canadian Forestry Association, and the Canadian Forest Protective Association will hold their annual meetings in Montreal during the first week in February, 1918. It is expected that the three associations will conclude their meetings with a joint banquet.

Shipwrights, joiners, and laborers to the number of about 1,500 recently went on strike at Seattle, Wash., tying up a number of wooden shipbuilding plants. The strike was called as a part of the effort on the part of the organized labor to enforce an eight-hour day in lumber and shingle mills.

Personal and Miscellaneous

The Forest Mills of British Columbia, Ltd., Revelstoke, B.C., will take out 25,000,000 feet this season.

Mr. R. McDonagh, of Hart & McDonagh, Toronto, left on September 22 on a buying trip to the South for the Canadian Aeroplanes, Limited.

Mr. Gerard Power, of the River Ouelle Pulp and Lumber Company, St. Pacome, P.Q., recently paid a visit of a few days to Toronto and Hamilton, and was a welcome visitor at several lumber offices.

A report from Ottawa states that many plants which formerly were engaged in the production of 8 in. and 9.2 in. shells for the British Government will be converted into plants suitable for producing 6 in. shells.

The Vancouver Creosoting Company has obtained fresh shipments of creosote from Nova Scotia and is now busy treating piles for the C.P.R. pier at New Westminster. The company report that they have several other large orders on hand.

About nine million acres out of a total of two hundred and ten million acres in Quebec Province are under agricultural development. The chief crop of the remaining two hundred million acres is, and will always be, timber, for the reason that the soil is unfitted for tillage.

Jackson & Tindle, Buffalo, N.Y., announce that on September 29 they moved into new offices in the Niagara Life Building, corner Mohawk and Franklin Streets, where they now occupy rooms 502-505. The offices of the Superior Lumber and Cedar Company, Inc., and the New Ontario Colonization Company, Ltd., have also been moved to the new quarters.

Liverpool and Manchester Stocks

Tell the Purchaser How Much It Will Cost

"Buy a nice hardwood floor for your kitchen—$6.76, nails and all included."

This idea, suggested by H. R. Isherwood, of the retailers' service department of the National Lumber Manufacturers' Association, when carried into effect by retailers is proving a decided success.

"When the average prospective purchaser walks into the office of a lumberman of the old school, asks the price of maple flooring and is told $40 or $60, he knows as much as he did before. He goes away with a feeling that his hardwood floor is going to cost a lot of money and perhaps he had better not get it. He doesn't know that the price given him was for a thousand feet, said Mr. Isherwood.

"On the other hand, the lumber dealer of the new school sells flooring by the hundred feet, or better still, by the floor. Thus the average kitchen is ten by twelve, and would require 160 feet. This at $40 a thousand would be $6.40, leaving thirty-six cents for nails."

Just One of the Many Types of JEFFREY CHAINS

for Conveyers for the Economical handling of Logs, Lumber, Refuse, Chips, Pulpwood, etc.

Jeffrey Chains are a recognized standard in Lumber and Woodworking industries.

They are built especially to meet the demands of Elevating, Conveying and Power Transmission Service—and they do it.

Let us help you to decide as to the type best fitted to your requirements. Our latest Chain Catalog and Price-List No. 211-6 should be in your possession. Send for your copy.

Pulpwood Rossing Waste

Can you give me information in regard to the difference between rossing pulpwood in Green Bay Barkers and barking drums in which they are tumbled? How many men will be necessary for a camp to take out 15,000 cords of spruce wood for paper pulp?—R. G. McConnell.

The difference between rossing pulpwood in the Green Bay Barkers and tumbling it through the drums, according to advice which we have from those who are engaged in the production of pulp, is practically nil, provided that the bark from the barkers can be used as fuel. The drums are used only for wood that is taken from the water, and the bark it removes is emptied back into the water. With the barkers there is 15 per cent. more waste than with the drums, but the bark, being dry, can be used as fuel. One large company in Eastern Canada fires a 500 h.p. boiler with its barker refuse. If coal were used for this boiler the quantity consumed every day would be 20 tons, which at $6.50 per ton would amount to $130 per day. The four Green Bay barkers in use treat on an average 100 cords of pulpwood per day, and of this quantity 15 cords more are wasted with the barkers than with the drums. At $8 a cord this amounts to $120. It will be seen, therefore, that when the bark is used as fuel there is very little difference between the use of the barker and of the drum.

The number of men required in a camp to take out 15,000 cords of spruce pulpwood will depend somewhat upon local conditions. Two good men should average at least 2½ cords per day, but a safe estimate is one cord per day for each man in camp, including cook and helpers. With this as a basis it should be possible to estimate the cost and time required for taking out 15,000 cords, according to local conditions and the facilities available.

Watch the Braze

The braze is the weakest part of a band saw, and as such should be subjected to constant and close inspection. The reason why it is the weakest part of the saw is because the braze itself and about one inch each side of it is bound to be milder in temper than the rest of the saw—a quite common opinion among filers, to the contrary notwithstanding.

It would seem that a slight consideration on the part of those who contend that a braze can be fully tempered would suffice to dispel the impression, but it seems to persist As the temperature necessary to prepare the braze for a high temper would melt the solder, it is obvious that only a comparatively mild temper can be secured.

The original temper of the saw is drawn by the hot irons in brazing. After this all that can be done is to finish the braze and then stiffen it, but it is impossible to secure the original high temper.

As the material right at the braze is milder than the rest of the saw, it naturally follows that the braze will pull tension quicker than any other part. It is also liable to bends when changing saws on the wheels or handling them in the filing room; therefore the braze should be carefully examined after every run. If necessary, it should be levelled and tensioned before placing on the wheels again, otherwise a crack in the braze will quickly result. When this occurrs the braze should be immediately re-made, as there is always much more danger attending a crack of this kind than one in the body of the saw.

Some filers follow the practice of punching a crack in the braze just as in any other part of the saw. While this sometimes proves successful, it is not good practice, because it usually does not overcome the trouble and subjects the saw to great risk of further breakage at the braze, besides placing the operators in danger of serious injury.

Breakage at the braze will be practically eliminated if rigid inspection is made after each run and any indication of weakness or tension pulling corrected before it has a chance to develop.—Disston Crucible.

Better Buildings in French War Area

If present plans are carried out, the invaded parts of France will be rebuilt on a larger and finer scale than before they were levelled to the ground by the German armies. Narrow streets in cities and towns will be widened. The little one and two-storey dwelling will be enlarged and beautified. Unsanitary conditions will be eliminated and other conditions measurably improved. In all probability these sections of France will afford a market for quantities of lumber from Canada and the United States and other building materials, due in part to the ravages of war on both French man-power and materials of all kinds.

Pennsylvania Retailers' Directory

The Retail Lumber Dealers' Association of Pennsylvania have published a very complete directory of dealers throughout the state. The list is thoroughly up to date and is being revised and published every three months by the association. In addition to the list of dealers, it contains a large amount of useful advertising. The address of the association is 730 Park Building, Pittsburgh, Pa.

Lumbermen's and Railroaders' Clothing

Guaranteed Pure Wool Mackinaw Coats, Pants, Shirts, Mitts Socks, Underwear, Etc., of the Highest Grades.

EDGINGS

Ontario

The Fleming Tie and Lumber Company, Ottawa, Ont., have obtained a charter.

Dafoe & Waller, sash and door manufacturers, Napanee, Ont., have sold out to W. D. Widmer.

The Dominion Department of Indian Affairs held an auction sale recently at Toronto, when the timber on Hope and Beckwith Islands, in the Georgian Bay, was sold to Mr. Joseph Oliver, of Toronto, for $114.500.

The International Lumber Company, a corporation created under the laws of the State of Minnesota, has been granted a provincial licence to carry on business in the Province of Ontario and to manufacture lumber, lath, shingles, etc. The Keewatin Lumber Company, Ltd., Keewatin, Ont., has been appointed attorney for the International Lumber Company.

Lauder, Spears & Howland, Toronto, have completed the erection of their sawmill at Lost Channel, about 10½ miles from Pakesley, a station on the C.P.R. The mill will operate upon logs taken out in the Pickerel River district. The capacity of the mill is about 50,000 feet per day. The company have also completed, in co-operation with the Schroeder Mills and Timber Company, the construction of the railroad from the mill into Pakesley, and will ship their lumber out to the C.P.R. over this road.

It is expected that the new plant of the Mattagami Pulp and Paper Company at Smooth Rock Falls, Ont., will be running this month. Two of the digesters are already in position, and the third will be added in the near future. The slasher mill is in operation and is turning out 2,500 cords daily, and by the end of the month there will be a pile of 35,000 cords on hand, which will keep the mill in operation for the coming season. The company recently completed new brick offices, and the work of laying out the model town site is going ahead rapidly. Housing accommodations will be finished this fall for 125 families.

A logging railroad, to be known as the "Key Valley Railway," has been constructed by the Schroeder Mills and Timber Company. Milwaukee, Wis., and the firm of Lauder, Spears & Howland, Toronto, to operate between Pakesley River. The railroad is 10½ miles long, standard gauge, with 50-pound rails. Station on the C.P.R., and Lost Channel, on Kawigamog Lake, on the Pickerel The Schroeder Comany and Lauder, Spears & Howland will use the road for transportation of men and supplies, and Lauder Spears & Howland will also use it for delivering to the C.P.R., at Pakesley, the cut of their new mill, which is located at the western end of Lost Channel.

Eastern Canada

The Pulpwood Supply Company, Montreal, P.Q., has been registered. I. Raymond is interested.

A despatch from St. John, N.B., states that the Fraser Companies, Ltd., have purchased 280.000 acres of timber land in Nova Scotia from the Halifax Lumber Company.

La Compagnie des Forestiers de Peribonka has been formed, with a capital of $15,000, to cut and manufacture lumber, carry on a general lumber business, to deal in forests, land, waterways, mills, and storages and to carry on the floating of logs, etc. The incorporators include Messrs. A. Simard, forestry contractor; J. Saulnier forestry contractor and E. Simard lumber culler, of Quebec. The principal place of business is La Malbaie P.Q.

The capital of La Compagnie Couture, Rheault, Ltd., is $99,000. The main objects of the company are to carry on a lumbering business and the trade of lumber, paper, and pulpwood, including manufacturing. Also to acquire or construct power plants in the districts of Rimouski, Gaspe, Chicoutimi, and Saguenay. Messrs. H. Couture, lumber merchant, of Mont Joli; C. Champoux, lumber merchant, Restigouche, P.Q., and D. C. & A. Champoux, lumber merchants, Campbellton, N.B., are interested. The head office is at Mont Joli, County of Matane, P.Q.

The Riordon Pulp and Paper Company, who have acquired a site near Temiskaming, on the Upper Ottawa, for the building of a large sulphite mill and paper plant, are developing a model town adjacent to the mill site for the accommodation of the employees of the company and others. Houses will be built from designs prepared by leading architcts. Areas are being set aside for open spaces, social centres, churches, schools, etc., in advance. The main approach will be by a street eighty feet wide, passing through a square, on which the stores and public buildings will be erected. It is proposed to make the town a model of its kind, as it is realized by the company that agreeable housing and favorable social conditions are of vital importance in increasing the efficiency of the workers.

Western Canada

The Empire Lumber Company, Ltd., have opened a branch at Prussia, Sask.

The Qualicum Saw Mill Company, Ltd., has been incorporated, with capital

stock of $25,000 and head office at Vancouver, B.C. to carry on business as loggers, timber, and lumber merchants sawmill and shingle mill proprietors, etc.

The Thurston-Flavelle Lumber Company, Ltd., Port Moody, B.C., have obtained a charter.

Plaxin & Veregin, lumber dealers, Buchanan, Sask., have been succeeded by Plaxin Brothers.

The Leitch McLean Lumber Company, Ltd., have moved from Saskatoon, Sask., to Winnipeg, Man.

The Inlet Timber Company, Ltd., has been incorporated, with head office at Vancouver B.C., and capital stock of $35,000, to carry on business as loggers, timber merchants, sawmill proprietors, and general lumbermen.

The Hanbury lumber mill on False Creek, Vancouver, B.C., sustained considerable damage by fire recently. The fire started shortly after midnight in one of the dry kilns.

Between 2,500 and 3,000 cords of bolts were destroyed by a bush fire near the shingle cutters' camp of the Robert McNair Lumber Company on the Coquitlam River, B.C., recently.

Roray & Yeaman timber factors, Vancouver, B.C., have closed a sale of five sections of spruce timber on Queen Charlotte's Island to George Johnston, trustee, of the T. A. Kelley Logging and Lumber Company, Ltd., Vancouver, which concern will log the timber and tow it to mills in that city and vicinity.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 15th day of October, 1917, for the purchase of License X1076 to cut 1,024,000 feet of fir, cedar, and hemlock and 5,120 lineal feet of poles on an area adjoining S. T. L. 1484P, Ramsay Arm, Range 1, Coast District. Two years will be allowed for the removal of the timber.

Cedars, Ltd., are establishing a logging camp and a lumber and shingle mill combined on Lynn Creek, north of North Vancouver, B.C., and have purchased limits totaling 2,000 acres. The timber is estimated to contain 100,000,000 feet of cedar and 80,000,000 feet of hemlock and larch. The sale was made by Roray & Yeaman, timber factors of Vancouver.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 11th day of October, 1917, for the purchase of License X1068 to cut 1,307,200 feet of spruce, cedar, and hemlock from an area situated in Atli Inlet, Lyell Island, Queen Charlotte Islands District. Three years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 11th day of October, 1917, for the purchase of License X1067 to cut 2,226,000 feet of spruce, cedar, and hemlock on an area situated on Richardson Inlet, Lyell Island, Queen Charlotte Islands District. Three years will be allowed for the removal of the timber.

The Northern Mills and Timber Company has been incorporated, with head office at Vancouver, B.C., and capital stock of $20,000, to carry on business as builders and operators of sawmills. shingle mills, and planing mills, and to manufacture and deal in rough and dressed lumber, shingles, mouldings, and finishing lumber of all kinds.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 11th day of October, 1917, for the purchase of License X1069 to cut 1,499,300 feet of spruce, cedar, and hemlock from an area situated in Atli Inlet, Lyell Island, Queen Charlotte Islands District. Three years will be allowed for the removal of the timber.

The Whalen Pulp and Paper Company, which is establishing a large industrial plant on Vancouver Island at the new town of Port Alice, near the head of the southeast arm of Quatsino Sound, has decided to make itself as independent as possible of the transportation companies by building its own vessels. The company will lay down two keels at a time, and will continue building ships until it has enough to handle its export trade. The vessels are to be approximately 2,500 tons and of standard type similar to those building in Victora and North Vancouver for the Canada West Navigation Company. It is expected that when the plant is in full operation the company will give employment to 1,000 men.

Lieut. William M. Calder, of Lachute, has been promoted to the rank of Captain and Quartermaster in the Canadian Forestry Service now in France. He joined as a private in April, 1915, and after considerable service in the trenches returned to this country owing to illness. He then joined, as a Lieutenant, the Forestry Battalion raised by Lieut.-Col. J. B. White, with whom he again went overseas.

The Pacific Lumber Inspection Bureau, Inc., Seattle, Wash., have published a 1917 edition of their domestic standard schedule of prices, dimensions. grading rules, etc., of Douglas fir, Western hemlock, Sitka spruce, Western red cedar, and Port Orford cedar lumber. This list is known as their "Domestic Seven" list. They have also issued a new export standard schedule of prices, dimensions, grading rules, etc., of Douglas fir, Western hemlock, and Sitka spruce lumber, which is know as their "Export H" list. These lists include much valuable information for those who are engaged in the domestic and export lumber trades of the Pacific Coast.

A Bond "Spiro"

A Coupling That Is Safe

Once a Spiro is put on in a proper manner it can be forgotten.

There are no keys to break or become loose.

The pull of the bolts on the two halves of the coupling acts on the slotted sleeve in a manner to make it grip the full surface of the shaft with a grip that holds.

The sureness of the Spiro's grip removes any chance of loose coupling dangers, and provides safety to your workmen, as well as uninterrupted supply of power without annoying shutdowns.

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9 ft. wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. BRAZEL PLOWS cut 6 in. wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road, leaving a clean roadbed. Roll up and push entirely away from the road, 12 inches of loose snow each time the plow passes over.

Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue Belts stretch 15% to 25% less than other belts and have just the right amount of "cling" on the pulley.

Write us for particulars and prices

YOU NEED "LITTLE DAVID" FOR WOODEN SHIPBUILDING

— MORE WORK AND LESS WORRY —

The "Little David" Wood Borer is the "Shipbuilders' Wood Boring Machine," because it is light, powerful and speedy, and above all, simple and durable.

It is made in three sizes, the smallest boring holes in wood 1" diameter and under, and the largest, 4" diameter and under.

All sizes are reversible, and the cases are of aluminum with steel bushed cylinders. This explains why the largest size is about ten pounds lighter than any other wood borer of equal capacity.

We have other labor-savers for wooden ship work, such as the CC-101 Drift Bolt Driver, Pneumatic Hammers adapted for trenail driving, and Pneumatic Tools for horsing oakum, etc.

Our nearest branch will be glad to give you full information, and to send bulletins, etc., at any time.

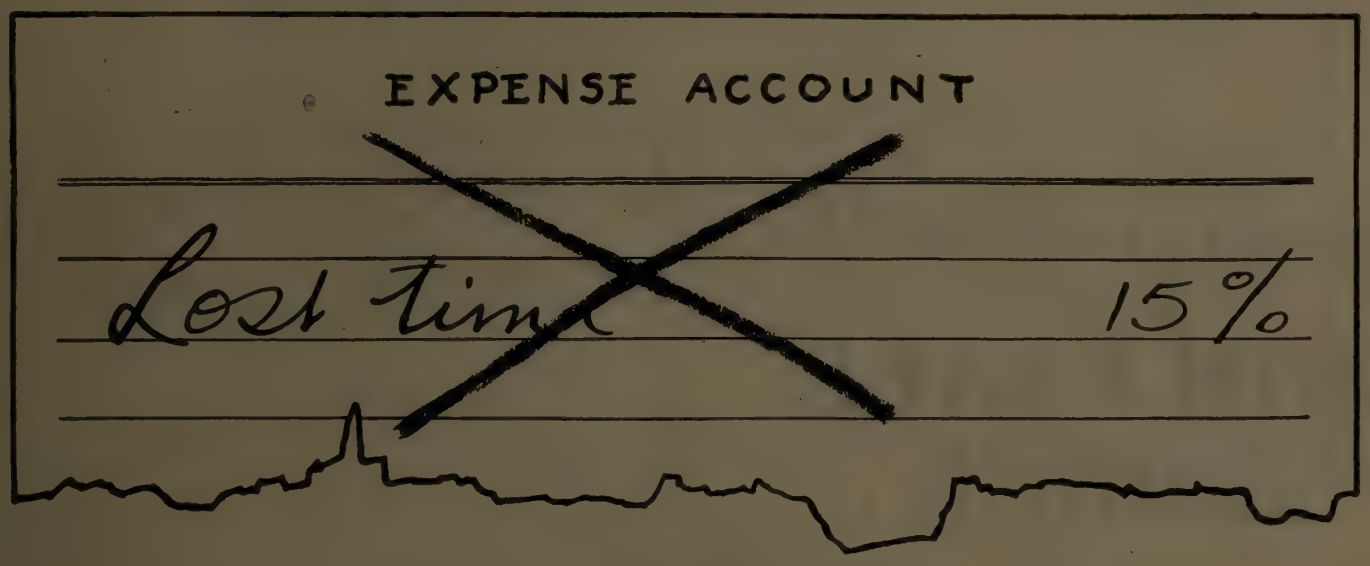
Cross this big item off your expense account



Men, Minutes, Money—Vital to your Success—if they *all* produce *all* they can

The present is no time for lax methods in Canadian industry. You need all possible from your plant, your equipment, and from the TIME of your employees.

You cannot possibly do this without some impartial, automatic, accurate method of measuring and recording time.

Big business today is unanimous in its reliance on International Time Recording machines. No matter what the business—if you have five employees' or five thousand—International Time Recorders will watch your employees time much better and at less cost than the most reliable human labor.

There can be no labor dispute with an International. Each employee records his own time and cannot alter the printed time card in any way. Late comers are recorded conspicuously in red. This simplifies bookkeeping methods.

Write for literature and prices.

Standardized Series

LEATHER BELTING

Tanned by us for belting use

Four Graton & Knight Standardized Belts in Mill of Lincoln Manufacturing Company, Fall River, Mass.
52 in. Heart belt to spinning room · 36 in GraKnight belt to card room
14 in. Heart belt to weave room 29 in. GraKnight belt to basement

Big Belts— For Big Jobs

There is one right way, and only one right way, to buy belting. That is on the basis of the **work to be done.** A big job needs a big belt.

For belting is machinery.

If you buy it as you buy machinery—you will standardize it, as you have standardized your machinery. You will buy Standardized Belting.

Standardized Belts are made to the actual standards of the job. They have been worked out during sixty-six years of belting experience. The requirements of every kind of power transmission have been classified and a Standardized Belt evolved to meet the actual demands of each.

There is Graton & Knight Heart Brand, the standardized extra-heavy oak-tanned centre stock belt — GraKnight, the standardized medium-weight, oak-tanned centre stock belt — GraKnight Dynamo the standardized light-weight oak-tanned centre stock belt—Neptune, the standardized waterproof belting — Spartan, standardized for exacting conditions or difficult drives.

The way to save money on belting isn't to buy cheaper belts—but to buy the belt that will do your work best. You will save money on that belt, and lose money on any other kind.

Apply Standards to your power transmission. Our Engineers and our Belting Laboratory are at your service—let them help you standardize your belting.

Your New Saw Mill

Will give you the best service and the longest service with the least expense for upkeep—If it is a Fisher & Davis Mill.

Catalog of Saw Mills, Edgers, Planers, etc., is yours for the asking. Ask to-day!

FISHER & DAVIS MFG. CO. St. Louis, Mo.

We Manufacture the Following Well Known Brands

"Elkco Special," "Elk Steel," "St. Marys," "Keystone" and "Rotex"

FIRE BRICK

Each brand is specially suited to a separate use. We have the experience to manufacture and supply the finest grade of Fire Brick for the varying uses of the Lumber Industry. The same brick may not meet the requirements of your Dutch Oven and of your Refuse Burner.

This is a product that should have your most careful attention. When so much depends directly on the successful operation and dependability of Fire Brick in your plant, it will repay you many times to make a most careful investigation before the installation. Let us show you where our product has been successfully used for years. Let us suggest a special brand for your particular purpose.

We have an interesting catalogue that will be sent you. It will give you an insight into the proper methods of Fire Brick construction.

Grooves Cut with Huther Bros. Dado Heads

Fits Any Saw Mandrel

A Huther Bros. Dado Head consists of two outside cutters and enough inside cutters to make the required cut. This Head will cut perfect grooves, with or across grain, any width. It is an easy Head to keep in perfect condition, has a simple quick adjustment, and may be enlarged any time after purchase. Sent on approval and if not satisfactory return at our expense.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

MANUFACTURING WOODWORKING

Machine Knives, Circular Cutters and Mortise Chisel

Steam Log Kickers

The illustration shows our Standard Double Deck Steam Log Kicker which we manufacture with cylinders 8 in., 10 in., and 12 in. bore. This kicker is made for either single or double deck mills. The bottom head of the cylinder is cast solid, eliminating the necessity of taking the machine apart for packing. The joint between the valve case and cylinder is a "ground joint," which is perfectly steam tight and requires no packing.

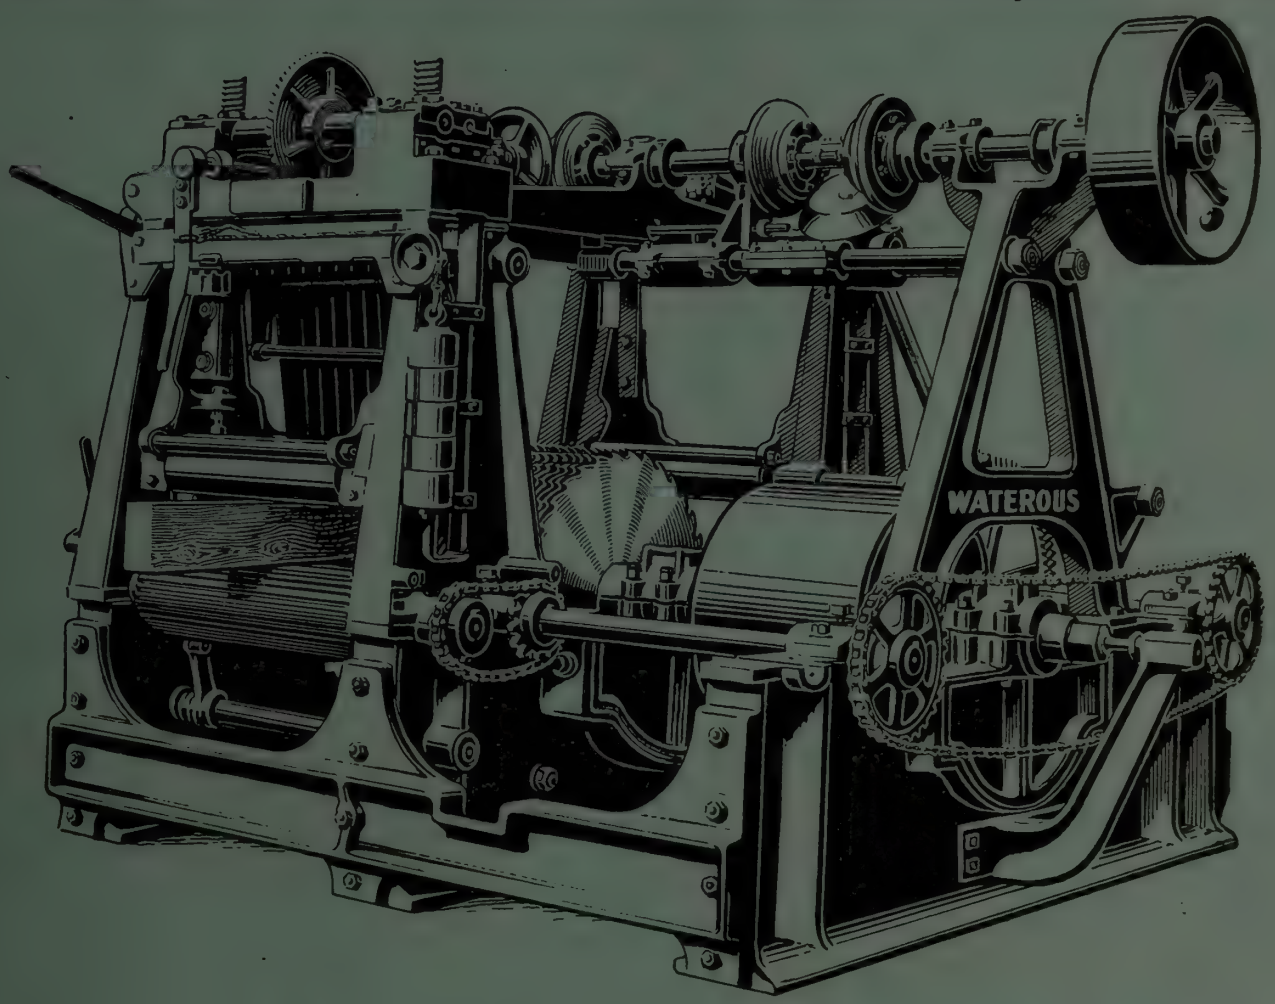
Catalogue on request.

The E. Long Mfg. Co., Ltd.

Orillia, Ont.

This mark on your sawmill machinery is an indication that your lumber manufacturing equipment is the best and most economical money can buy.

The 1917 Model Kendall Circular Gang



A New Machine That IS New

This illustration shows the latest development of the Kendall Circular Gang.

It takes cants from 4 in. to 12 in. thickness at the rate of from 2500 to 3000 a day, will turn them into lumber, perfect in finish and cut evenly from end to end.

Big capacity on small logs, and lumber cut better than is possible on Band Saw, Circular or Vertical Gang, distinguish this machine.

It meets the demand for a machine that will turn small logs into merchantable lumber economically. Those already in use have proven their worth.

While all good points of previous models are retained, such weaknesses that use has made apparent have been eliminated. The new features and better construction of this 1917 Kendall Gang meant an appreciable increase in capacity, in nice cutting ability, and in safety, convenience and sturdiness.

This latest development of the Kendall Gang patents is built in a shop that has specialized in high class machinery construction—that has built machinery for Canadian sawmills for more than fifty years. Our reputation is a guarantee that this New Model Kendall Gang is built as it should be.

When you investigate the Circular Gang question see that you get facts and figures of the "WATEROUS KENDALL GANG"—the New Machine that IS New.

The Waterous Engine Works Co., Limited

BRANTFORD, CANADA

$5,000,000.00

worth of mixed metal sold annually.

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb., Fort William and East; West of Fort William 35c per lb.,** delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c,** delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

HOYT METAL CO., Toronto, Canada

Have factory and office at Eastern Avenue and Lewis Street, Toronto, Canada

Factories also at:— New York, N. Y. London, Eng. St. Louis, Mo.

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

DUNLOP

BELTING HOSE

SEAL OF QUALITY

PACKING

All of our best experience in belt-making is represented in **"Gibraltar Redspecial"**—a friction face belting for Drives, Rotaries, Edgers, Lath and Shingle Machines, or any kind of Transmission work. No service is too exacting; no condition is too abnormal; no load is too heavy for **"Gibraltar."**

Will not dry nor rot, and is practically immune to stretching, as it is made by a process that automatically eliminates this evil. Its endless fund of toughness and great tenacity make Dunlop **"Gibraltar Redspecial"** the ideal belting; more especially when the latter is constantly exposed to the elements.

What Dunlop **"Sunset"** (red) and **"Admiral"** (blue) Packings have done in the way of giving extra service and reducing packing costs for the big steel companies—or, for that matter, countless industries located throughout the Dominion—they can do for you.

For many years Dunlop Packings have been doing continuous duty in some of Canada's largest mills where abnormal conditions call for superb service—where a packing is subjected to the severest kind of tests—where its ability to do the work efficiently is a known factor from the beginning.

Adequate fire protection is secured only through the use of reliable hose—a line like Dunlop which is always ready for use when necessity arises—that will stand the utmost power and give the greatest wear.

These are two of the main characteristics of **"Dunlop"** Double Jacket, and **"Imperial"** Solid Woven Jacket Fire Hose—two brands that are the pride of the largest fire departments in Canada. They, also, possess straight and smooth waterways, and the weight, grade and texture of the cotton jackets are always right.

We are authorized by the Underwriters' Laboratories, Inc., Chicago, to stamp **Dunlop Underwriters' Mill Fire Hose** (Cotton Rubber Lined) with their label of approval.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 37 Toronto, October 15, 1917 No. 20

The Publication of Price Lists

Occasionally the Canada Lumberman receives letters from readers who take exception to the current lumber prices which are published in this journal. These letters, comparatively few, as they are, serve, however, to keep prominently before us the importance of making the published prices as complete and reliable as possible. Sometimes the criticism is made that the prices do not coincide with the reader's ideas. The other chief form of criticism is directed against the policy of publishing prices at all. As to publishing prices, there undoubtedly are two very distinct opinions, though the majority of the readers of the Canada Lumberman unquestionably desire to see prices published. Our wish in this connection is to serve the readers as fully as possible, and the experience of publishing the Canada Lumberman over a long period of years persuades us that the best interests of all sections of the trade are served by the publication of price lists.

The criticism of the actual prices published, however, is quite another matter. It happens occasionally that some manufacturer, wholesaler or retailer, after being unable to obtain the prices quoted in the Canada Lumberman, or to buy lumber at these prices, finds fault with them. Criticisms of this kind we are glad to receive, as they afford an exceptional opportunity for checking up the quotations published. Quite recently a criticism of this nature reached us, and enquiry into the particular prices referred to leads to a belief that sometimes the readers of the Canada Lumberman do not understand as clearly as they should what the prices represent. For this reason some revisions are contemplated in the method of presenting these lists, with a view to making it as plain as possible what the quotations represent. Suggestions from readers of the Canada Lumberman upon this point will be gladly received.

Quoting prices of lumber in the abstract is a difficult matter, but by no means an impracticable one. The aim of anyone who publishes such quotations must be not to give actual prices at which the lumber can be purchased or sold, but rather to present a basis upon which the parties to a deal can reach a reasonable conclusion, after taking into consideration the factors which bear upon their particular case. It is not possible for instance, without seeing a stock of lumber, to say how much it is worth at a given place. There are many elements that will affect the price. The grade of the stock, the percentage of the various widths and lengths, its condition as to dryness, the freight rate to market, etc., must all be considered. For this reason the best that can be done in quoting abstract prices is to give a reasonable range between which the various factors can be balanced off against one another, and such a range must be distinctly understood as relating to a particular point of delivery, so as to eliminate uncertainty regarding freight rates. It is necessary, also, to make such a price list as useful as possible to the whole trade. It has been found by experience in this regard that the most widely understood quotations are those which a wholesaler will make to a retailer, in carload lots. This is the method of quotation most generally in use among lumber trade journals.

In order to furnish a concrete example of the necessity for being as specific as possible, an instance which recently occurred may be recited. An Ontario wholesaler advised the Canada Lumberman a short time ago that the prices quoted in our columns on a certain class of birch were some $8 or $10 too high. Not being content with our own views upon this case, it was submitted to a wholesaler who is probably the most thoroughly posted member of the trade in Canada to-day. Without advising him of the party's name, the facts in the letter were set before him, and his reply, dictated to the Canada Lumberman, was as follows:

"The criticism is made by someone who seems to lose sight of the fact that a large proportion of the manufacturers in Ontario, when quoting f.o.b. Toronto, are computing their prices on a price f.o.b. the mill, plus the freight charges, and are figuring on the basis of the American markets. It is necessary to quote on the American market basis when figuring hardwood prices at Toronto, because the National Hardwood Inspection Rules govern in quite 90 per cent. of the transactions put through. The American quotations are based upon a heavy percentage of long lengths, running from 35 to 50 per cent. of 14 to 16 feet, good widths, well manufactured, and log run for color—that is to say, including all the red in such stock as birch. Bearing this in mind, it will be realized that a price quoted will naturally be the very top price for which Canadian stocks can be sold, with their greater percentage of short lengths.

"It must always be remembered, also, that if a man makes half a dozen different sizes out of a small amount of logs and does not have the lengths required by the market, which is the case with a number of the small manufacturers in Ontario, he must be prepared to take a price just so much lower than that which does meet the requirements of the market. This very fact will account for a difference in price of from $6 to $8. In a good many cases Canadians have the timber to make stock which will compare favorably in grades, lengths, and sizes with the United States market requirements, but they have not made a practice of cutting their logs so as to make the most of them. It would pay the Canadian manufacturers to give far more attention to this point than they do."

It is unfortunate, in this connection, that so much uncertainty prevails in connection with grades of softwoods in Canada and in the United States. The difficulty experienced in quoting prices on softwoods is common to all branches of the trade, and necessitates frequent personal inspection at considerable expense, besides being a fruitful source of disagreement and loss. Several earnest attempts to standardize the grading of softwoods in Canada have been made, but as yet they have been without result. The grades used in the trade to-day are simply a conventional understanding of broad, general subdivisions, and when a transaction is being discussed they have to be supplemented by detailed descriptions of the stock, all of which multiplies greatly the chance of misunderstanding. Those who have stood out against uniform grading of softwoods unfortunately have long-established usage behind them, but the lumber trade has changed greatly in late years, and the growing appreciation of the interests of the consumer may be expected to make the demand for uniform grad-

ing more persistent. Unquestionably the price-quoting problem would be reduced to its simplest terms by a generally recognized system of grading.

The Canada Lumberman wants to serve the lumber trade as efficiently as possible in this matter, and will appreciate suggestions for improving the price lists.

Lumber Prices Always in the Rear

The annual report upon wholesale prices in Canada, published by the Department of Labor for the year 1916, which is now in the press, will shortly appear. The course of wholesale prices in Canada from 1890 to 1916 is shown in diagrams in this report. For a means of comparison the average wholesale prices of all commodities for the year 1890-1899 are placed at 100. In 1890 this average had reached 110. By 1896 it had fallen to about 93, where it continued until the end of 1897. Then an advance commenced, and wholesale prices in Canada have been almost continually increasing from that date onward, with the exception of a slight fall in 1901 and a drop from 126 to 122 in 1908. Since 1908 the average wholesale prices in Canada have been advancing, and in 1916 they reached 182.

With these advances it is interesting to compare the fluctuations in the prices of building materials. A diagram in the report gives building material prices from 1910 to 1916, based upon the average price of 100 during the years 1890 to 1899. In 1910 lumber had reached 160. It advanced gradually through 1910 and 1911, with a drop towards the end of 1911. From 1912 to 1913 the average price of lumber advanced from 165 to 185. With the beginning of 1914 a gradual decline commenced, until in 1915 the price reached 175. Since then it has again advanced, and at the end of 1916 it had reached 185. From the beginning of 1910 to the end of 1916 the advance was only from 160 to 185, whereas the average wholesale prices of all commodities advanced during the same period from 124 to 185.

Miscellaneous building materials commenced the year 1910, at an average price of 105, and fluctuated slightly until the end of 1912. Then an advance commenced which lasted until the middle of 1914, when the price was 115. A slight drop then occurred, and in 1915 and 1916 the price advanced until, at the end of 1916, it reached 182.

The course of average prices for paints and oils shows much more rapid advance than the prices of other building materials. These prices are only available from the beginning of 1912, when the average is placed at 150, as compared with the price of 100 prevailing from 1890 to 1899. Until the end of 1914 the average prices of paints and oils declined, reaching 140 before an upward movement commenced. During 1915 and 1916 the prices have gone rapidly up, and at the end of 1916 they had reached 223.

These statistics illustrate very definitely what lumbermen have been claiming since the commencement of the war, namely, that the prices of lumber have not advanced in anything like the same proportion as the prices of other materials. From the middle of 1914 until the end of 1916 the average prices of lumber showed practically no change. During the same period the average prices of all commodities advanced from 136 to 185. Paints and oils during this priod advanced from 140 to 223,

While the price of lumber was comparatively stationary during these years, the price of practically everything consumed in the production of lumber was advancing steadily, and in many cases rapidly. Take, for instance, the case of food. The average food price at the middle of 1914 was 140. With some rather violent fluctuations, it advanced rapidly, until, at the end of 1916, it had reached 207. Grain and fodder at the middle of 1914 showed an average price of 145. This advanced until it reached 209, early in 1915. In the summer of 1915 the prices of grain and fodder dropped to 160. Then they commenced another advance, and, at the end of 1916, they had reached 238.

Many other interesting comparisons can be drawn from this report, all showing forcibly the way in which lumber has trailed at the rear in the price advance movement. One or two other comparisons are perhaps sufficiently interesting to be made. The average price of steel billets in Canada at the beginning of 1914 was 112. From the beginning of 1915 an advance took place, and by the end of 1916 the price had reached 238. The average price of hides at the middle of 1914 was 210. By the end of 1916 it had reached 418.

These statistics bear out the claim that has been made recently by lumbermen in connection with their advertising, a claim which cannot be too strongly emphasized, namely, that the farmer, or practically any other producer in Canada to-day, can obtain for his product far more lumber than was ever possible before, and that, further, the present is an exceptionally advantageous time for farmers and everyone else to invest their money in building operations.

Is the Freight Car Situation Improving?

It will be rather a pleasant surprise to lumbermen in Canada and the United States this year if it happens that the pessimistic prophesies in regard to a car shortage upon the railroads does not materialize. Of all the years in which car shortages should have developed, according to precedent, this is the one year, because of the entry of the United States into the war, and the vast quantity of war material, to say nothing of large crops and ordinary industrial shipments that have to be carried long distances. Everyone has been expecting a shortage to develop this fall and it is still too early to say whether this expectation will be fulfilled or not, but there are some extremely encouraging signs which lead to a belief that the freight car famine which took place last winter will not be repeated this year. If a car shortage does not occur it will be a striking example of the value of publicity, for the discussion of the subject, both in the press and by business men between one another, must be held accountable for any improvement that has taken place.

During past years the railway companies, by the greatest possible efforts, have never been able to eliminate car shortages when industrial conditions became abnormally active. Apparently they are destined always to fall far behind in their facilities and equipment for handling abnormal transportation problems whenever these problems turn up. The great car famine of last winter, however, not only caused the railroad companies to devote their energies to this difficulty more effectively than ever before but enlisted in their aid the sympathy and effort of every business man. To this fact, more than anything else, will be due such improvement that takes place this year. The assistance given by the shipping public has been chiefly in the direction of loading cars to capacity and unloading with as little delay as possible.

We do not yet wish to go on record as stating that the car shortage has been avoided for the present year, but we do wish to present the facts which point in that direction. In Canada the reports received from many lumbermen in various provinces are encouraging. In the United States statistics available to-day are strongly indicative of a far better situation than anyone thought possible a short time ago. The Railroad War Board of the United States, under the chairmanship of Mr. Fairfax Harrison, operating the railroads of the United States as one railway system, has already obtained results that fall little short of marvellous. During the short time since the board was created it has not been possible to make any appreciable increase in equipment, but, with the patriotic assistance of shippers, the car shortage almost immediately began to show reduction. On May 1 the high point of shortage for the present year was reached, the excess of unfilled car orders on that date amounting to 148,627 cars. By June 1 the shortage had been reduced to 106,649 cars. By July 1 it was only 77,682 cars. On August 1 the shortage was 37,062 cars, and on September 6 it had been still further reduced to 31,591 cars. During a

four months' period, therefore, there has been a reduction in the shortage of no less than 78 per cent.

It is very interesting to examine into the details of operations that have produced this result. For instanec, during the month of June, the revenue ton miles amounted to 32,504,988,201, as compared with 26,379,460,986 for the month of June, 1916. During the four months under consideration the freight locomotive miles increased 10.5 per cent.; loaded freight car miles increased 10.7 per cent. Empty freight car miles increased only 8.7 per cent. All this increased service was performed with an addition of only 1.8 per cent. in the average number of freight locomotives in service and of 3.2 per cent. in the number of freight cars in service. A more definite idea of the part played by the shipping public is secured from the statistics of tons per train. This was increased from 642 tons to 715 tons. In other words, each train carried 73 more tons of freight, or 11.4 per cent. more than previously. The tonnage per loaded car was increased by 2.7 per cent. The improved results extend also to the miles per locomotive per day, the average of which increased 5.6 per cent., while the average mileage per car per day was increased 1.8 per cent. The percentage of empty car miles was reduced by 1 per cent., and the percentage of freight locomotives and freight cars in shop or awaiting shop was also reduced.

Substitutes Strengthening Their Grip

Twenty-five years ago lumber was regarded as almost as much of a necessity as wheat, while to-day it is steadily being replaced by various substitutes, says a report by the United States Forest Service on "The Substitution of Other Materials for Wood." Disregarding the temporary effect of the war, with its sudden demand for lumber and its great enhancement of prices of many substitute materials, the report points out the tendency in the long run. Each year more steel, concrete, brick, or tile is being used in places where lumber was formerly employed. This is particularly true in cities where enactment of building codes and the development of new forms of construction have created a demand for more durable building material. Shingles have given way largely to composition and tile roofings, wooden sidewalks have been almost wholly replaced by cement, while the modern skyscraper, with its steel framework and stone, brick, or tile walls, occupies the site of some former frame structure. Railroad cross-ties and mine props are about the only forms of wood which are not affected.

How hard this substitution has hit the lumber business is shown by the government estimate that the total replacement of lumber in all forms of use is 8,090,000,000 board feet, or 21 per cent. of the lumber consumption of the United States in 1915. The rate of substitution seems to be increasing, and is now in excess of 500,000,000 board feet a year. Approximately 70 per cent. of the lumber cut goes into forms of use whose demands appear to be decreasing. Twenty per cent. more goes into strongly competitive fields. In the remaining 10 per cent. of wood uses there seems to be a much better opportunity for a larger consumption.

Increasing substitution has not, however, lowered lumber prices to the consumer. On the contrary, they have steadily advanced, while the cost of many substitutes has decreased. Exhaustion of the stands of local timber and discovery of new sources for the manufacture of other building materials are given as some of the reasons for these changes. More than 75 per cent. of the replacement of wood, however, is made in spite of higher initial cost of the substitute.

The effect of the growing use of other materials has been to accentuate competition and decrease profits in the lumber business. As a result of this and other reasons, alternate periods of curtailment and over-production have made the lumber market unstable. This, in turn, has resulted to the disadvantage not only of the persons whose money is invested in timber and sawmills, but to the many hundred thousands who are dependent upon the lumber industry for their living.

Lumbermen have felt the effect of the replacement of their product by other materials, but have not realized the extent to which it has taken place. They have failed to adopt aggressive selling methods, and have been unable to supply the consumer with reliable information regarding lumber, because they did not have it. A complicated system of grades is in use which is not intelligible to the average consumer, and is even the subject of considerable dispute among lumbermen.

Manufacturers of other building material have spent large sums of money to obtain reliable information about their products. They have had to advertise extensively to make a "place in the sun" for themselves. Substitutes for lumber are guaranteed to meet specifications which are easily understood by the consumer. These facts have combined to make the substitutes increasingly popular.

If lumbermen are to hold their markets against competing materials it will be necessary for them to learn more about the fundamental properties of wood. They can do this either by scientific research for themselves or by co-operating with agencies already established. Better manufacturing and selling methods and the development of by-products should enable them to make a profit in spite of the limitations on the prices of lumber which may be imposed by competing substitutes.

Newfoundland Enjoying Remarkable Trade Activity

Advices recently received from Newfoundland and Labrador are that the summer has been one of unprecedented activity in the sawmills, and that stocks far beyond anything ever conceived there are piled ready for shipment to the best market. The logging season of 1916-1917 surpassed everything in the history of these countries.

Paper and pulp mill men are interested, also, for the timber lands of Labrador are very extensive, with much of it along tide-water and all of it easily procurable at comparatively small cost; small, at least, in comparison with that encountered at various times in the American woods.

The logging season was unusual during the past year, and already crews are being gathered for an even greater output this fall and winter, that is, if men can be obtained in numbers needed. So many experienced woodsmen have been taken into the army by the government that the available supply of experienced men is not great.

There are indications that the early commencement of woods operations, which made the season so successful last fall, will be repeated. Early frosts followed by light snows are ideal for logging in the Northern woods, and there will soon be plenty of them. Last season, excellent weather conditions continued until late spring, with the result that the output from the woods broke all records.

Not only was the cut the largest, but it covered a wider range of grades and quality than has been customary. There was a smaller output of "pit-props," owing to the lack of proper tonnage to England, which is the natural market for these. All the pulp and paper mills increased their stocks to an enormous extent, and the sawmills greatly exceeded their previous totals. A competent authority says that the output of pine, spruce and fir was twenty-five per cent. above the previous season's cutting.

Mrs. H. E. Suckling, 14 Forden Avenue, Westmount, P.Q., has issued an appeal for Christmas gifts in kind or money for the men of the Canadian Forestry Corps. These men are doing splendid work overseas, often near the firing line, and gifts will be much appreciated. Mrs. Suckling states that Mrs. (Col.) J. B. White, of the 242nd Forestry Battalion, with Mrs. (Rev.) Elliott Baker and the officers' wives, are now at work preparing Christmas comforts and gifts for the men, which are to be sent direct to the forestry corps in France and Great Britain.

Trade and Logging Conditions Reviewed

Manufacturers and Wholesalers Agree Regarding Difficulty in Summing Up Present Situation—Logging Costs Still Advancing

The Wholesaler's Market Situation

Editor Canada Lumberman: Toronto, Ont.

I visited the New England States recently and while there called upon the trade, not with a view of doing any business, but for the purpose of finding out how the situation was regarded by the eastern dealers. So far as I could learn, there is comparatively little doing in the way of house building. The retail yards are not very busy. While a great deal of money is spent on buildings, it is almost entirely for additions to munition factories and for manufacturing plants, connected in some way with war orders. Spruce is being sold at high prices in Boston because of the difficulty in obtaining a supply of yellow pine. At the same time, the large wholesale dealers seem inclined to conservatism in regard to future purchases. They all express uncertainty as to the financial outlook for the next six months and are not disposed to enter into extended contracts at the present high prices.

With regard to the local market there appears to be a large decrease in the producton of both spruce and white pine as compared with former years. There does not seem to be much prospect of spruce receding from present prices, unless business comes to a complete standstill through the stoppage of building operations and the cessation of shell box orders.

The stock of white pine is low, as compared with ordinary years, and there have been heavy shipments by water to United States points which will have the effect of leaving a short supply to be carried over the winter at Georgian Bay points. Wholesalers appear to be disinclined to make purchases that will run into next season, and retailers and factory men are also holding back, so that trade at the present time may fairly be decribed as dull.

The supply of hemlock at the mills appears to be larger than was anticipated, but millmen are holding out still for advanced prices, while it is difficult for wholesalers to obtain orders at present. It is reported that millmen are going into the woods with stronger forces than usual this season, and are planning to take out large stocks. Even if this turns out to be correct, the market should not be affected very much until the middle of next year. As I see it, there is a great deal of uncertainty in regard to the financial outlook, and dealers generally are not disposed to extend their indebtedness for new purchases into the next season.

If munition orders are cut off to any considerable degree from Canada, it will mean that many men will be thrown out of work and business generally will be seriously affected. At present, it looks as if the great bulk of the business was going to the United States, where the British Government are obtaining their main supply of money.—Toronto Wholesaler.

Prices Expected to Continue Firm

Editor Canada Lumberman: Toronto, Ont.

Following the declaration of war in 1914, a decided falling off in business took place in the lumber industry, as in other undertakings, and 1915 was a year of uncertainty and caution.

Owing to the uncertainty of development, a very small cut was taken out that winter, and when the demand for lumber for use in making shell boxes sprang up, the available stock cut, and at the mills, was practically exhausted before the new cut was ready.

Conditions throughout Canada, generally speaking, had by this time become more prosperous; commodities of every description advancing in price, labor being scarcer, and wages higher, making everything that entered into the cost of production so much higher that during the past year it has cost very much more to produce lumber than formerly.

With this increased cost, prices have jumped accordingly, and with the possibility of embargoes again on the railroads during the coming winter, manufacturers and consumers have protected themselves with the purchase of ample stocks, and in the majority of cases their yards are stocked to capacity.

Owing to the trade being well stocked, and the falling off of shell box orders, conditions took quite a lull in August, and will probably continue so till some of the stocks in the hands of consumers become exhausted.

The stocks in hand at the mills and in the wholesale distributing yards are much smaller than usual, and with the labor outlook so unpromising, the cost of production so high, we feel that the lumber produced during the coming season will not be in volume enough to depress prices, and that the demand, even if smaller, will be sufficient to consume the available supply of lumber produced.—The Gall Lumber Company, Limited.

Recommends Conservative Operation

Editor Canada Lumberman: Canford Mill, B.C.

During the current year we have operated extensively, running 20-hour shift. The result is that we have done a large volume of business and prices for stock have been higher than normal, but the cost of labor and material is so high that the sum total of the year's business will show not any too favorable a margin.

With this experience to guide us, we now feel that future operations should be conducted conservatively, that large stocks of logs should not be accumulated, and that we should arrange our plans to log and manufacture about in keeping with market demands. Conditions generally are so unusual that it is not a time for speculation, consequently we intend to approach the matter in a very careful way and take advantage of the situations as they develop.

We do not see how there can possibly be any reduction in the price of lumber until the price of labor and supplies declines. We are, however, fearful that the high cost of all kinds of building material and the scarcity of labor will seriously restrict operations and this being the case it is plain that unless the lumber manufacturers of Canada reduce their output there may be an over-production with consequent weakening of prices.

I am confident that the manufacturers will co-operate and regulate their operations in such a way that a living return for their labor may be received. —The Nicola Valley Pine Lumber Company.

Firm Prices Probable During Winter

Editor Canada Lumberman: Toronto, Ont.

It is very difficult to give a reliable and comprehensive opinion of trade conditions at present.

There are wide differences of opinion with regard, not only to the present prices, but to prospective future prices. We are inclined to think that neither the pessimist nor the optimist will have his way. Prices have settled down to a little lower basis on many lines, including hemlock, but the supply is short on hemlock.

In addition to this the demand from the United States is not as great as it was a few months ago. On the contrary we cannot see that there is any more lumber on the market than a quite diminished demand will absorb before next spring.

To sum up, our opinion is, that the price on white pine will be well maintained, this also will apply to red pine, and while spruce has shown a little weakness recently, we think it will come back to its own very shortly. In fact, it is showing evidence of this now. Hemlock may suffer a little through competition from yellow pine, small quantities of which are beginning to come into this market.

We anticipate that when the fall season is over, and we get into the winter, the remaining stocks will be held in strong hands, and prices will be well maintained throughout the winter.—Wholesaler.

* * *

High Prices Expected to Continue

Editor Canada Lumberman: Owen Sound, Ont.

Replying to your query as to present conditions and future outlook in the lumber business, we would say that the prices at present are high, and we can see no chance of them going lower for the next year at all events.

We think there is only a very moderate supply of hardwood lumber in this country, and with any reasonable demand, we look for scarcity long before the new stock comes on the market. With an increasing scarcity of men,, and with increased labor costs, we would consider it a wonder if an average cut were taken out this winter; to say nothing at all of abnormal winter conditions, which are always possible. With any reasonable demand we look for considerable shortage long before the new stock comes on the market.

American prices are ruling considerably higher than ours, and no relief can be looked for from that quarter. Where demands have slackened lately, due to a variety of causes, we have no fear of a glut in the lumber situation, nor any lowering of prices, and we will advise any friend to secure his season's supply now, instead of taking chances later.

Lumber can now be shipped direct from the mill in most cases, without unnecessary handling, which must be done a little later.—Keenan Bros. Limited.

Finds U. S. Hardwood Markets Firm

Editor Canada Lumberman: Toronto, Ont.

The writer has just returned from the South, and finds conditions favorable. True, the market is somewhat spotty in places, but this is accounted for by the fact that the United States has just entered the war, or rather it is only at this time she finds herself really interested, and naturally there is some reaction. However, with very few exceptions, we find prices are strongly maintained, and where there is any reduction it is caused by the fact that in some instances where the mills have been provided with an abundance of

cars they have been tempted to put stock in transit, with the result that the consuming market has been temporarily overloaded.

This condition of affairs, of course, will not last, and we expect the market to strengthen again at an early date.

With regard to market conditions in this country, the prices on hardwoods are considerably lower than those found earlier in the season, and at this time we are hardly in a position to state just what the outcome will be. —The Seaman Kent Co., Ltd.

* * *

B. C. Mills Expecting Good Prairie Trade

Editor Canada Lumberman: Waldo, B.C.

It is our intention to start logging about the first of February, and to log a normal cut this winter, which will be between 13,000,000 and 15,000,000 feet, which amount is a normal cut for this plant in a ten-hour day run. We might add that it has been a practice in former years with this company, together with many others situated in this district, to log what is known as hot logs in the summer season. Since the war has started, however, the labor situation will not permit of this class of logging, and we are forced to cut and skid our total year's supply in the winter months.

The lumber situation at the present time appears to us very hopeful, and the crop that has been harvested in the three prairie provinces, together with the high price the farmers are getting for their wheat, we feel sure will create a good demand for lumber next season. Stocks are very low in the mountain district, and the indications here are that all the available labor will be employed this winter in logging.—Ross-Saskatoon Lumber Company, Limited.

* * *

Scarcity of Stocks and Low Prices Likely to Continue

Editor Canada Lumberman: Burks Falls, Ont.

No one can give more than a guess regarding market conditions—mine will run about as follows: The present condition of scanty stocks and high prices for lumber will continue, in my opinion, until our difficulty in Europe is arranged. The prevailing shortage of labor is likely to increase, thus inducing a tendency to prevent a large crop of logs coming out. So, even with reduced consumption of lumber, present prices are likely to continue or even advance; more likely the latter.—Henry Knight, President of Knight Bros. Company, Limited.

* * *

Scarcity of Men in Quebec

Editor Canada Lumberman: Doreil, P.Q.

We are operating the limits of the former St. Simeon Lumber Company, Limited. We do no logging, but are cutting pulpwood only, and are preparing to cut from thirty thousand to forty thousand cords for this season. We find great difficulty in getting men although we have eight or ten agents in different localities getting us all the men they possibly can.—Provincial Industries, Limited.

The Waste of Hemlock in British Columbia

There is one subject which is worthy of much closer attention than has been devoted to it up to the present—the utilization of hemlock bark as a tanning material.

In 1916 the cut of hemlock in British Columbia amounted to one hundred and one million feet board measure. Taking fifteen hundred feet board to provide one cord of bark, this is equivalent to sixty-seven thousand cords of hemlock bark. The value of hemlock bark f.o.b. shipping point in Eastern Canada and Eastern States is about $14 to $16 per cord. Taking the conservative value of British Columbia hemlock bark at only $10 per cord, the 1916 cut represents a value of $670,000.

British Columbia hemlock bark should be worth more than Eastern Canadian bark, because it contains, on an average, 16 per cent. tannin against only 10 per cent. in the Eastern bark.

Turning to the raw hide question, there are approximately 25,000 cattle killed annually in British Columbia. The hides are shipped out of the country to the Western and Middle States, and leather manufactured at those points is shipped into Canada. Consumers of shoe and harness leather in British Columbia have always had to import their sole and harness leather from foreign countries or bring it from Eastern Canada. Added to this, enquiries are coming to hand frequently from the Orient and from Pacific countries for sole leather. As an instance of the insistent demand, it may be stated that in September, 1916, Japan purchased the enire available stocks of sole leather in the Pacific Coast States and placed further heavy contracts absorbing practically the entire output for six months ahead. So far as the actual demand for sole leather in British Columbia is concerned, a conservative estimate places it at 250 "sides" daily (a side being half a hide). This is equivalent to 120.000 "sides" per year. As above stated, British Columbia produces 25,000 hides (equal to 50,000 "sides") per year, so that the local market would more than absorb our local production of leather.

The above facts would seem to make a very good case for the establishment of a sole leather industry in British Columbia, the raw material being abundant and the consuming market steady.

We now come to the influences which have prevented the establishment of a tan bark and tanning industry up to the present time.

Up till a few years ago Western hemlock was in little demand as a building material, the name suggesting the inferior Eastern species. The prejudice against hemlock was so strong that timber limits containing a large proportion of this timber were almost unsaleable owing to mills finding difficulty in marketing hemlock lumber. Practical education has changed this, and to-day the prejudice of prairie consumers has been removed, Western hemlock commanding a price commensurate with its true value. In addition to this, hemlock is being very largely used as a pulp wood, and its use in this connection will undoubtedly increase very greatly within the next few years.

It may be asked why hemlock bark in British Columbia cannot be marketed and used in the same way as the inferior Eastern hemlock bark, the more so since its tannin content is so much higher? The difficulty is purely an economic one. In Eastern Canada there is a steady demand for hemlock bark at prices which make the peeling and marketing of the bark quite an adjunct to the Eastern timber industry. There the lumbermen send a section of their river-driving gangs back to the woods in early mid-summer to peel and pile tan bark for drying, and before the fall rains it is hauled out of the woods on wagons. On the Pacific Coast this plan is not practicable, owing to the different logging methods in use and to some extent to the difficulty of haulage. Here most of the logging is done by donkey-engines, and the log receives rough treatment in hauling over the ground to the loading deck, the comparatively soft hemlock bark becoming torn and pitted with stones and pebbles, which greatly lessen its market value. Efforts have been made by parties wishing to make experiments on a commercial scale to secure regular supplies of hemlock bark from the loggers, but there appears to be a disinclination on their part to bother with the matter, as they did not feel assured a regular market will exist.

Experiments Needed

This situation is obviously one which should be studied by the provincial forest department. Some way can be found for creating regular supplies of the bark, and it appears to the writer that the best plan will be to demonstrate to the loggers that it will pay them to peel the logs and market the bark. The process of extracting tannin from the bark is a simple one, and the cost of establishing an experimental plant for manufacturing dry tannin extract would be comparatively small. Once the government have assured themselves of the feasibility of the business there is not the least doubt that capital would readily be forthcoming to establish the industry on a large commercial basis. If the manufacture of dry tannin extract were carried on in British Columbia, the product could be shipped to any part of the world, as the freight on the concentrated material would enable it to compete with similar products in the world's markets. Such industry could, without doubt, be established in conjunction with the large and growing pulp and paper industry in this province.

Western hemlock bark has been used as the exclusive tannin agent in at least one tannery in Washington for a number of years. This concern manufactures chiefly skirting leather for saddles. Its larger use has been prevented by the lack of tanneries, due to economic reasons rather than unsuitableness. The prevailing cost of hemlock bark f.o.b. tannery has been $11.50 per cord.—J. H. Hamilton, in Canadian Forestry Jurnal.

Improving British Columbia Plant

J. O. Cameron, president of the Cameron Lumber Company, Victoria, B.C., was in Portland, Ore., recently as a delegate to the Port Conference. Mr. Cameron reports that his company is operating steadily, at both their own plant and that of the Canadian Puget Sound, in Victoria, says The Timberman. At the Cameron Lumber Company's plant a new electrically-driven planing mill, equipped with two Yates No. 91 fast feed machines and a 16 x 20 timber sizer, are being installed; also a box factory with a capacity of 50,000 feet. The equipment in the planing mill and box factory is to replace the equipment which was destroyed in the fire. A Swedish direct connected generator will furnish the electric power. The Cameron Lumber Company is turning out 90,000 to 100,000 feet per day, while the Canadian Puget Sound is cutting 125,000 feet.

The Genoa Bay Lumber Company, at Genoa Bay, in which the Camerons are interested, is cutting 100,000 feet per day. George R. Elliott is the manager. This company loaded the motor ship Esquimalt with 1.600,000 feet for Australia, and is also loading a vessel for Hind, Rolph & Co., of San Francisco, for the west coast of South America with a million feet.

S. H. Fullerton, of St. Louis, president of B. C. Mills & Timber Company, Vancouver, and of the Chicago Lumber & Coal Company, St. Louis, has acquired a principal interest in a new sawmill at White Sulphur, Fernie district, where spruce limits have been secured.

Toronto Trade Resume Meetings

Lumbermen Planning for Important Association Developments During Winter Season

The first meeting of the Lumbermen's Section of the Toronto Board of Trade for the season, was held on Firday, October 12th. There was no formal business to be disposed of, but the members discussed the work of the section, and, as a result, plans were developed for greatly enlarging the work and usefulness of the section. Mr. H. J. Terry introduced the subject and everyone present took a share in the discussion, which centred upon a proposal that the wholesalers of Toronto should form a branch of the section to deal with their special wholesale problems, in manner similar to that of the retailers, who have monthly meetings, taking place in the evening after an informal dinner. The consensus of opinion was that in this way the two branches of the trade could work out the solution of their separate problems most successfully, and that matters of mutual interest to all could be dealt with at joint meetings, held possibly once a month. Numerous suggestions of questions to be dealt with by the wholesalers were made, including the formation of a credit bureau, providing for inspection when disputes regarding grades arise, dealing with transportation matters, etc. It was thought that all such matters could be effectively handled in such a manner and there was keen enthusiasm regarding the proposal.

The upshot of the discussion was a decision to hold a special meeting of the whole section on October 26th, when a good attendance will be ensured by a personal canvass, and the views of all members of the trade can be secured.

From the opinions expressed it seems to be assured in advance that some such plan will be put into operation and that the value and influence of the Lumbermen's Section of the Board of Trade will be greatly enlarged. The chairman will send a circular letter to all lumbermen in Toronto, urging them to attend the meeting on October 26th.

Mr. J. B. Reid, the chairman, introduced a discussion regarding a notice he had recently received from Mr. John Gray, local Grand Trunk freight agent, at Toronto, to the effect that the Grand Trunk would not release cars transferred by a wholesaler to a retailer at Toronto, until he received a cheque for the freight, or an acknowledgement for it, from the wholesaler himself. In other words, the railway would not accept the cheque of the retailer to whom the car was transferred, but insisted upon direct payment from the wholesaler making the shipment. The members present thought that this circular had been the result of the railway having trouble in one particular case where a wholesaler and a retailer disagreed regarding the freight charge, each claiming that the other should pay it, and that the railway company had decided in future to make a rule of demanding payment from the shipper before releasing the car. The members all agreed that they should object strongly to such a regulation, and finally on motion of Mr. A. E. Gordon, seconded by Mr. C. W. Wilkinson, it was carried that the secretary should write to Mr. John Gray, local Grand Trunk freight agent at Toronto, advising him that the section strongly condemned the proposed regulation and inviting Mr. Gray to attend the next meeting of the section as its guest, in order to discuss the matter, before the lumbermen go further and laid it before the Board of Railway Commissioners for Canada.

Central Ontario Retailers Appoint Committee

A meeting of retail lumber dealers from the central district of Ontario, called for the purpose of appointing a committee to represent them at the organization meeting of the Ontario Retail Lumber Association was held at Toronto on September 28. The meeting was called to order at 1.30, and, on motion of Mr. Walter C. Laidlaw, seconded by Mr. W. J. Hetherington, Mr. J. B. Reid was appointed chairman and Mr. H. Boultbee secretary. The meeting was entirely of a formal nature, the members being already closely in touch with the plan that is being worked out for organizing the Ontario Retail Lumber Association. The chairman, however, explained the situation briefly, and urged the retailers to co-operate as vigorously as they could, in order that the association might be of the greatest possible value to its members. He also outlined a few of the matters with which the association would be able to deal, such as legislation, transportation, grading, insurance, advertising, plan books, service, etc.

The subpect was then discussed informally by those present, and, on motion of Mr. Laidlaw, seconded by Mr. Hetherington, it was carried that the meeting express its approval of the proposed organization and appoint a committee to represent it for this purpose at an organization meeting of the general Ontario association. The mover of the resolution suggested the following names, which were approved by the others present: William Barrett, of the Canada Lumber Company, Weston, Ont.; A. C. Reesor, Locust Hill; J. B. Reid, Toronto; T. H. Hancock, Toronto; W. J. Hetherington, Toronto, and William H. Thomson, Port Credit. The name of Mr. W. C. Laidlaw, mover of the resolution, was also added to the committee.

Mr. H. A. L. Swan, secretary of the Ottawa Lumbermen's Credit Bureau, who was present at the meeting, reported that the retail lumbermen of Ottawa were heartily in sympathy with the proposal, and could be counted upon to take steps for the appointment of a committee to represent them at the organization meeting. Mr. Swan also explained the great benefits which the retail lumbermen of Ottawa had obtained through their credit bureau and their co-operative policy.

Another informal discusssion followed, and the meeting adjourned to be called again after the general Ontario meeting has been held.

New Shell Box Contracts Being Placed

The interpretation of the shell box situation published in the Canada Lumberman of October 1 is being borne out by the fact that new contracts for considerable quantities of shell boxes have since been placed by the Imperial Munitions Board, while further contracts are confidently expected. The contracts that have been let recently are for 4.5 in. and 6 in. shell boxes. No new orders for the Bethlehem type of box have been let, and it appears that, for the time being, there will be no business in this box. Information obtained by the Canada Lumberman from reliable sources is to the effect that the Imperial Munitions Board are buying and contracting for 6 in. shells in as large quantities as possible, and that orders for this type of shell will be given in large quantities, and will continue well into the middle of next summer at least. Shell box manufacturers may, therefore, count upon a good demand for boxes for this type of shell. It will not be such a simple matter to produce shell boxes during the coming winter as it has been, because of the scarcity of wide spruce. Manufacturers and wholesalers report that stocks of this kind have practically disappeared, on account of the heavy demand. It begins to look as though some of the thick stock may have to be used, after being resawed, which will involve an alteration in the specifications, so as to permit of possibly a shade thinner material in the finished boxes than formerly.

Three Per Cent. War Tax on U.S. Freight Bills

A despatch from Memphis, Tenn., states that the secretary-manager of the Southern Hardwood Traffic Association is sending out circular letters to members advising them that there will be a 3 per cent. war tax added to all their freight bills on lumber and forest products on or about November 1. He is also advising them that members of the association in Memphis are having rubber stamps made with which to indicate on all quotations that the increased freight cost involved in this government tax will be added to the price of lumber.

There is a tax of 7½ per cent. already imposed by the Canadian Government on lumber imported from the United States. The Canadian Government, however, has ruled that, where there is no specific agreement covering this matter, the tax must be borne by the consignee.

Officials of the Southern Hardwood Traffic Association are rather of the opinion that the necessity for securing licenses and the requirement that Canadian importers must satisfy the authorities in the United States that the lumber they are seeking is to be used in some manner that will contribute to the winning of the war will restrict the movement of lumber to Canada.

Cylindrical Heads Compulsory for Ontario Jointers

The substitution of cylindrical or safety round heads for square heads on jointers or buzz planers in all pattern shops has been ordered by the Factory Inspection Branch of the Ontario Department of Public Works, with a view to eliminate the possibility of serious accidents on these machines. Many woodworking firms have made the change, as the advantage of the cylindrical head over the square head is that it fills the gap or throat of the machine table and the knives project so little that if the hands of the operator should come in contact with the machine they could not be seriously mangled. It is not claimed that it will preclude the possibility of all accidents, but, used in conjunction with the usual guard, it should go far to lower the number of accidents on these machines. The inspectors have been instructed to order the change as outlined above.

Toronto Building Activity Shows Increase

The buildings erected in Toronto during the first nine months of this year exceed in value those erected during the same period last year by the sum of $580,205. The figures for this year are $5,588,845, compared with $5,008,649 for last year. Permits and buildings for the month of September, this year, also exceeded those of September, 1916. The figures are: Permits: 1917, 448; 1916. 387. New buildings: 1917. 522: 1916, 465. Month's business: 1917 $650,271; 1916, $643,272; gain, $6,999.

Poles Purchased in 1916

A bulletin upon "Poles Purchased in 1916" has been published by the Forest Branch of the Department of the Interior, Ottawa. The statistics contained in the bulletin are based upon reports received from 314 firms purchasing poles in Canada. These consist of 176 telephone companies, 100 electric light and power companies, 21 electric railways, 13 steam railways, and 4 telegraph companies.

The number of poles purchased and their value, during 1915 and 1916, by kinds of wood are shown in the following table:

Poles Purchased During 1915 and 1916

Kind of Wood.	1915				1916			
	Number.	Value.	Av Value.	Per Cent.	Number.	Value.	Av. Value.	Per Cent.

Cypress	100	475	4 75	0·1				
Poplar	80	80	1 00	*				

The electric railway, power, and light companies purchased 46,252 poles during 1916, as against 69,398 in 1915. The average value of the poles purchased by these companies in 1916 was $4.45. The average value in 1915 was $4.11.

Steam railways, telephone and telephone companies during 1916 purchased 136,065 poles, at an average value of $1.63, as against 109,850 poles in 1915, the average value of which was $1.51.

There were 3,069 more poles purchased in Canada in 1916 than in 1915, an increase of only 1.7 per cent., but notable as the first increase since 1912. Poles were cut from fourteen different kinds of wood, and of these kinds Eastern cedar composed 78.4 per cent. and Western cedar 13.1 per cent. a total of 91.5 per cent. of cedar. The species next in order was tamarack, which made up 4.8 per cent. of the total. The number of poles cut from Eastern and Western cedar increased, while practically all other species show decreases. Douglas fir, which formed 1.4 per cent. of the poles in 1915, is not reported in 1916.

The average purchase price of all poles has varied as follows in recent years: 1913, $2.22; 1914, $2.33; 1915, $2.52; 1916, $2.34.

The steam railway, telephone, and telegraph companies purchased 74.6 per cent. of the poles, as compared with 61 per cent. in 1915 and 65.7 per cent. in 1914.

The prices in the report are based on the cost at the point of purchase.

During 1916 the poles purchased were divided, according to length classes, as follows: 20 to 25 feet, 54.1 per cent., average value $1.16; 26 to 30 feet, 24.2 per cent., average value $2.26; 31 to 35 feet, 12.3 per cent., average value $4; 36 to 40 feet, 5.9 per cent., average value $5.84; 41 feet and over, 3.5 per cent., average value $9.52.

Cross Ties Purchased in Canada in 1916

A bulletin upon "Cross Ties Purchased in Canada in 1916" has been issued by the Forest Branch of the Department of the Interior, Ottawa. The bulletin is based upon reports received from 34 steam railways and 33 electric railways.

A total of 7,839,515 cross ties was purchased in 1916, an increase of 246,985, or 3.2 per cent. over 1915. This is the first year there has been an increase in the number of cross ties since 1912.

Of the total cross ties purchased 199,099 were treated with preservative to withstand decay. This is 2.5 per cent. of the total, as compared with 5 per cent. in 1915 and 7 per cent. in 1914.

Jack pine heads the list in number of ties cut, with 47.3 per cent. of the total. Jack pine has held this position since 1911, when it displaced white cedar. White cedar still holds well on to second place, the percentage of cedar cross ties being more than double that of hemlock, its nearest competitor.

The average value was 42 cents per tie in 1916, as compared with 44 cents in 1915. Electric railways purchased 3.4 per cent. of the total in 1916, as compared with 2.5 per cent. in 1915 and 1.1 per cent. in 1914. The electric railways paid an average of 44 cents per tie, while the steam railways paid an average of 42 cents.

The number of cross ties imported in 1916 was 622,819, valued at $424,599, as compared with 1,219,594 imported in 1915, valued at $940,407. The majority of these cross ties were of species of wood either not native to or not abundant in Canada, such as oak, hard pine, chestnut, and gum.

The leading kinds of wood purchased for cross ties by the steam railway companies in 1916 were as follows: Jackpine, 3,688,195, average value 39c; Eastern cedar, 1,570,586, average value 45c; hemlock, 569,474, average value 36c; tamarack, 414,367, average value 37c; Eastern spruce, 344,937, average value 42c; oak, 339,712, average value 71c; Douglas fir, 279,092, average value 31c; hard pine, 126,559, average value 67c.

The leading kinds of wood purchased for cross ties by the electric ralways were as follows: Eastern cedar, 72,250, average value 44c; hemlock, 52,232, average value 48c; Douglas fir, 49,622, average value 29c; Jackpine, 40,586, average value 43c; tamarack, 20,466, average value 45c; oak, 14,039, average value 83c.

T. and N. O. Pulpwood and Pulp Shipments

During the month of August the T. and N. O. Railway made pulpwood shipments to Thorold, Toronto, Merritton, Ottawa, Ont., Niagara Falls, Suspension Bridge, Brownsville, Fulton, and Norfolk, N.Y., Johnsonburg, Pa., and Appleton, Wis., as follows:

	Cords.
August 1 to 7	2,384
August 8 to 14	1,763
August 15 to 21	1,802
August 22 to 31	3,158
	9,107

This represents a decrease of 2,261 cords, or 20 per cent., as compared with July, 1917.

Wood pulp and paper shipments were as follows:

	Wood pulp. Tons.	Paper. Tons.
August 1 to 7	491	1,010
August 8 to 14	482	1,309
August 15 to 21	400	1,438
August 22 to 31	306	1,704
	1,679	5,461

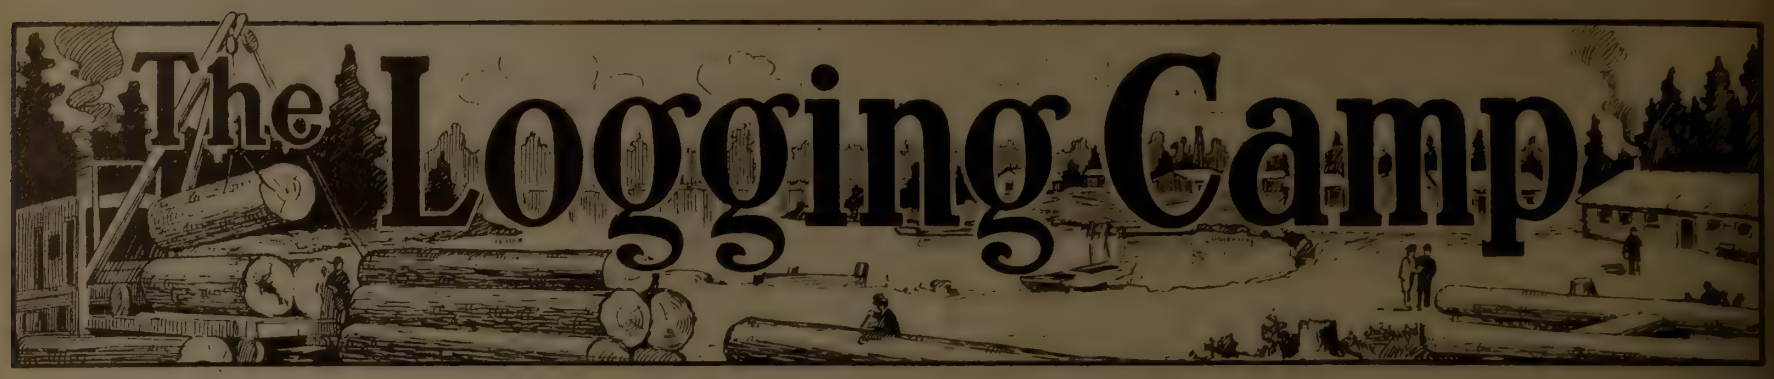
Compared with preceding month's shipments, this represents an increase of 450 tons, or 36 per cent. in pulpwood, and 328 tons, or 6 per cent. in paper.

The New Dollar Mill a Fine Plant

The new mill of the Canadian Robert Dollar Company, Limited, near Vancouver, B. C., which recently commenced operating, will have a daily capacity of from 175,000 to 200,000 feet. The mill is electrically driven throughout. It is located on a well selected site about seven miles from Vancouver, and there is about thirty feet of water at the mill dock at low tide. The dock has a capacity for carrying about 6,000,000 feet of lumber and can accommodate three vessels at one time. The mill will be operated exclusively as a cargo plant. Mr. G. Winkelmann, formerly of the Stimson Mill Company, of Ballard, is manager. In addition to having charge of the mill, Mr. Winkelmann is also manager of the company's logging operations at Union Bay, Vancouver Island. Mr. Winkelmann is one of the youngest mill managers on the Coast, being only 33 years old. He lived in New York until he went West in 1907. He entered the employ of the Stimson Mill Company of Seattle, this being the only company by which he was ever employed in the Northwest. For two years he was in the shingle business, but subsequently returned to the Stimson Mill Company.

United States Shipments Exceeding Cut

Reports to the National Lumber Manufacturers' Association of the United States show that during the month of August 701 sawmills cut 1,385,900,000 feet of lumber and shipped 1,575,800,000, or 13.7 per cent. more than production. Of these totals the cut of softwoods amounted to 1,291,100,000 feet and the shipments of softwoods to 1,455,200,000 feet. Due to strikes and other unsettled conditions, lumber production in August, 1917, was 18.5 per cent. less than in August, 1916. Shipments this year were 6.6 per cent. greater than in the same month last year because of the heavy demand for building material by the government and for factory construction. During the eight months ending August 31, 1917, the mills reporting to the National Association cut 2.7 per cent. less lumber than during the corresponding eight months of 1916, but shipped 7.5 per cent. more than in the same period last year. Secretary Kellogg estimates that the total lumber production in the United States during 1917 will be between 38,000,000,000 and 40,000,000,000 feet.



Eliminating Waste in the Boarding House

The Bridal Veil Lumbering Company, Bridal Veil, Ore., has adopted a new system of boarding house reports, the object of which is to determine the amount of food used per man per meal and the cost of serving each meal. The purchasing agent of the company, in an article in The Timberman, says:

The company has determined standards of weight of food supplies per man per meal, and in order to keep records of the boarding house service in a simple way they have divided the food served under the following general heads: Meat, Milk, Butter, Eggs, Lard, Flour, Vegetables and Fruit, Sugar, All Other Groceries.

Under "vegetables and fruit" are included all fresh or canned vegetables and fruit. The important and more expensive items are considered under separate heads.

Under any general head individual studies may be made. If, for example, it is desirable to make a close comparison of what the various cooks are doing with potatoes, this item can be singled out for special study. Weight can be taken before peeling and after peeling. The exact amount of waste due to peeling can be determined, and if some flunky is careless or wasteful his waste can be detected very quickly.

Added to the cost of food supplies consumed per man per meal is the cost of labor, fuel, laundry, rent and light, and all other expenses,

Comparative monthly Boarding House Report.

determined per man per meal. The total of food supplies added to the labor and other costs gives the exact cost per meal. The particular advantage in segregating labor and other costs from actual food costs is that one can make a simple and comprehensive comparison of each cook's work in terms of pounds of supplies used.

More Weight Than Army Ration

The comparison is made on the basis of pounds of food used per man per meal. The United States Government allows for garrison ration about one and one-half pounds per man per meal. Owing to the fact that the company serves fresh vegetables and fresh fruit its weight per man per meal is somewhat in excess of the government rations. The government uses more concentrated foods.

Through the medium of the reports the company has been able to detect waste on the part of its cooks, and it is found that they are only too glad to co-operate to eliminate waste when their attention is called to it.

The Bridal Veil Lumbering Company has also inaugurated in its camps a sandwich lunch.

Report by Pounds Essential

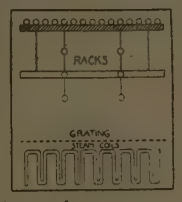
The writer has been associated with the camp operations for many years, and the reports used are the results of study of many reports of this nature. It seems that with the shortage of the nation's food supply the report in terms of pounds per meal rather than dollars and cents is especially important at this time. It is fundamental and important at any time.

In order to convert items that are not sold by the pound a weight book has been devised, which converts supplies sold by the dozen or otherwise into pounds.

Camp Cars with Dry Rooms

The Cherry Valley Timber Company, Stillwater, Wash., has added several new camp cars to its equipment, which include a bathroom 14 x 18 feet, a dry room 14 x 22 feet, and a bunk room 14 x 20 feet. The dry room is an interesting feature of these cars, and the arrangement of the drying racks may be seen in the accompanying sketch. The small diagram illustrates an end view of the dry room, showing the 15 overhead racks, 2 longitudinal racks, and 1 rack across the end. There is room for two additional longitudinal racks if desired. The racks are arranged over steam coils on the floor, covered with a wooden grating. The racks are made of old one-inch galvanized pipe.

Floor plan of dry room car.



End view of dry room car.

The dry room is connected with the bathroom by a door, as shown in the floor plan illustrated herewith. The company reports that no need is experienced for a laundry car at present, as a commercial laundry renders weekly service. Hot water and soap are provided at all times for men who desire to do their own washing.—The Timberman.

Magnitude of the Logging Industry

There is sufficient privately-owned railroad trackage in the West, devoted exclusively to the removal of logs, to build a single line of railroad from Portland to Chicago, with nearly enough more to build a double-track road from Chicago to New York. In other words, the total logging railroad mileage of the West aggregates almost 4,000 miles. In addition to this, there are several hundred miles of trackage owned by the transcontinental lines extending into timber tracts, which depend almost exclusively on the tonnage derived from the removal of logs and forest products.

The segregation of this trackage is approximately as follows: Washington, 1,850 miles; California, 750 miles; Oregon, 600 miles; British Columbia, 325 miles; Idaho, 200 miles; Montana, 85 miles; New Mexico, 70 miles; Arizona, 55 miles; Nevada, 30 miles.

The motive power used on these logging railroads includes some 600 geared locomotives and about 270 direct-connected locomotives, making a total of 870 engines of both types. There are in use about 8,000 logging trucks and about 5,600 flat cars, making a total of 13,600 logging cars of both types. Gasoline cars and speeders number 225.

There are 2,600 logging engines (donkeys) used by companies operating logging railroads in the territory embraced in our survey. Other equipment totals as follows: Overhead systems, 240; steam shovels, 50; locomotive cranes 32; steam skidders and loaders, 63.

The combined daily capacity of logging concerns in the West operating logging railroads is aproximately 60,000,000 feet, requiring a total of 55,000 men.

Chain Drag Saw and Log Measuring Device

By W. D. Starbird, reproduced from The Timberman

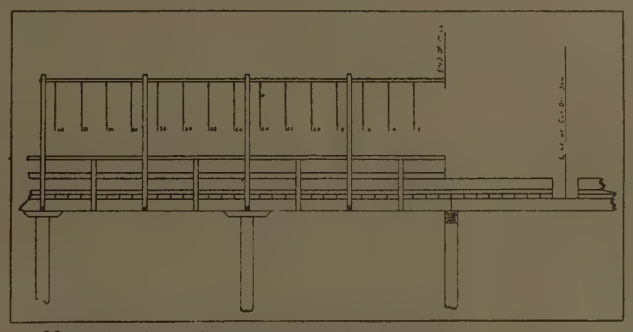
I have recently had an opportunity thoroughly to try out the merits of the chain saw for cutting up long-length logs on the log deck of a sawmill, and will endeavor to give here a description of this and other devices made use of in connection with it, and a few suggestions regarding its possibilities and purposes to which it may be applied.

Some years ago a concern, whose name I have forgotten, secured a patent, or at least applied for one, and undertook the manufacture and sale of a chain saw machine, designed for the special purpose of cutting up long-length logs in a sawmill or on a mill pond. One of the machines was installed by the Potlatch Lumber Company, at Potlatch, Idaho, where it first came to my notice and aroused my interest. This machine has been in use for several years now, and, while it was not an entire success as originally built, it has, with a number of improvements made by the operators, developed into a quite satisfactory machine for the purpose intended.

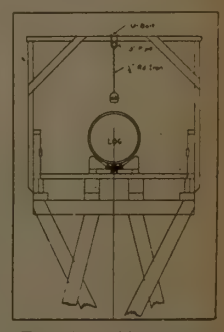
Construction of Chain Saw

The chain saw is built up of segments of band-saw steel, riveted together and having cross-cutting teeth and rakers on the cutting side and lugs or sprocket teeth on the back edge. For use in cutting up logs, it is driven by means of a specially-designed sprocket, mounted on a shaft, driven either by motor or belt and stopped or started by use of a friction clutch. A suitable frame is provided on which to mount the shaft, with a guard to prevent the saw from doing damage in case it breaks.

In order to make the saw practical and satisfactory in operation it must be supported and guided through its length. For this purpose a blade built up of two pieces of band-saw steel, about 14 gauge, with a filler of the same material somewhat thicker, all riveted together, has been utilized. The lugs or sprocket teeth slide in the groove left by the filler plate of the blade being cut below the outside or guide plates. The chain saw, being made up of alternately three and then one segments of steel, leaves every other section of three thicknesses the same as the guide blade, so that the back of each alternate section of the saw blade rests on the outer pieces of the supporting guide blade. The guide blade and the saw can be made any length desired.



Measuring device for determining the length of logs as they are being drawn into the mill.



End view of log measuring device showing details of construction.

At the outer end of the guide blade a loose sprocket is attached by means of a light casting, which is provided with an automatic take-up and spring tension. This casting also provides a guide head, which slides loosely and freely in guide bars fitted to the circle required by the length of the saw and blade. The spring tension keeps the saw strained to a sufficient extent to prevent its buckling and jumping off the top or slack side, which it has a tendency to do when traveling at a high speed. The guide blade and saw are raised and lowered by means of a flexble wire fastened to the cast head attached to the outer end of the guide blade, brought up over sheaves and down to a small drum with crank attached, which is used to wind and unwind the rope, and placed in a convenient location for the operator to handle on the frame supporting the drive shaft. The drive shaft acts as an axis on which the guide blade swings. This makes up the equipment of the chain saw machine.

To utilize this machine or similar device on the log deck of a mill, in cutting up long-length logs, when brought in by means of an endless chain and slip, provision must be made for stopping the log accurately, at any desired length, without delay. For this purpose a machine has been designed which works quite satisfactorily if kept in proper adjustment. Heavy iron bars are set at the desired distances from the saw blade, with a substantial cast-iron guide plate fitted on the side of the log slide. There may be any number of these bumper bars, and each one is connected to a clutch arm, fitted loose on a shaft of the required size and length, on which they are held in position by a solid collar. The bars are each two feet apart, and between each two clutch-arms there is placed a sliding clutch to match them, fitted with feather keys to the shaft. The shaft is turned the distance required to push the bumper bars upward sufficiently to catch the log, regardless of its size, as it is carried forward by the haul-up chain, by means of a

steam cylinder controlled by the operator at the chain saw machine. Each of the sliding clutches is provided with a yoke for holding them in position and moving them to engage or disengage with the loose halves which operate the bumper bars. The bumpers are set for any length of log desired by means of levers located within convenient reach of the operator of the chain saw machine, which are connected with the clutch yokes in any manner found most convenient for each particular installation.

Handling the Log

For holding the log in a rigid position while being cut off, log grips, consisting of four heavy cast-iron jaws with wrought teeth, are used. The jaws of these grips are four in number, two on each side of the chain saw, one being on either side of the log. They swing on a shaft set, one on each side of the log slip, and are closed and opened by means of a steam cylinder, controlled by a foot treadle placed within convenient reach of the chain saw operator.

This makes up the equipment on the log deck, but in using this method for cutting up long-length logs the writer found that it was very difficult to get the logs cut to the best advantage without some means of telling the exact length of the log to be cut up, before it was placed against the bumpers ready to saw in two. An effort to have the logging department mark the length of all logs in the woods brought out the fact that it was impracticable o do so, on accoun of the expense and trouble it would cause.

The Measuring Device

Therefore, a measuring device was finally built over the log slip, commencing 12 feet in front of the chain saw machine and extending to the required distance to cover the length of the longest log handled. The accompanying sketch shows the method of its construction.

For handling long logs and cutting them to length inside the mill it is necessary to have the log slide built level for some distance before the log reaches the cut-off saw, usually for about the length of the

Chain drag saw used by the Great Northern Lumber Company.

longest log to be handled. The log slide should have, and usually does have, a walk along each side, with a railing on the outer edge about three feet in height. A framework is built up along this railing with cross girts overhead at a height of about nine or ten feet. A piece of two-inch steam pipe is suspended from the under side of these girts by means of U-bolts, commencing at a point 10 or 12 feet from the cut-off saw and extending the required distance to cover the length of the longest log to be handled. A hole is drilled through this pipe every two feet, and an eye-bolt with a piece of half-inch round iron, having a marker plate attached to its bottom end, is attached. These rods, which hold the marker, extend down to about four feet above the bull chain, and both the rod and the marker are attached in such a manner that they swing freely in either direction. This brings the marker close enough to any size of log to indicate its length at a glance, and, in the case of an exceptionally large log, the marker can swing freely out of the way. The operator of the cut-off machine necessarily has to stand back from the log slide some distance, and the angle of his vision in looking out over the length of the log is such that he can readily determine how long it is, by means of these markers, without leaving his position, and thereby judge what length to cut the logs into, without stopping the chain.

The combination of these four devices makes up a very complete equipment for the cutting up of long logs on a mill log deck, and if properly installed and kept in working order will prove very satisfactory in operation.

Plate With Inserted Teeth Suggested

The weakest point in the chain saw is the rivets which fasten the separate segments together. They are subject to considerable strain and wear, and when worn to a certain extent are apt to shear. It has seemed to the writer that there is a chance for important practical improvement in the method used for connecting the segments, and also that a plate with inerted teeth might be utilized to good advantage, making the saw blade practically indestructable. This would be of special advantage if a means for connecting the links or segments of the chain saw were improved, so that there would not be the present difficulty of rivets wearing and shearing.

If these difficulties were overcome, I believe there would be a much larger field for the chain saw. It is light and can be made portable to much greater advantage than any other wood-sawing device. It is flexible, and does not require any great amount of power to operate. The power it now requires can be greatly reduced by means of improved rivets and inserted teeth, which would permit the use ot thinner material in its construction and consequently less swage or set. There would seem to be a field for it in the woods for felling timber, specially large timber, and for bucking up on landings. Also for cutting up shingle bolts and all lengths of wood for fuel. There would no doubt be many other uses to be found for it as fast as its practicability could be demonstrated, and about which I think there is little doubt or question. One notable feature of the chain saw is that it can be operated horizontally as well as vertically.

By the use of electrical or gasoline power the chain saw could be utilized to the very best advantage for cutting up long logs on mill ponds instead of in the mill. A cheaper installation with much less equipment would answer the purpose on the pond.

Fresh Vegetables for Lumber Camps

Anyone who is acquainted with the difficulties connected with the labor problems in lumber camps knows that conditions to-day are such that only the greatest possible consideration for the welfare and comfort of the camp employes can be counted upon to attract and to keep them. Comparing the camps of the old days and their rough and ready, but extremely unpleasant, accommodation and poor food. with the camps of to-day, the improvement that has been brought about is at once recognized. With such a labor market as that which now exists, it has become all-important to pay great attention to these matters. A glance through the advertising columns of the Canada Lumberman will quickly convince anyone that many a man living in the cities in want or discomfort would be better off by far if he went to a lumber camp. The variety and high quality of the meals furnished in the lumber camp to-day would astonish anyone who was acquainted only with the camp menus of a few years ago. In fact, there is no laboring man in Canada who fares better than the lumber camp employees.

An indication of the way in which this variety of food is secured is afforded by the advertisement of the firm of Duncan's Limited, wholesale fruit, produce, and commission merchants, North Bay, Sudbury, and Cobalt, which appears in this issue. This enterprising firm makes a specialty of furnishing fresh vegetables to lumber camps, and is prepared to ship in mixed cars for immediate use or for winter storage. Potatoes, cabbage, carrots, turnips, beets, and parsnips are a few of the many lines they handle. It will pay camp managers who wish to feed their men well and to give their camps a reputation for good meals to get in touch with this firm and learn how it can be of service to them.

Saw Manufacturers Busy

Mr. H. J. Cooper, sales manager for R. Hoe & Co., saw manufacturers, New York City, recently visited the company's trade friends in Ontario, and while in Toronto favored the Canada Lumberman with a call. Mr. Cooper reports that business in the saw line is good, indicating a healthy activity among lumber manufacturers and woodworkers. As an indication of this he said that while his company could usually find an opportunity, during the summer months, of catching up with their orders and getting squared away for the increased business which comes in the cold weather, they had not had such an opportunity during the present year, as business had been too active. Lumber manufacturers in the United States, he reports, have been very busy, particularly since the government came into the market with its large requirements for the erection of cantonments and construction of airplanes, wooden ships, etc., and he foresees continued activity ahead of the industry for an indefinite period. To some extent, however, this activity may be restrained by the great shortage of labor which is now being increased by the drafting of men for the armies of the United States and Canada. Mr. Cooper is well pleased with the trade situation in Canada, reporting that, in spite of th absorption of the country's efforts in the war, there is a steady and encouraging market for all kinds of saws and saw parts.

H. W. Baillie, president of Canadian Aeroplanes, Toronto, has been on a visit to British Columbia investigating the question of spruce supply. He went north to the spruce districts. He said that much of the spruce from Washington and Quebec was being used for aeroplane work, but the British Columbia material, with its greater length and greater diameter was exactly what was wanted.

A Splendid Example of Patriotism

Seven Sons of G. D. Campbell, Weymouth, N.S., Volunteered —Six to the Front—One Pays Supreme Sacrifice

From time to time it has been our privilege in the Canada Lumberman to tell of the patriotism of members of the lumber industry who have taken their share in the European struggle, and, all too frequently have laid down their lives in the fight. No more stirring tale of patriotism has come to light since the war began than that afforded by the members of the Campbell Lumber Company, Limited, Weymouth, N.S. The six sons of Mr. Campbell, who went to the front are Lieut. Glidden Campbell, 85th Highland Brigade, C.E.F.; Corp. J. Duncan Campbell, 87th Highland Brigade, C.E.F.; Lieut. Kenneth A. Campbell, 42nd Black Watch, Royal Canadian Highlanders; Gunner Thomas B. R. Campbell, C.F.A., 3rd Toronto C.E.F.; Driver Albert M. Campbell, C.F.A., 58th Howitzer Battery, C.E.F., and Lieut. Colin G. P. Campbell, M.C., 5th Canadian Reserve Brigade, R.F.A. No less than 120 employees of the company also joined the colors.

Lieut. Glidden Campbell has since been promoted to Captain, and Gunner Thomas B. R. Campbell is now in hospital, and the other sons are in active service at the front. The story of the six soldier sons is told in a letter from their father, G. D. Campbell, to E. F. Perry, secretary of the National Wholesale Lumber Dealers' Association, of New York, in which Mr. Campbell says:

Dear Sir: Replying to yours of the 15th, I have to say that not only the members of the firm, but six of my sons are in the war. My sons are grandsons of a brother officer of Lee, Grant, and Franklin Pierce in the Mexican campaign in 1848, who was wounded twice at Churubusco or Chapultepec and Contreras, and they are also great, great grandsons of officers who fought in the Revolutionary War both on the king's and patriots' sides of the contest.

All seven of my sons volunteered for the war, but I kept the eldest home to keep the business together and take care of the property—like David, "to keep the stuff."

At Vimy Ridge Kenneth was killed, Duncan wounded and Glidden went through the thick of the fight with distinction and helped to win that section of the front. Colin was first wounded at LeBasse, June, 1915, and received "multiple wounds" in July 18, 1916, when he won the Military Cross at Death Valley beyond Crucifix Hill near Courcelette.

My six sons made up a total of fourteen cousins in the war in 1914 and since the United States has come in three more cousins have joined, making seventeen cousins in all, fifteen in the army and two lieutenants in the navy. Three of my sons have commissions and not a man of the fifteen was in the army before the war; but all responded to a man when the Beast and his Huns struck inoffensive but brave little Belgium. Surely the spirit of those who bled and those who died at Charleston in 1781, in the Peninsula in 1800, in Belgium when the "Scourge of Europe" was brought to book, at New Orleans in 1814 in "Jackson's Defense," and in Mexico in 1848, is not shirking in 1914 in the present struggle of duty and sacrifice for freedom's cause and against aristocratic brutality or the divine right of Kaiserisms' Kultur.

Verily, gentlemen, "It is the spirit that quickeneth" and surely, surely the flesh profiteth nothing unless so animated by the example of our fathers who struggled upward from the Magna Charta to the Marne, Courcelette and Vimy Ridge.

Surely the time has come when the order given by the Great Commander going Himself to Calvary with but two swords in His little company, which to me all the three-score years of my life has been utterly incomprehensible, is now made plain, when the utterly helpless have been so ruthlessly struck; "Him that hath no sword let him sell his garment and buy one."

Yours very truly,

G. D. CAMPBELL.

P.S.—My sons, reared in cleanliness and comforts of plenty, have written from the front and hospitals of fighting through filth and stench, of "men unburied for three weeks" and of horses lying until their bones bleached ere the ground could be won; of the only water to drink drained from such battlefields, of lice in the trenches from which there was no escape, until, as Duncan writes, he thanks God for the three wounds that sent him to the hospital and "a clean bed once more." Covered with mud and amid the roar of guns, two of them took the Sacrament together before "going in" at Easter and the only thing, animate or inanimate, that was clean was the "fair altar cloth."

Suggestions by a Saw Expert

A saw is very much the same temperament as a child. Its future depends largely on its early training. To be more explicit, if a saw is ground carefully and accurately and the blade is put in A1 condition before it is allowed to make its initial run, that saw will give better service throughout its entire life than one that was allowed to go on the mill before being thoroughly ground and benched.

I have always made it a rule to pay particular attention to fitting a new saw, and what is just as important as putting it in perfect condition before its debut on the mill is to go over the blade every run for at least one week, or until you are confident it has become thoroughly "seasoned." (It is unreasonable to expect the manufacturer to fit saws at the factory so that they will conform to the peculiarities of each of the many thousand mills now in operation.) Of course, there is no fixed rule for the proper time of benching; this depends almost entirely on the make of the mill, the condition of the wheels, and many other things too numerous to mention here; but, under ordinary conditions, I am opposed to too frequent benching. Put the new saw in A1 condition, look it over every run for a week or ten days, and it will not be necessary to bench it more than once or twice a week thereafter. Too frequent benching will make a saw prematurely old.

From my point of view, the most important part of filing is the proper care of the teeth. A saw that has a good, sharp, uniform tooth, with plenty of clearance, will make good lumber, even if the tension is not perfect; on the other hand, if the tension is perfect, it will not make good lumber if the teeth are irregular, out of alignment, or swaged poorly or not properly ground. Right here I want to say a few words in regard to that most important of all machines used in the filing room, the grinder.

A saw, to do the maximum work, must be accurately ground, and to do this the grinder must work perfectly; therefore, I have always made it a rule to go over the grinders thoroughly at least twice a week, cleaning them thoroughly and making sure the most inaccessible parts are well lubricated. If this rule is adhered to, you will undoubtedly see the results of your labor in the finished board.

Of course, the swage and shaper play a very important part in the proper upkeep of saws, as there is nothing that tends to weaken a saw as much as a poor swage. Good, sharp corners are absolutely essential for the manufacture of good lumber. Quite often a poor swage is the direct result of the grinder working badly, as there is no swage made that will do good work if the points are case-hardened, if the tooth is too heavy or too slender just back of the points, or if the face of the swage on the tooth is not ground perfectly square.

There are several—in fact, numerous—reasons for a swage working poorly that are traced directly to imperfect grinding. Taking all this into consideration, I do not think I am far wrong when I make the assertion that the grinder is one of the most important tools used in the trade. One of the chief characteristics of a grinder that is not working properly is an irregularity of gauge at the points—that is, on a fourteen-gauge saw, for instance, some points will gauge eight, while others will gauge nine or ten. This necessitates too frequent swaging, which, in turn, will quite often cause a crystalization of the points; every filer knows the result—an epidemic of "crumbling," which is very annoying to say the least, as it means bad lumber and is very trying on the blade.

I have said in my opinion the proper care of the tooth is the most important part of the trade, but, as a matter of fact, each and every detail of filing is an important one, and one that can't be "half done"; in fact, those who have made a study of the business of filing and are also familiar with other mechanical trades, such as electrical engineering, steam engineering, etc., will invariably acknowledge that the first named is decidedly the most scientific.

To verify this assertion we will draw a comparison between the two trades, electrical engineering vs. saw filing. It is a proven fact that an electrical engineer who can wire an office building in San Francisco in accordance with the specifications, etc., can also wire an office building in New York; but a filer who is considered an expert in the West will find conditions in the East quite different, and many details will confront him that are materially different from those in the West, which will call forth every particle of ingenuity and mechanical ability to overcome; this is also applicable to the filer who migrates from the East to the West, as is quite often the case in changing positions even when the mills are located within the same state.

There is no higher mathematics entering into the study of filing, but it requires several years of actual, practical training a good bit of resourcefulness by one that is a natural mechanic to master the trade. —R. R. Hazlett, in the Simonds Guide.

U. S. Lumbermen Admire B. C. Methods

The coast British Columbia manufacturers are a sane lot. They found that the log supply was mighty scarce and orders from the prairies were not coming in very fast, so they decided to slow down to five days per week for a while and let the supply of logs and orders catch up. The mountain mills are still working six days, owing to their short season of operation. The fir manufacturers of Oregon and Washington could well afford to take a leaf out of the book of experience from their British Columbia brethren. The same conditions are facing the fir mills on this side of the line. Nine months' operation, taking one year with another, is quite sufficient to supply the market. The twelve months' mill simply shuts the other fellow down sooner or later. The demand fixes the output in the long run.—The Timberman, Portland, Ore.

Building Associations and Lumber Trade

Retailers and Manufacturers Urged to Adopt Plan for Promoting Home Building and Owning in their Communities

By J. R. Moorehead*

It is in the mind of every well-balanced man to own a home. Particularly is this true when he becomes the head of a family. This desire is no greater in the head of the family than his wife, and their growing children. This has been true in all ages. Whether this home has been a tent of grass or skins; a stone house carved in the cliffs; an Indian tepee, or a modern bungalow,—the desire has been the same.

There is no necessity for arguing whether the Building and Loan Associations have been a success. We have only to point to the city of Philadelphia, which is known as the city of homes, due to the early development of the Building and Loan Association. Other cities and states have so progressed in this direction that hundreds of millions of dollars are loaned largely for the purpose of procuring homes for those who would not otherwise be able to obtain loans and, through co-operative effort, satisfy their desires.

There are many plans. While the fundamentals are much the same, yet there is a wide difference in detail as to form and manner of conducting such organizations. What we shall have to say at this time does not apply to the smaller communities where lumber yards are located and where the business of that community is largely, if not wholly, dependent upon farm trade. The Building and Loan Association has not yet been applied or adapted to any general use by farmers for obtaining loans for purchase, improvements and other purposes.

The present is one of the most opportune moments in which to discuss the possibility of the Building and Loan Association, insofar as it will increase the sale of lumber and building material and thus promote our business. It is entirely with a view of bringing this matter to your attention at this time in order that plans may be laid for better securing the foundations and future of the lumber business.

Promoting and Securing Trade

It should be the aim of the retailer, not only to secure the lumber bill in sight, but to do and perform those things which will bring business in the future. If we have not this foresight and eye to the future, then we have missed one of the principal factors in the success of our business. Only in well-laid plans for the future can we hope to succeed, and it is with this in view that we lay before you under this caption some suggestions which appear to afford a means of co-operation that will result in greater and better business for all branches of the trade in years to come.

In the success of a properly conducted Building and Loan Association, we can see the success of those other agencies now being employed to promote the sale of lumber and building materials. Plan books and selling helps will become more valuable and indispensable when we provide the finances.

The great problem in most communities is that of securing funds by those not in possession of sufficient finances to obtain their own homes. Banks do not and cannot lend money on long time to home-builders. Funds are not obtainable from other sources for such purposes, except occasionally, possibly, from private sources. The deposits in the Savings Banks may reach the millions, but these small earnings are not available for the purpose indicated in this discussion, particularly the obtaining of funds for the building of the small home for the wage earner, the clerk, and the business man in the small community, without sufficient funds. To create sufficient funds, therefore, seems to be the problem, and the Building and Loan Association is the only means whereby an accumulation or collection of small earnings can be obtained upon terms equitable and possible to the borrower.

The other difficulty seems to be the lack of any one in the average community with sufficient knowledge of details to inaugurate and start a Building and Loan Association. We believe it is possible for the Manufacturers' and Retailers' Lumber Associations to solve this problem.

A Practical Plan

Personally, we have always depended more upon experience than upon theory as to how problems of this kind should be solved. Thirty years ago in my home town, I was one of the promotors of a Building and Loan Association. For five years I was secretary of this association and conducted it in my lumber office. Today that association has assets to the amount of $490,000. The expense for the past year (the largest business in its history) was, including salaries and for every purpose, $2,418. I do not recall a bank with a like capital and assets which conducts its business for an expense less than three times this amount. The very first loan made by this association in 1887 was for the purpose of building a home for a blacksmith, and at least one lumber yard in my community immediately began to get beneficial results from this organization, though only thirty days old. During the thirty years of the existence of this organization, so far as I recall, the association has suffered only one financial loss, and that an amount of less than $400, which means practically that in the thirty years' business, this association has lost nothing, because of bad loans.

In the Building and Loan Association the normal hazard is practically eliminated, and the moral security is practically as great as the real estate.

When this organization was first started, there was intense opposition on the part of the banks in the community, it being intimated that a scheme was now being started to lose a considerable amount of money of working people, who could ill afford it. There was fear, no doubt, that it might interfere with bank deposits. It does not. On the other hand, it increases bank deposits. Small sums come out of socks, tin-cans, etc., and thereby get into the banks. Within three years from that time, every bank in the community had a candidate for treasurer of the organization.

We are not prepared to say just the number of homes which have been erected with the money obtained through this co-operative effort, but we can safely say that the lumber and material men of the community, where I formerly lived and still own a yard, have had their business increased anywhere from ten to forty thousand dollars each year by reason of its existence, and, had not such an organization been formed in my town when it was, the community today would not have reached that stage of development which it has; the mechanics, and laboring people, and business men as well, would not have been living in their own homes, as they are today, and, further, I should not have continued in business there myself.

The community, if it had improved to any extent, would have been one largely controlled by landlords, instead of home-owners. Now, hardly anyone lives in a rented house.

A Paying Proposition from the Start

My proposition, therefore, to the combined lumber industry of the country, to the manufacturers and the retailers, is this—provide a proper number and finance a sufficient number of men with sufficient knowledge to go into any community and properly guide those interested in the organization and installation of a Building and Loan Association. I do not mean that the National Lumber Manufacturers' Association should bear all of this expense. Any retail lumberman in any community where an association is established can afford to pay out of his own pocket at once anywhere from $100 to $500 in order to start such an organization under proper instruction. If by the investment of such an amount, an additional business of five, ten or perhaps twenty thousand dollars a year can be secured for his yard, he can have no better investment.

My own experience is the warrant for making such a statement. There is everything to gain and nothing to lose. If I were the owner of ten, twenty, fifty or one hundred retail lumber yards, I should employ the best Building and Loan man obtainable and have him make a survey of every community where I owned a yard with a view to establishing a Building and Loan Association therein. I would call together my competitors and other business men, including the local newspaper men, in the community, who are as much interested as is the lumberman, and present the proposition to them in a practical, straightforward business way. If I could secure the co-operation of my competitor, well and good; if not, I should proceed on my own account, and install an association in my lumber office. Any retail lumberman who is looking to the future cannot but see that this would be building a future business.

It is of very little importance what rate of interest Building and Loan Association members pay. It may be very large, but if all pay the same, there is no burden. The larger the interest, the quicker the maturity of the stock and the sooner does the home-owner come into entire possession of his property.

Frank L. Nash, manager of the Shingle Agency of British Columbia, Vancouver, is beginning the publication of a daily market report to members of the agency. Mr. Nash was formerly of the American Lumber Company, Seattle, and succeeded Mr. R. Hyde, who has taken the position of sales manager for the Huntting-Merritt Lumber Company, Eburne, B.C.

* Secretary-Manager of the Southern Lumbermen's Association, Kansas City, Mo. Extracts from an address before Lumber Retailers and Manufacturers at Chicago, October 10th.

The Passing of the Carpet

By W. L. Claffey

A PROMINENT physician in a lecture on sanitation once said, if the old-fashioned carpets, which cover the entire floor, were eliminated and oak floors and rugs used, that the health of the family and community would be greatly improved. The carpet is the champion collector of dust and germs, and to keep a carpet thoroughly sanitary it would be necessary to wash it or steam it every week or two, and, of course, this is not practical, so the best thing to do is to get rid of the carpet. Anyone who has been around a spring cleaning and caught a view of the dirt which has sifted through the old-fashioned carpet was certainly appalled at the sight.

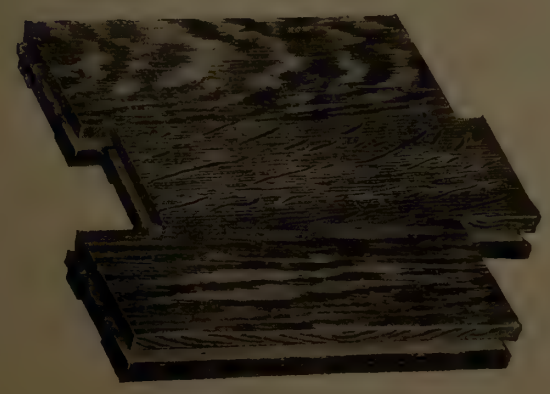
The manager of a rug department of a large department store remarked recently that they practically have no demand for the old-fashioned carpets for covering the entire floor. The carpets that they do sell are usually for runners, or are made up into rugs. This can easily be verified when visiting other peoples' homes, where you will invariably see oak floors and rugs. A recent survey in Chicago in three square blocks revealed the fact that 95 per cent. of the houses or apartment buildings had oak floors and rugs.

Women are responsible for the modern oak floor and rugs. They were quick to recognize that oak floors and a few choice rugs created an artistic appearance and simplified house-cleaning and housekeeping. With the advent of the apartment building, which meant rented apartments, and the unstable tenantry, the old-fashioned carpet had to be cut and fitted almost every time the removal period came around. This made great inroads into the expense account. Rugs of any reasonable size will always fit in any house or in apartments.

Nearly everything these days is based upon appearance. When an owner erects a home, the first thought is, how the building is going to look from the outside. After this the details of the arrangement of rooms, the flooring, the finish, the furniture, the rugs, and the drapes. All are given special attention in order to get the proper artistic effect. Some of the department stores in large cities have unique ways of exhibiting furniture, rugs and drapes by actually building a small cottage in their stores and equipping it completely from the kitchen to the living room. Visitors in this way oft-times get very valuable suggestions for their home.

The modern oak floor is the result not only of a long process of evolution, but also distinct changes in the ideas of living. Oak floors are also responsible for the re-arrangement of rooms in the modern house, such as eliminating the parlor, the location of the dining room in front of the house, the breakfast room, the garage in the cellar, etc. One innovation leads to another, and women get the blame, at least from the architects and builders. Oak floors today have ceased to be a luxury, due to quantity manufacture; in fact they have become a necessity in every home, from the mansion to the small modest cottage. Oak flooring is peculiarly suitable for homes, as its color is a rich brown and blends perfectly with all kinds of furniture and decoration.

There is many an old house today that remains unrented because the old pine floors look very shabby and uninviting. If the owners of these buildings would lay 3/8 in. oak flooring over these unsightly old floors it would undeniably make a splendid investment. It would attract a better class of tenants or buyers, and would increase the renting or selling values. A floor is the very first thing that you observe when entering a building, and about the last thing that you see when going; in fact it is the most important part of the interior construction.



A sample of oak flooring.

Astute landlords will invariably emphasize oak flooring in the daily papers when they offer their house for rent or for sale. This gives the impression that the house is modern, and that all the other material used is of a high class standard.

The average home builder, and even the contractors, are often misled in regard to prices on oak flooring. Comparative prices clearly indicate that oak flooring is by far the cheaper.

A fair average price for a good body Brussels carpet would be about $2.50 a carpet yard. A carpet yard contains 6¾ square feet. Let us figure it out for a home having a living room 14 ft. x 14 ft., a dining room 14 ft. x 14 ft., and a hall 8 ft. x 11 ft., or making a total of 480 square feet. This makes 71 carpet yards, and at a price of $2.50 a yard it amounts to $177.50.

This same space, 480 square feet, with 3/8 in. x 2 in. clear plain white oak flooring, which is the very best grade in this thickness in the plain stock, can be bought, laid, scraped and finished complete for $88. This is $89.50, or 100 per cent. less expensive than the old-fashioned carpet. There are two other grades in the plain stock that could be used that would be even more economical than the clear stock. If 13/16 in. thickness clear plain white or red is used about 30 per cent. more will cover the cost. This thickness is used chiefly in new buildings, whereas the 3/8 in. thickness is used extensively for remodelling old houses that have old pine floors.

The prices of the carpet and oak flooring were based at Cincinnati, and were offered by a reputable department store and floor layer.

Profitable Winter Work

During the slack season or winter months, 3/8 in. thickness oak flooring offers an excellent opportunity for carpenters and builders for laying in old homes where old pine floors are in use. Some canvassing is necessary to secure jobs, but when the work is started the entire neighborhood soon hears about it. A few floors laid in any neighborhood will bring about an abundant supply of jobs. 3/8 in. oak flooring can be laid in a room without disturbing any of the woodwork except the quarter round at the baseboard, and one room at a time can be laid and completely finished without disturbing the occupants to any great degree. Carpenters taking up this class of work should have complete information in regard to the different kinds and faces of oak flooring, as well as the proper methods of laying the floor, prices from the retail lumber dealer for the stock, nails, etc. A good reputation for first-class work is soon paraded and results in increased business. There has been many a carpenter during the last few years who has taken up this line of work as a sideline, and who has developed into a specialist of laying oak floors in new homes, as well as remodeling and improving old homes by use of 3/8 in. oak flooring.

The manufacturers of oak flooring have books and folders imparting full information on how to lay oak floors, as well as the filling and finishing in varnish or wax. These books or folders are generally distributed by the manufacturers to all the retail lumber dealers, and they in turn generally carry a supply for the free use of anyone who desires them.

Getting the Coin—The Test for a Yard Manager is his Ability to Collect

The September issue of the Mac's Maggie Zeen, the house organ published by the Shevlin, Carpenter & Clarke Company's retail interests, is devoted largely to the subject of collections. Discussing this problem the editors in their introduction have this to say:

"We are planning to make a better cleanup this year than ever before. Primarily, because of the unsettled condition of the business world. Secondarily, because of the great increase in investment caused by the high prices of our stock of merchandise; and thirdly, because we have been too lax in this respect in past years and must get away from this enormous investment of capital in book accounts and notes.

"The real test of business ability in a yard manager will be found not in selling, but in accounting, not in care of stock, but in collecting. It takes a good fellow to sell goods. It takes a methodical, careful man to be a successful accountant. It takes a worker to keep the stock in good condition. It takes a combination of all these with the added qualities of a diplomat, attorney and prize-fighter to make a real collector.

"If we were called upon to design a coat of arms for a collector we would suggest a slung shot and brass knuckles rampant upon a field of soft soap with the motto 'I persist,' for persistance is the greatest stock in trade of the successful collector. One of our star collectors—we are not going to mention any names, but for your information will say he is a widower who sleeps at the office in the summer time—says he always likes to ask a man for settlement every time he sees him. He doesn't care to set a definite date of payment because he might meet up with his victim before the due date arrived and it would physic him not to be able to jar that man up. This man has been known to ask a debtor to settle three times in one day and receive the same number of refusals, but this did not deter him from

going over to that man's house before breakfast the following morning to seek whether or not he had changed his mind over-night. This persistent insistence has educated the people of the community to pay him first, and while they know their credit is good with the company at this point, they also realize that they have an obligation to meet and prepare to meet it when it falls due."

The Time to Collect

In another article, they say:—"When you start to make a debtor toe the scratch, make him toe it square—don't compromise—don't dally—bring him into camp. You make an enemy, if you weaken; a friend, if you don't.

"Conditions are unusual this year. In part of our territory, the crop is exceptionally good. In other parts, it is exceptionally poor. In both cases, we are urging a strenuous collection campaign. Where the crops are good, it is our big opportunity to clean up some of the old notes we have been renewing from year to year. As this may be the last big crop for several years at some of our points, it is our golden opportunity to cash in. Many of our stations should make a complete clean-up this year, not only of successful accounts but notes as well. The man who will not pay his bills now must be forced to do so.

"When the crops are poor, it will be necessary for us to go after our collections harder than ever. The loss of this year's crop may put into the doubtful class the man who owes you. Be on the job first and you will not be the one who will have to wait. It is the man who is persistent who gets his money first and when the debt is paid, you stand a much better chance of getting his business. If a man is good, let him get a loan from the bank, we are not in the loan business.

Good Collections Win Business

"Why do good collections win business? Because a man who keeps his account paid up feels a certain satisfaction in dealing with that concern. He feels quite rightly that he is a privileged person and always welcome. If he lets the account lag, his conscience may haunt him and he is greatly tempted to go elsewhere for his lumber until his account is paid.

"But, you may ask, how can I speed up collections? By going after them in a systematic manner. Sending a man a statement the first of the month and then forgetting about the debt for another month is not collecting, and you will be a long time getting the money from many of your customers if you follow this plan."

Forms for Collection Letters

For the use of their agents they have included some form letters to be sent out at periodical intervals.

In concluding, some rules and regulations are given which, it is stated, if enforced, will go a long way toward reducing loss from bad debts. They are as follows:

"1st. Securing a distinct understanding of terms and limits.
"2nd. Handling customers according to their individual situations.
"3rd. Co-operation with fellow merchants.
"4th. Making collections promptly.
"5th. Being impartial.
"6th. Securing new accounts on the basis of additional convenience, instead of the unusual ease with which goods may be purchased.

A Few Proverbs

"What doth it profit a man to do fifty thousand dollars' worth of business if he loses five thousand in bad accounts"?

"A fair and firm credit policy never lost a business house any great amount of worth while trade. On the contrary, it has been one of the best means of building up trade."

"A sale is loss till money is collected."

"It takes a lot of hustling to make things go, but hustling is good for us."

"When some people make a payment on account it is on account of wanting more credit."

"As between the fellow who says too little and the fellow who says too much—more parrots have their necks wrung than owls."

"The consumer with which you deal is essentially honest and if you serve him well he will pay you."

"The man who wants to have his own faults hidden is usually known by his loud complaints of the faults of others."

United States Commandeers Southern Timber

Admiral W. C. Capps, general manager of the United States Emergency Fleet Corporation, has issued a decree to all sawmill manufacturers in Georgia-Florida Saw Mill Association territory requiring that the manufacturers place at the disposal of the United States Shipping Board's Emergency Fleet Corporation every stick of their manufactured product in sizes of 12 x 12 inches or larger by 24 feet feet or longer, or any sizes 30 feet or longer, and deliver the same, or parts thereof, in such quantities and at such times, and to such persons, as may be specified.

Cost Accounting for the Wholesaler

System that has Proved Its Merits Described by a Wholesale Lumber Manager—All Information Readily Available

I have been patiently waiting for an article on a good, practical cost system that could be used in a wholesale yard, and as I find that the majority of systems outlined by the different magazines are practical only when used in a retail yard, I decided to explain the following system, that has really proved its merit with us.

At the end of each day, week, or month we know exactly how much money we have made, not only an aggregate net profit, but how much we have made on each particular order we have filled, and this same system shows us very plainly which of our purchases are the best, which grades produce the highest profit, and at the same time keeps an indexed file showing exactly who are our customers for each particular grade and thickness, so that when we want to move a certain lot of any one grade we can write to or call on the people who use that grade, and not waste time or patience with customers who use some other grade.

We take an inventory every three months, and the fact that our inventory has agreed with our books in every case shows that we are on the right track. The first step, and the only complicated one, is to arrange a card indexed inventory. It is then necessary to arrive at the actual cost, in the pile, of each of the different items carried. This can be done by extending the amounts of the different items at the present market price, and by the comparison of this result and your lumber account decide as to how much you will have to add to or subtract from these estimated cost figures to make your yard inventory the exact equal of the lumber account, allowing for a 1 per cent. difference either way. Of course, the number of feet, kind of lumber, grade, thickness, location of pile, dryness, and this actual cost price are placed on each separate pile and card.

Completed 7/10 1917 Signed Hall Foreman
Inspected by Jarden
Shipped on Order No. 7460

Fig. 3—Work order form, 5x8 inches gross, less about 1¼ inches for binding margin; printed on manila tag stock

For example a card would read:

8/9 20,000 ft. 1x6 No. 1 Barn dry 3 months—pile No. 24—alley 6—$40.

This $40 to us would mean the actual buying price plus freight to our yard plus unloading and sorting, plus the piling charges; in other words, $40 is the cost in our piles at Port Huron.

Now one extra card is made out, a balance card, divided in two parts; one part for cars figuring out below our actual cost on stock already in the yard, and one part for stock figuring above this cost. It will be found that unless you are buying on a very changeable market, or have made some extra poor buys, the good and bad side of this card will just about balance at the end of each month.

On the receipt of a car extend each item at your indexed price; deduct this result from your total invoice, plus freight, plus handling and inspection charges, or vice versa. Add each item to the amount showing on its respective card, and place your balance or shortage in dollars and cents, if any, on your balance card. For example, you buy a car of 19,594 feet of 1 x 12 No. 3 and better at $34 f.o.b. a point taking a 20-cent rate to your mill.

Your invoice is	$666.20
Freight, 47,000 pounds at 20 cents	94.00
Sorting, piling, unloading	19.59
Total cost in pile	$779.79

The car develops the following grades that are indexed at the prices placed after them:

14 ft. shaky clear	$40.00	$ .56
1,566 ft. No. 1 dressing	50.00	78.30
2,678 ft. No. 1 barn	45.00	120.51
13,090 ft. No. 2 barn	37.00	484.33
2,120 ft. No. 3 barn	32.00	67.84
126 ft. No. 1 box	29.00	3.65
Total cost according to indexed price		$755.19
Actual cost in pile		$779.79
Cost based on indexed figures		755.19
Balance credit		$ 24.00

Balance to be held until the end of month and absorbed in grades developing in this car or counterbalanced by a car that figiures out with a balance to the good. If, at the end of the month, your balance card does not balance, you can see at a glance which grades are to blame, and, by looking up your stock of those grades, raise or reduce their price per thousand so that you can absorb the difference in your inventory.

At the end of each day the lumber sold from your different piles is deducted from that pile and the purchased lumber added to the pile. Mr. Miller's inventory system explains all this. The name of the customer is placed on the card opposite the number of feet and grade he has bought.

The cost figures from your different cards are placed before the number of feet on a copy of your invoice and extended so that each invoice will show the cost and selling price of each item sold. If you have a planing mill, it will be allowed so much per thousand for each different kind of work it does, and the planing mill credit and freight charges will also be placed on the copy of invoice.

Card Number One

At the top we have printed "Rough" and "Dressed," so that either one can be stratched out, and the correct definition of the lumber left. The first line on this card shows that on May 7 we had 25,000 feet. On May 9 car No. 10672, containing 10,000 feet, arrived in the yard under order No. 7460, billed to us by John Doe. This 10,000 feet was added to the 25,000 feet, leaving a total on May 9 of 35,000 feet. On June 1 we sold the John Adams Lumber Company 15,000 feet at $52, our order No. 7510, ticket No. 743. The lumber was S2S&T&G. This 15,000 feet was deducted from the 35,000 feet, leaving a total of 20,000 feet on June 1; and so on with the other purchases and sales.

It must be understood, however, that not all of these purchases were bought at the same price. Possibly one car was bought at $38, another at $40, and another at $42.

Card Number Two, Balance Card

I do not feel that there is much explaining to do on this balance card. The first line shows that John Doe shipped us car No. 10672, containing 1 x 6 No. 1 barn, on July 1, and after we had extended the different items that developed in this car we found that it amounted to $40.15 more than the total invoice, plus the freight, plus the handling charges. The other side of this card shows that on July 2 the Carter Lumber Company shipped us car No. 9333, containing 1 x 10 No. 2, and after it was extended at the index price of the different items developing in the car it shows that we were $20.25 short.

Figure Number Three, Mill Order

This is nothing more than a mill order giving our mill foreman the working instructions on the car showing the order number and date, and designating the man who inspected the car. Each one of these tickets should be numbered, so that there will be no doubt of your planing mill getting credit for every piece of work that it does. The reverse side of this card shows the number of men, and the number of hours these men worked on that particular order, the rate the men get per hour, the total amount of the wages, and the number of the machine, and, of course, the number of hours the machine worked on the job and its rate per hour. You will note that the men's time figured to $9.50, making a total of $14.25. Now we have a regular list showing the prices that we allow our planing mill for the different kinds of work that it does. In this case we allowed the planing mill $1 a thousand for working this car. There was 22.000 feet in it, and therefore the wholesaler was charged with the $22 for planing mill work, and the planing mill was credited with $22 for the work it did on the order. This shows that the planing mill will make a profit of $7.75 on the work of that particular car of lumber.

Form No. 4 Invoice

This is merely an ordinary invoice, showing the date, order number, the person to whom we sold the lumber, the point to which it was delivered, the car number, and the road to which we gave the car, the number of feet, the selling price of each particular grade, the total invoice to our customer, the weight of the car extended at the rate and deducted from the total invoice, leaving as a result the exact amount in dollars and cents that the customer is to pay us for the car, in this case $964.50. The left-hand side of this invoice or copy of invoice for our regular invoice is made out from this yellow slip, and shows before each item the card indexed price per thousand of that item and the total cost extended at that price, which in this case amounts to $719. To this is added the $22 mill work charge that we must credit our mill, making a total to us of $741. After looking up our time tickets for our wholesale yard, we find that one inspector and two men worked on this order for ten hours, a total handling charge of $4.80. This is also added to the cost, making a total cost of $745.80 on the car; therefore, by deducting this $745.80 from our $964.50 we find that we have made $218.70 on this particular car. Of course, at the end of the month, the total of these profits will merely represent our gross profits, and from it we must deduct the customary office salaries, interest on investment, etc. I hope my explanation will be found understandable, and that some of your readers will be sufficiently interested to give the system a trial.—By Richards Jarden, in American Lumberman.

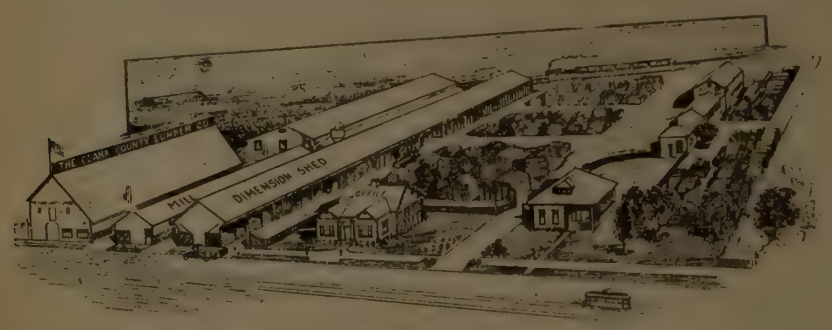
Attractive Yards Draw the Most Trade

Good Layout and Pleasant Appearance as Important to Retail Lumber Business as to Any Other—A Striking Example

During last summer I visited a number of lumber yards and planing mills that had not the ghost of a sign about the premises indicating that a lumber company was within a mile of the place, says a writer in the American Lumberman. The yards looked like lumber yards to be sure, but they might have been storage places for box factories or breakfast food bakeries. A number of times I was at a loss to know where the office was located, and several times I was not sure I had found the place I was looking for. A person hates to go into Jones' office and say "Is this Mr. Skeezick's lumber yard?" It is embarrassing.

There are some stores and hotels in the big cities that make it a practice not to display their names on the fronts. This little mannerism is really an advertising dodge on their part. They advertise so extensively in other and unusual ways that this lack of a name out



Birdseye view of Clark County Lumber Co.'s yard.

in front gives the shopper or the diner an expansive feeling of being a patron of a place so famed and so exclusive that it does not need to resort to the usual methods of publicity. But there are few lumber yards in this class. Not many of them become a household word like the Waldorf. And no great number add any to the volume of business by neglecting to put up a sign on the shed. Some people go to an absurd length in this sign business and paint the place over like a circus poster, listing all the things that are kept for sale and announcing in extravagant phrases the high quality, low prices and valuable service to be found there. Usually this is a mistake. Covering the shed with a wild delirium of advertising literature may interest the folks for a time, but it soon gets tiresome. A man rolling a peanut down the street with his nose may attract much attention the first time he does it, but if he repeated the performance day after day he would soon be suppressed as a public nuisance.

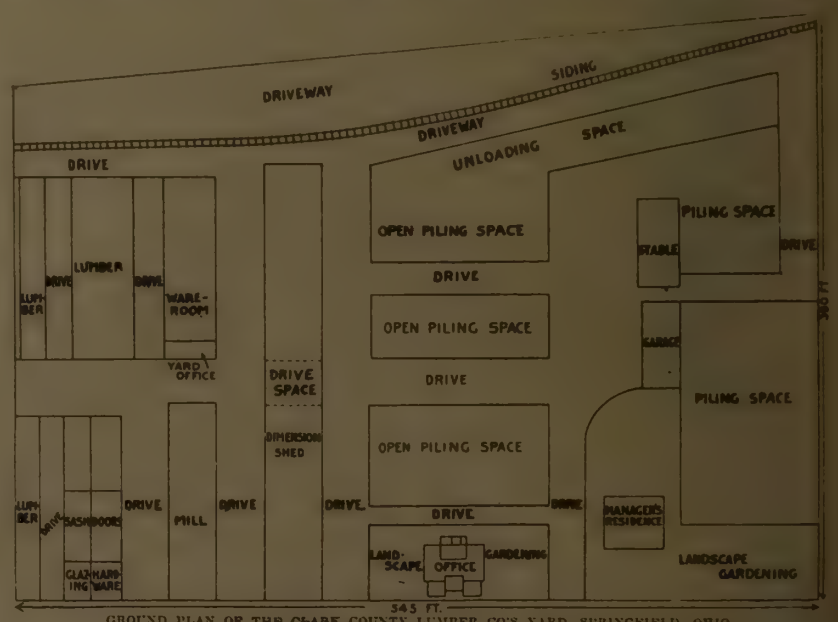
This matter of the sign on the front of the shed is a part of the general problem of the appearance the yard makes. This is rather more important than the old-fashioned lumberman thought. In that respect he has lagged far behind the medical profession. For while your sawbones considers it unethical to advertise more than to put a card in the paper, he has long been an expert at the little game of putting up a front. The Van Dyke beard that luxuriates over the map of many a young M.D. is an effort to assume the appearance of age and learning. The wild dash through town in the new car with not patient at the end of the run is an effort to create the impression of a large practice. We smile at these harmless little ways of advertising and consider them rather legitimate as well as traditional impositions on the credulity of the public. But they can not rank in the same class as legitimate and purposeful advertising with a clean and neatly painted yard front.

A man will keep his sheds and office looking well kept for the same reason that he keeps himself well groomed. Clothes do not make the man, and when we look at some of the affected poses of the men in clothing advertising it makes us almost resolve to wear hickory shirts and overalls henceforth. I saw a picture of George Washington dressed up in modern tailor's product; and I'm sure if the immortal George had ever looked the simp that the artist made him out to be he never would have lived in history. Nobody would have trusted him to post a letter. But if clothes do not make a man out of a fool they generally do indicate whether he has any sense of order and self respect. Presumably some fine fronts are backed by poor lumber yards; but a little investigation indicates that more good lumber yards are concealed behind shabby, slouchy fronts. The Lady Who Travels With Me called my attention to a sentence in a household magazine with the remark that it might apply to lumber yards. "The plainer you are," this sentence ran, "the more intelligent you must be—and the better you must dress."

Lumber yards have been pretty plain. It used to seem impossible that a business that handled such a bulky, undecorative material as lumber could possibly look attractive. This apparently has been a sort of tradition, and no one tried to change it. But it might be well to call attention to another institution that handles as unlovely a product as lumber but that has by tradition become one of the show spots of the town. This is the gasoline filling station. Most of us remember the greasy, unkempt place on the side street where gasoline used to be dispensed. But some enterprising person must have reflected that the majority of motorists are well dressed and clean and that this grease and dirt would not be a drawing card. Then people began making long drives and were compelled to have their tanks refilled in strange towns. Out of these considerations was evolved the idea of a filling station on the main street that would be a credit to its surroundings. Now you see them in every town—an attractive little house surrounded by a trim bit of turf with a gracefully curving drive leading up to the gasoline pumps. Every motorist knows when he sees such a place that there he can get gasoline and oil, and every townsman is perfectly willing that such an attractive station should occupy a prominent spot in the town.

They will be willing that a lumber yard should occupy an equally prominent spot if it looks equally attractive, as it can be made to do. We keep pounding along on this thing because we believe appearance to be important. Of course, it is not one of the prime necessities. But we all insist on a good many things that cannot be considered prime necessities. A few days ago a fat man in a hotel dining room made quite a scene because the waiter gave him a plate still slightly reminiscent of the eggs that had been eaten off it at breakfast. Now a clean plate is a pleasant thing, but it isn't an absolute necessity for the sustaining of life. It is easy to think of situations in which that man would be glad to eat out of a skillet. But none of us is going to eat off a dirty plate if that kind of doings isn't necessary; and in ordinary times a dirty plate is an evidence of laziness and a plain dullness toward the common decencies of life.

We can't say truly that a trim appearing yard with neatly cut grass and well painted sheds and a well kept office will make the difference between success and failure. There are too many other things that enter into the determining of success, and some slouchy lumbermen have become wealthy beyond the belief and experience of a common ink-slinger. But the tendency in these days is away from that sort of thing. Most business men who have endured very long have worked out the commercial details of their occupation to the



GROUND PLAN OF THE CLARK COUNTY LUMBER CO'S YARD, SPRINGFIELD, OHIO

point of passable efficiency. They know buying and stock keeping and salesmanship and collection pretty thoroughly. Of course, they are always working to improve these things. But they are also looking for opportunities to add to the general pulling power of the business; and in the retail lumber trade they are finding it in two things: attractive appearance and selling service. These two things must go together if they are to be effective. Appearance is merely an adjunct of selling service, if you discount the feeling of satisfaction and added self respect the owner has when his place is attractive looking, but it is important. If a man is to graduate from the old idea of merely keeping a stock of lumber and is to begin considering how he can help

his customers to plan better buildings he must look to his own premises. Otherwise he will be told to minister to himself before he tries to advise his neighbors.

So if we talk a good deal about selling service and general appearance it isn't because we think these are the only things worth talking about; it is because we think a good many lumbermen who are efficient in other and equally important departments ought to give considerable more attention to this.

A Concrete Example

The Clark County Lumber Company, Springfield, Ohio, has recently completed a yard that probably is one of the most modern and convenient in the State. The ground plan and the perspective drawing shown herewith will give some idea of the size and arrangement of the place. The Clark County Lumber Company numbers itself among the believers in modern equipment and in attractive appearance. The office is a separate building and planned along bungalow lines. The manager's residence is on the yard grounds, and both buildings are surrounded by lawn that has been carefully landscaped and that is well kept. A picket fence adds to the appearance of the place and also serves to protect the place from casual and uninvited guests and souvenir hunters. In this way the office is slightly set off from the yard without being removed from it to such a distance as to interfere with the true function of offices. I imagine this will have something to do with attracting a certain class of trade. Most women, even incorrigible shoppers, have an aversion to going to a lumber office. They seem to class it as a distinctly masculine hangout like a barber shop or a cigar store. But if the office is in appearance a pretty little bungalow set in a well-kept lawn they will have more courage; a small point, certainly, but not unworthy of consideration.

Each Part Must Be Accessible

Another point to be noticed is the wealth of driveways. One of the problems in arranging a large yard is to make each part accessible. In our effort to leave as much storage space as possible we are tempted to cut down on driveways; we either leave them out entirely or else make one do duty for two and then make it so narrow as to be practically useless. This yard has broad drives crisscrossing it in such a way that a wagon can go directly to practically any part of the yard. Furthermore, there is more than one way out if one important drive gets blocked up with a couple of wagons. The yard office is located at the principal focus of these drives so the yard foreman is able to keep tab on all that goes on in the place.

Stock is divided between sheds and open piling. The open piling space, presumably, is in the nature of an overflow yard. There is a dimension shed that doubtless will take care of a large part of that kind of stock. But there come times when the stock gets extra large in volume, and then there must be an overflow. The practice of piling part of the stock outside is common in Ohio and is accepted as reasonable by consumers. The dimension shed is the longest on the grounds and is made umbrella style so that stock may be taken out from either side. This shed has a drive running crossways of it in the middle. This drive is the opening between the outside piling yard and that part of the yard occupied by sheds.

The garage and stable are isolated at one side of the yard. This is advisable in every yard but not always possible. The yard has its own siding and unloading space, and many of the drives open out into the space. Like most eastern yards this one has a planing mill. This mill is of rather unusual shape, being long and narrow. The glazing and hardware rooms have show windows in front. These windows could be effective nowhere except along the street, of course, but this removes the hardware room so far from the office that it will be almost impossible to develop any casual counter trade. It may be that the company does not care for this trade and is content to sell only building hardware to be used in erecting those buildings for which it sells the lumber.

An address upon "Present and Possible Products from Canadian Woods," by Dr. John S. Bates, superintendent of the Forest Products Laboratories of Canada, which was delivered before a sectional meeting of the Canadian Society of Civil Engineers at Montreal, has been published in pamphlet form. The address contained an excellent review of the subject under discussion, including definite statistical facts and valuable information obtained after extensive investigations at the Forest Products Laboratories. Readers of the Canada Lumberman have already had an opportunity of reading much that was contained in the address, extensive extracts from which were published in a former issue.

Mr. William Rutherford is suggested by the Montreal Citizens' Association as one of the members of a governing committee to be appointed by the Lieutenant-Governor in order to ensure a better business management of the city's affairs. The association has petitioned Sir Lomer Gouin with this end in view.

Valuable Water Power
and 162 Square Miles of
Valuable Timber Limits
FOR SALE BY PUBLIC AUCTION

The limits are on the river, Mississippi Branch, a tributary of the Madawaska, and Water Power at Eganville, Ont., on the Bonnechere River. These will be offered for sale by Chas. M. Henderson & Co., Auctioneers, at their office, 128 King St. East, Toronto, Ont., on October 30th, 1917, at 2 o'clock p.m. The Limits will be offered in three parcels, as follows:

Parcel No. 1—

Comprising parts of the Townships of Mayo, Carlow, and Raglan, license covers in all 65 square miles, a great portion of which is deeded or located lands.

Parcel No. 2—

Comprising two parts of the Township of Cashel in two licenses, covering 18½ square miles, well timbered.

Parcel No. 3—

Comprising parts of the Townships of Ashby and Effingham, in all, 78½ square miles, well timbered. This parcel also includes lots 29 and 30, Con. 10, Mayo, making 100 acres (more or less), on which is located a valuable water power, known as the Big Chute, situated five miles from the terminal of the Bessemer & Barrys Bay Railway.

All this country was cut over some years ago for the pine, of which there is considerable left, along with large quantities of Birch, Maple, Ash, Elm, Hemlock, Cedar, Spruce, Balsam, and Basswood, suitable for sawlogs. also pulp wood, railway ties, and large quantities of hardwoods for chemical purposes and a great growth of young pine.

These limits are close to the Central Ontario Ry. on the West, a branch line of which runs in the Childs Iron Mine in the Township of Mayo, from L'Mable Station. They are also easily accessable from Barrys Bay, on the Grand Trunk Railway.

The Sale will be subject to all conditions and regulations of the Department of Lands, Forests & Mines, affecting same. The licenses permit the cutting of all kinds of timber, except on deeded or located land.

The reason for selling is for the purpose of closing up an Estate.

Terms of sale regarding limits: 25 per cent. of purchase money down, 25 per cent. 1st of July, 1918, balance 1st of July, 1919, bearing interest at 6 per cent. per annum. A liberal discount can be arranged for cash. Transfer of license will be made on final payment, purchaser bearing cost of transfer.

There will also be offered for sale a valuable Water Power, with a cement dam, and the stone walls of a flour mill; the latter was burned in 1911. This is in the centre of a thriving village served by the C. P. R. and G. T. R. Railways, a good manufacturing site.

Terms for the Water Power: 25 per cent. cash on day of sale, balance can be arranged.

Any further information regarding these properties will be furnished by writing the undersigned.

The properties are offered for sale subject to a reserve bid.

GEORGE B. FERGUSON,
Renfrew, Ont.
August 30th, 1917. 18-20

For Sale

About five or six tons of 5/8 and 9/16 tested chain in lengths from 27 ft. to 30 ft. with ring on one end and hook on the other end. Address Drawer "F," Sarnia, Ont. 19-t.f.

Tide-Water Stumpage
For Sale or Exchange

For sale, or will exchange for good ranch or farm land, B. C. Tide water stumpage, cruised and surveyed.

CARL BLOCK,
19-t.f. Peoria, Illinois.

Jobbers Wanted

We wish to let several contracts to take out logs on Berth No. 6, being broken front lying between the Magnetawan and French Rivers. This berth is all convenient to Canadian Northern Railway.

John Harrison & Sons Company, Limited,
Saw and Planing Mills,
9-t.f. Owen Sound, Ont.

TENDERS for Pulpwood Limit

Tenders will be received by the undersigned up to and including the seventeenth day of December next for the right to cut pulpwood and pine timber on a certain area situate in the vicinity of the Kapuskasing River in the Districts of Timiskaming and Algoma.

Tenderers are to offer a flat rate per cord for all classes of pulpwood, whether spruce or other woods. The successful tenderer shall be required to pay for the Red and White Pine on the limit a flat rate of $10 per thousand feet board measure.

The successful tenderer shall also be required to erect a mill or mills on or near the territory, and to manufacture the wood into pulp and paper in the Province of Ontario, in accordance with the terms and conditions of sale which can be had on application to the Department.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for Twenty-five Thousand Dollars ($25,000.00), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said Twenty-five Thousand Dollars ($25,000.00) will be held by the Department until such time as the terms and conditions of the agreement to be entered into have been complied with and the said mills erected, equipped and in operation. The said sum may then be applied in such amounts and at such times as the Minister of Lands, Forests and Mines may direct in payment of accounts for dues or for any other obligation due the Crown until the whole sum has been applied.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.

Toronto, September 19th, 1917.

N.B.—No unauthorized publication of this notice will be paid for. 20-24

Active Logging in B. C.

Much activity in the logging industry through British Columbia is reported by Mr. John Peck, chief provincial inspector of machinery, who recently returned from a trip through the North. In particular, large quantities of cedar, hemlock, and spruce are being cut. The pulp and paper concerns are logging a lot of hemlock for the manufacture of paper, and cull spruce is also used for that purpose, while good grades of spruce are being cut for aeroplanes. Contrary to the general opinion, Mr. Peck says there is no lack of labor for the logging camps. If any of the mills are suffering from a shortage of logs it is because of the difficulties experienced by the towing fleets all summer. There has hardly been any decent towing weather this year, he states. Tugs which ordinarily will make a certain trip in ten days have been taking a month. On the way down the coast they passed innumerable tugs, with booms of logs, stormbound.

Mr. Peck speaks enthusiastically of the modern arrangements of the logging camps operated by some of the paper people. They have, for instance, hot and cold shower baths, a room for drying the men's clothes when they come in from the woods, steel beds with spring mattresses, and, in fact, accommodation very much like that of a passenger boat.

Lake Vessels for Ocean Trade

A representative of the United States Shipping Board recently visited Cleveland, Ohio, to initiate government plans to commandeer lake freighters for coastwise and transoceanic war trade. Figures tabulated by the government agent, in conference with local shipping experts, owners, builders, and tug men, show that upwards of 80 lake vessels can be taken to salt water. The Shipping Board's decision will rest upon the report to be made by its representative. The plan is to take every vessel capable of passing through the Welland Canal, and thence through the St. Lawrence River to the Atlantic, before lake traffic is ice-bound. The Shipping Board is now making a list of ships under 260 ft. length and 43 ft. beam, which can pass through the Welland Canal without alteration. Vessels up to 520 ft. length and not more than 43 ft. beam will be cut in two, bulkheaded, and towed by tugs through the canal and river.

Band Saw Rolls

In selecting a stretcher, it is important that it be of heavy construction, and that the roll spindles do not spring when subjected to considerable pressure. The rolls should be made solid and of a good quality steel, and be carefully and accurately ground on true segments of a circle. They must also be in absolute alignment, and be properly crowned, or the result will be unsatisfactory. Cut gears should be used, and heavy rolls geared together be readily reversible in either direction, and be adjustable to any point of the saw. In the best machines a pressure gauge with index and dial is fitted.

Review of Current Trade Conditions

Ontario

The lumber trade of Ontario still shows an encouraging volume of business in progress. It is a difficult matter to place one's finger upon the actual source of trade, though it is easy enough to point to all the ordinary lines of demand during normal times and to see that they are pretty nearly non-existent to-day. Unquestionably the bulk of the business to-day is to be accounted for in one way or another by the war, which has created many new uses for lumber, some of which seem to be more or less prominent at any given time.

The shell box industry has by no means petered out as some people were inclined to think a few weeks ago. Assurances given by the Minister of Finance in the House of Commons recently that the loans to the British Government for this purpose were to be continued during the winter and probably during the balance of the war now seem to be justified by the fact that new contracts for considerable quantities of 4.5 in. and 6 in. shells are being let, and by an authoritative report that for the 6 in. shell, at least, the board will be placing contracts well into the middle of next summer. Apparently the munition business is simply being altered to some extent in its details, but not reduced in volume. If this turns out to be the case, it will mean much to the shell box business. In addition to the Ontario demand for shell box lumber, there is a strong demand for similar stocks and other war materials in the United States, and much Canadian lumber is going across the border for this purpose.

There is little or no building going on in Ontario cities, but the outlook for country trade is excellent. The farmers are getting a high price for their products, and can be counted upon to spend a good portion of their receipts upon lumber for barns and other necessary buildings, many of which have been allowed to go without repair for some years. Many new farm buildings are also necessary to enable the farmers to keep up with the intensified demand made upon them by the urgent food requirements of the war.

The lumber manufacturing situation is difficult to describe. Undoubtedly the prospect for next year's prices is that they will be higher than they are to-day. That is to say, the cost of operation and the scarcity of labor, combined with the new demand for practically everything that can be produced that is serviceable for war uses may be counted upon to keep prices strong and force them upward; always provided, of course, that no unforeseen adverse influence develops. All the conditions prevailing to-day point in the direction of scarcity and strong prices, but there are a few lumbermen who are talking about lower prices, particularly for spruce and hemlock. Such a belief can only be based at present upon conjecture, and the reasons for believing otherwise are so definite as to outweight the others greatly. Mill men, who are best able to judge the cost of operating and the probable quantity that will be taken out this winter, are talking of an advance of from $4 to $6 per thousand feet between now and next summer.

As for hemlock, there is not sufficient stock in the country to-day to warrant any decrease in prices at present, and the outlook is for a small production this winter. Spruce perhaps is a little quieter, and is the only line about which there seems to be any uncertainty. The market for lath continues quiet.

Eastern Canada

There is no important change to report in connection with prices at St. John, N.B., which still remain firm. People who are in search of stocks cannot find any considerable quantities of 1, 2, or 3 in. spruce, and such stocks as are to be had are being held at $28 to $30 for the 2 x 3, 4, 5 and 6 in. For the 2 x 8 the price asked is from $30 to $32. Spruce boards are scarce at anything under $25. Culls are bringing $15 to $17. Lumber manufacturers in New Brunswick are experiencing the same trouble in regard to the shortage of labor as manufacturers elsewhere, and report that such labor as they can obtain is at least 25 per cent. less efficient than that of a year ago. On top of this, provisions and supplies generally are costing 25 per cent. more. Laths and shingles are quiet. Local business is fair. About 7,000,000 feet of logs remain in the Fredericton booms, but may still come out if higher water comes.

There is a strong demand for shipbuilding timber at Montreal, and the stocks available are not sufficient to meet the requirements. Much difficulty is being experienced in obtaining shipments from British Columbia. All the Eastern shipbuilders are extremely busy. The shell box situation shows some improvement, new orders having been placed recently. Local trade at Montreal is very quiet. The export trade with the United States shows a fair volume of business.

The market for Eastern spruce at Boston is active and strong. Frames are being quoted as follows: 8 in. and under, $40; 9 in., $43; 10 in., $44; 11 and 12 in., $46. There is a fair demand for boards, and the supply is limited. Spruce covering boards 5 in. and up are quoted at $31 to $42, and matched spruce boards at $36 to $37. Quotations on random are very varied, but strong. Hemlock is firm at Boston, the demand being good and stocks light. The demand for boards continues strong. The hardwood trade is very quiet, most of the business being in small orders. Prices are all firm. A very quiet market prevails at Boston for shingles and lath, as dwelling house construction is light.

Great Britain

Very unsettled conditions are still reported in connection with the lumber trade of London. The commandeering of large portions of the available stock, at values much below those now being realized, is causing a lot of comment and dissaproval. Most members of the trade are of the opinion that with the increased supplies received from home grown operations, there will not be as much necessity as formerly for importing a large quantity of stock and that, therefore, the government might see its way to increase the percentage of profit permitted upon colonial imports.

The recent removal of the embargo on neutral steamers chartered under license, which are now permitted to import stocks from America, is looked upon by the trade at Liverpool as an acknowledgement of the imminence of a famine in spruce. Such a famine will, of course, affect spruce not directly held by the government, as it is quite possible for the government to replenish its stocks whenever they are much needed, by making use of controlled tonnage. There is, however, a great shortage, as is shown by the fact that many consumers are obliged to rely on the open market for their supplies, notwithstanding the fact that the timber required is for work of national importance. In view of this situation it looks as though the danger of a famine is recognized by the government and that it is inclined to do what it can to assist matters. Such concessions as have been made, however, have turned out to be of little or no value, and it is hoped that new regulations of a more favorable nature will be passed

It is generally expected that f.o.b. prices for Canadian spruce must increase, though, of course, much will depend on the action of the British Government. If continued uncertainty prevails, it seems certain that a heavy curtailment of operations in Canada can be counted upon as operators will not have any strong inducement to go into the woods. It is known that this situation has already developed and that operations this year are likely to be much reduced for this particular reason.

The labor shortage and the numerous restrictions on imports are the chief factors of the trade at Manchester. The timber trade, however, is fairly brisk and, of course, requirements are considerably greater than available supplies. There is a great scarcity of pitch pine at Manchester, and the demand for it is very strong. Such arrivals as have been reported recently have been almost entirely on government account.

United States

An important effect is likely to be had on the market for Southern yellow pine by the recent commandeering of all longleaf yellow pine 12 in. x 12 in. and larger, 24 ft. and longer, or any sizes in 30 ft. or longer. The demand for timber cutting bills has been exceptionally active and prices have advanced. Railroad companies are still taking large quantities of lumber for car-building material, and it is expected that this demand will continue strong. Unfortunately, most of the timbers required by the railroads are purchased in smaller sizes than those commandeered by the government. Southeastern sawmills are engaged almost entirely on government business, and are rather plased with the light demand from the retail trade. The demand from all quarters except from the retailer is good. Regular fall business is a little behindhand, but a slight increase in the volume of orders placed is shown by the latest reports. There is a good demand for flooring, ceiling, drop siding, and similar lines. Ever since the middle of April shipments of Southern pine have exceeded production, frequently by large margins. Orders have not been equal to shipments, but have been in excess of production. Stocks in manufacturers hands are now below normal, and unshipped orders on hand are above normal. The car supply is commencing to tighten up.

The demand for North Carolina pine has been increasing gradually since the beginning of September, and there is a satisfactory vol-

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

ume of orders now in manufacturers' hands. The government's requirements in this line have been extensive, and are expected to continue for some time. The better grades of rough North Carolina pine have not been selling extensively of late, and stocks at the mills have accumulated. Manufacturers, however, seem to be content to hold rather than make concessions. The outlook for fall business is thought to be good.

Plenty of orders are reported by the Western pine manufacturers, and prices are very firm. Production and shipments are both being curtailed by the shortage of labor. Shipments, however, have reached a good total, and are considerably higher than they were a year ago. Shipments to Atlantic Coast and interior Eastern and Middle Western points have shown large gains.

Many of the Douglas fir mills have resumed operations on a ten-hour basis, and all of them are expected to be operating very shortly. Labor is scarce for the Douglas fir mills and high wages are being paid. Many of the mills are giving $3.50 for common labor. Naturally, therefore, prices are holding firm.

In the white pine list the lower grades are most active. There is not much movement in shop or selects. The demand for pattern stock is good. Manufacturers' stocks are small and considerably broken. Box factories are taking all the white pine available that is suitable for their work. Prices throughout the white list are firm. The hemlock market is active, sales still being in excess of production, and prices steady. The government is buying a lot of hemlock from the North, and will probably continue to do so for some weeks yet. Eastern box makers are also using large quantities of hemlock, and factory buildings are another good source of demand. Prices continue firm.

The government demand for hardwoods continues strong, and is making up for the reduced demand for interior trim, millwork, and flooring, as well as the quiet retail trade. Oak is fairly active, but prices seem to have been shaded slightly of late. The sales of gum are increasing slightly. It is expected that the standardizing of the government's requirements for hardwoods for boxes will result in a good demand for suitable lines.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Markets—Prices Firm

St. John, N.B., Oct. 8.—(Special to the Canada Lumberman.)—Conditions at St. John show little change in so far as prices are concerned. They still remain very firm and, if anything, are even better than two weeks ago. If one goes out to purchase stocks, neither spruce 1, 2 or 3 inch can be found in any quantities, and anyone having them is asking for 2 x 3, 4, 5 and 6 inches at least $28 to $30; 2 x 8 and up, $30 to $32. Spruce boards are impossible to find at less than $25, with very few at this price. Culls are as bad as merchantable, being almost impossible to find, and $15 to $17 is being asked and received. While these prices seem high, one turns to the other side of the question and finds, first of all, very little labor for the woods, and that at twice last year's prices, with provisions at least 25 per cent. higher, and everyone is hesitating whether to go in the woods at all. Jobbers do not want to go to the woods under contract, even though they are offered logging prices and conditions never before heard of. Therefore, the buyer must not judge the manufacturer by the prices. It is to-day taking 25 per cent. more men to do the same work as done a year ago, and the manufacturer does not know where or how he will get his raw material for next year or what its cost will be. His only hope of getting a profit is based on the stock he now offers for sale.

Laths and shingles remain unchanged.

Local business is still fair, but not so good as two weeks ago.

Labor conditions are not improving, and, with the winter season fast approaching, it is bound to be scarcer.

All logs on booms at Fredericton are not yet rafted, being held up by extreme low water in the river. Unless a raise comes soon some logs must be wintered there, which is a very dangerous proceeding. Should water come soon, a clean-up can be made, as not over seven million feet now remain to be rafted.

Ottawa Firms Not Receiving New Shell Box Orders

Ottawa, Oct. 12.—(Special to the Canada Lumberman.)—There has not been any great change in the Ottawa lumber market since the last report. The shell box situation commanded the principal attention of the manufacturers during the past two weeks. Ottawa lumber plants which formerly manufactured shell boxes state that the Imperial Munitions Board has recently allotted new contracts at very low prices. The trade at Ottawa believes that the majority of the new contracts went to Montreal and Northern Ontario plants. The new contracts are for two grades of boxes—the 6 in. and 4.5 in.

None of the Ottawa plants, so far as the Canada Lumberman could learn, had yet received new contracts from the Imperial Munitions Board. The Canada Lumberman has been reliably informed that the manufacture of shell boxes will not entirely cease, but will be cut down, and that possibly contracts for only two of the four grades of boxes formerly made will be let in future. Ottawa woodworking plants failing to secure new contracts have almost entirely ceased the manufacture of shell boxes. The W. C. Edwards Company, during the past two weeks, has been completing an old contract for shell boxes. The estate of James Davidson and the McAuliffe-Davis Lumber Company have entirely ceased manufacturing shell boxes.

Notwithstanding the shell box situation, the market has a noticeable tendency toward firmness. Manufacturers' prices showed no change since the last report. The spruce market is reported as being firm, with the prospect of remaining so, with shell box manufacturing in Canada being continued.

With some of the lumber plants business is beginning to pick up, as compared with the closing period of September. A small amount of new business is beginning to filter through. Shipments during October two weeks have not been heavy, though showing an advance over the period of September 15 to 30. Old business is keeping up fairly well on the whole.

The quantity of lumber in the mill yards is probably larger than at the corresponding period of last year. The mills have sold practically all this stock, but it has not been moved, first owing to lack of transportation facilities and, secondly, because it is not yet dry enough. Building operations are continuing on only a small scale, hence the demand for lumber in this regard is small.

Moderate Activity at Montreal—Ship Timbers Scarce

Montreal, Oct. 8.—(Special to the Canada Lumberman.)—The one prominent feature of the market is the pronounced demand for timber for shipbuilding. Enquiries of this description are being freely received, the demand being in excess of the supply. Advices from British Columbia state that the mills are swamped with orders, and that price has very little bearing on the situation. As a matter of fact, quotations have recently had a still further advance, and even these are dependent upon acceptance by telegraph. The shipbuilders are exceedingly busy, both on home and government account, some boats being for purely cargo purposes and others for war purposes.

There is a slight improvement in shell box lumber, due to a few more orders having been placed. This source of buying recently indicated signs of lagging. It is also reported that the British Government are in the market for further supplies of shooks.

The hardwood section is slow, furniture and piano factories being rather quiet. The requirements for building are of trivial amount.

Locally little is doing. The building season has not been satisfactory, the permits showing declines for the last few months. Notwithstanding a shortage in houses and flats, there has been no decided inclination to meet the demand, this being due to the high cost of labor and materials. During September the permits totalled $250,958, an increase of $45,502. For the nine months the value was $3,852,665, a decrease of $65,655.

Wholesalers report a fairly good business with the United States, although it is held up in one or two directions by railway embargoes.

The labor situation in the province is far from satisfactory. Advices received from lumber centres refer to the difficulty of obtaining adequate supplies of men and, what is of equal importance, competent help. The men are not only demanding high wages, but are adopting an independent attitude. Naturally, lumber firms are desirous of getting all the labor possible, and, under the stress of competition, have to hire men who are not up to standard, thus increasing the cost of getting out the logs.

After a spurt, exports to the United Kingdom have fallen away, and it looks as if the season is practicaly at an end. A little lumber has gone to South Africa, but it is stated that the British Government recently decided not to issue any further permits for the latter country. One of the exporters has sent a fair quantity of lumber to the Old Country via New York.

KLIM
SPELL IT BACKWARD
PURE SEPARATED MILK
IN POWDER FORM
FOR ALL COOKING
WHERE MILK IS NEEDED

"Food must be conserved"

KLIM
SPELL IT BACKWARD
PURE SEPARATED MILK
IN POWDER FORM
FOR ALL COOKING
WHERE MILK IS NEEDED

Are You Practising Practical Economy in the Camp?

The whole world is facing a shortage of food—everyone must do all they can to economize and conserve the available food supply.

One practical way of eliminating all of the waste of one important food—milk—is by using KLIM in all cooking where milk is needed. Klim is the solids of separated and pasteurized milk reduced to powder form. KLIM does not freeze, spoil, sour or permit of any waste.

More economical than other forms of milk for cooking and general camp use.

Labor Renewals Always Expensive

Larger Employers Learning Importance of Greater Effort to Improve Efficiency by Reducing Dismissals

By J. W. MacMillan*

It is only within the last few years that the discovery has been made that the renewal of the labor supply in industries is an expensive thing.

Students of social conditions had seen plainly enough that the seasonal occupations were costly affairs for any community. The intervals of activity and idleness of the casual laborer were regarded as one of the prime problems of society. But the cost was assessed altogether upon either the laborer himself or society at large. It was not recognized that the employer of the intermittent labor was a loser as well. Much less was it recognized that the constant inflow and outlet of employees in all occupations was a great and largely needless drain upon the financial resources of a factory or shop. Many a denunciation of the employer's heedlessness of human welfare was based upon the belief that the care and replacing of machinery cost something, while the care and replacing of men cost nothing. It was supposed that the worker might be sucked dry, worn out, smashed to bits, kicked out, thrown on the scrap heap, without any interference with profits.

The employer also took the same view. When there was a crowd of unemployed at his gate he held that the labor conditions were favorable. Could he not, then, at once fire any man and immediately hire another in his place? The machine was geared to a certain speed. and the activity and capacity of the man who tended it was accordingly guaranteed. One large employer of labor in Philadelphia was quoted as saying: "We are not interested in problems of personnel. We have a lot of work, but there are always more people to do it than there is work; and if those we have do not wish to work under our conditions, they can go, and we will go out and get others."

The Discovery

The discovery appears to date from a study of employment problems made by Magnus W. Alexander, of the General Electric Company of the United States of America, made in 1913. In that year one motor manufacturing company hired 54,000 men to keep 13,000 jobs filled. In twelve factories making machine and metal products, in that same year, whose labor force increased during the year from 37,274 to 43,971, there were hired 42,571 men. That is a labor turnover of 100 per cent. After a careful study of the different elements of cost in this process of replacing of labor, Mr. Alexander came to the conclusion that the average cost of hiring and firing a man was between $35 and $40.

A similar scrutiny of the same process was made during the following year by W. A. Grieves, of the Jeffery Manufacturing Company, of Columbus, Ohio. He found that twenty representative factories whom he interrogated took on 69,000 new men during that year to keep a labor force of 44,000 intact. His estimate of the average cost of hiring and firing a man was almost the same as that of Mr. Alexander. He made it $40.

Other executives of big businesses have expressed the opinion that these figures are rather under than over the average for the entire United States. Some do not hesitate to put the average cost of hiring and firing a man at as high a figure as $100. And they say that the average labor turnover for the whole country is not less than 200 per cent.

Pursuing the subject a little farther, Mr. Alexander came to the conclusion that more than half of the new 42,571 employees hired by the twelve factories he investigated had been needlessly hired, at an expense to the factories of $831,000. Mr. Grieves, for the twenty factories of his survey, placed the unnecessary cost at $1,760,000.

Employment Managers

These and similar disclosures made a great impression on the more intelligent manufacturers of the United States. Doubtless the recent scarcity of labor has heightened that impression. One consequence was a gathering in Philadelphia several weeks ago of several hundred "employment managers." This is the new official which the revelations of Messrs. Alexander and Grieves had called into being.

Formerly the duty of hiring and firing men had been left to the foreman of departments. It was at once seen that foremen are not the right officials for this duty, for foremen are a class of superior work whose capacity lies in their technical knowledge and their ability to maintain the output. They are not experts in employment matters. Moreover, their legitimate duties in their department are seriously interfered with by their time being taken up in engaging and dismissing the men under them. One executive who had adopted the new plan said recently:

"One of the first benefits we derived was in freeing the foremen from the daily necessity of looking over men they needed at the factory door. Under the old system the first hour of each morning and the most critical hour from a departmental standpoint was signalized by the absence of the foremen from their departments. The new system automatically changed this, and foremen were free to supervise work in their own departments, rather than lose hours daily in interviewing applicants for work."

Thus each big industry is getting to have its own employment bureau, an expert and efficient department in charge of this one important function, and resulting in the saving of many dollars in the course of the year. So far as these new bureaus have succeeded in organizing their work they have laid down three lines upon which they work, each of which means something for human welfare as well as for profits.

1. First, the securing of labor from recognized labor markets, rather than from the waiting crowd at the gate. This is a business-like and rational method which stands in sharp contract with the old, unregulated, hit-or-miss fashion of former times. It is bound to produce employment agencies of a better class than have been common, and may lead to a better relation between capital and labor through a new use being found for the trades unions.

The Round Peg in the Square Hole

2. Then comes the fitting of men and fitting them to their jobs. When the foremen did the hiring and firing the laborer was tried in only one department. If he proved a round peg in a square hole there, out he went. Under the new system he is apt to get a second chance in another department, where he may make good. Under the new system the foreman has no power to discharge. He refers the unsatisfactory workman back to the employment bureau with a statement of his reasons for considering him unsuited to his department. The employment manager then studies his case, with a view to saving the forty dollars or more which the firm stand to lose by the man's discharge, tries him out in some other place, and only fires him when it has become plain that he is hopeless.

3. The most important of all the functions of the employment bureau is the third, which consists in fitting the jobs of the men. The factory is as human as its staff, and is as likely to require consideration and mending. Thus has arisen what has been called "the new profession of handling men." For it has been discovered that the high labor turnover is not exclusively due to the discharge of the incompetent man. It is also due to voluntary leaving of competent ones. Thus it has come to be recognized as good business not to allow any man to leave without an enquiry into his reasons for leaving. A common device is to make a rule that the signature of the employment manager must be secured before he draws his last pay. This provides for a face-to-face interview between the employment manager and the man who is leaving. One of the members of the recent conference in Philadelphia stated his experience thus:

"When the men quit or are discharged they have no reason for withholding information. Complaints are heard of nagging foremen, lost time in waiting for work, and other complaints bearing on shop efficiency. These are investigated, and if the fault is with us it is remedied.

The Weakness of the Foreman

"These complaints bring to light the weaknesses of foremen. One of our best foremen had always a 'chip on his shoulder,' and approached his men with that attitude. He caused a great deal of friction before the fault was discovered. A talk with our superintendent convinced him that, while that attitude may have been all right ten years ago, it can't be done—not now.

"Another case: A man quit, and, on being asked for reasons, stated that he had to lose too much time waiting for one indispensable tool and for material for his work. Likewise he was advised that his work was O.K. by one inspector, only to finish it up and have half a day's work thrown back by another inspector. An investigation proved that the man was justified; the case was settled, and the man is still with us. As this man was an experienced hand it would have cost us $100 to break in a new man. It looks as though this was a fair day's work."

While the immediate and compelling motive in this movement is the desire for a lower cost of production and consequent increased profits, it is quite plain that these employment managers and the exetives who have employed them are well pleased that it means also better treatment for the working force. Every discovery that the interests of capital and labor are identical means so much more harmony, so much more promise that the great economic battle of the present day may reach a peaceful settlement.

During the past fifty years forest fires in British Columbia have destroyed an amount of timber approximately twice as great as that now standing in the province, or approximately equivalent to the total stand of saw timber in the entire Dominion.

Tea for the Camp

The question of tea is getting to be an interesting one, for with the advancing prices it is now very difficult to procure a quality of tea which will suit the men, and at the same time at a moderate cost. In this connection we have to advise you that we are fortunate in having a quantity of low priced kinds on hand, and have evolved therefrom a blend of Mixed Tea, which is a splendid drinker, having a full body along with a measure of flavour. We are able to let you have this extra value, packed in hundred pound chests, at twenty-two cents.

Mutual Interests of Mill and Retailer

Conditions That Have Kept Them Apart in the Past—Unity of Purpose Necessary in Promoting Development of Trade Ideals

Edward Hines, of Chicago, one of the most successful lumbermen in the United States, and one of its most eloquent speakers, excelled himself in an address which he delivered recently at the first annual meeting of the National Retail Lumber Dealers' Association, Chicago. He devoted his attention to the lack of unity between mills and retailers, and how to overcome it. The subject is one that lies peculiarly close to his heart, as well as to his business interests, and he dealt with it in a thoroughly convincing manner. After his preliminary remarks, Mr. Hines said:

The absence of complete unity and harmony between the manufacturer of lumber and the retail lumber dealer may be attributed to obviously apparent reasons, none of which can withstand the light of logic. In all my experience I may truthfully say that, notwithstanding a lack of better understanding between these two branches of our industry, I have never perceived any motive displayed that was purposely designed to frustrate efforts to make progress or advance its interests. Ignorance, indifference, and sometimes selfishness have been factors that have frequently interrupted a more harmonious feeling, but I ascribe whatever of discord there may have been to a lack of understanding of the exigencies of each branch of the industry. That there has not been greater sympathy and forbearance always is due to an increasingly inherent need for closer attention to the details of business generally and a lack of vision and perspective.

The problems of the manufacturer have not always received enough consideration from the retail lumber dealers. I say this in all kindness and without rancor, for, as I have previously stated, much of the lack of a closer relationship has come about through tendencies to adhere too closely to the single idea of buying and selling without observation of the conditions that affect the industry in a big way, and oblivious of the opportunity for comprehending a larger scope of its great operations. The relationship that exists to-day is not unfriendly, but it is not one of sympathetic interestedness. Too much reliance is placed upon individualism and rejecting too readily the dominant factors that have contributed so largely toward the success for marketing of numerous articles of commerce that have everywhere and in every way surpassed us in constructive effort. Let us take for example the manufacture and marketing of steel and kindred products. Differing only in the method of distribution, the principles concerned are not dissimilar, especially as they pertain to the manufacture of the various articles. From the moment the raw material is converted to the sizes and dimensions of the finished product required for the numerous purposes for which these useful products are made there is a spirit of co-operation between manufacturer and distributor that stimulates good feeling and welds the interests of each into one harmonious unity. Sordid tendencies and inclinations are largely absorbed and overcome by a broader and more liberal consideration of the fundamental needs of each branch of the undertaking. Manifestations of a keener regard for the welfare of each is apparent, and quality is more a factor in the sales argument than the price. True, the manufacturer of steel and allied interests are of lesser numbers and therefore more easily and better organized than are the manufacturers of lumber. The latter have been confronted for years, and still must contend with a diversity of conditions not approached, I believe, by any other industry. These various elements are less susceptible to natural restraint or control than are those controlling other products, but they are not impossible of better arrangement.

The Remedy Must Be Found

Proceeding upon the hypothesis that there exists a need for a better understanding between the manufacturer of lumber and the retail lumber dealer, to the end that their mutual interests may be more satisfactorily and more profitably served, the remedy must be found if we pursue the subject to its logical conclusion. We have all rested upon a too smug confidence in the superiority of our product as a utility in the world's commerce, with the result that the insidious growth of demand for substitues has been overlooked and unobserved, until its development has assumed such alarming proportions that we have been rudely awakened from our lethargy. The abstract goodness or utility of a thing does not measure its worth. Goodness or utility is multiplied as it is conveyed. An insignificant utensil used by many is a greater good than a superb article that is never brought into general use. Our product may be infinitely superior in every respect to some of the substitutes that have supplanted it, but failure to perceive the advantages of safeguarding our interests, a result of too indifferent and loose selling methods has narrowed the circle of distribution, and accordingly restricted the use of lumber many times, to the disadvantage of the consumer. From my viewpoint the manufacturer and the retail dealer are equally culpable in their lack of initiative and aptitude for acquiring knowledge that is essential to a better selling effort. It is the sales end of our business that has languished and needs greater intensive effort. In this day of advanced ideas who shall say that the educational methods employed by manufacturers of and dealers in other commodities have far surpassed and outranked our own obsolete ways of marketing our product. It is in this department that I have found the greatest need for action, and in which I place my greatest reliance for the unfication and co-ordination of our interests.

The world to-day recognizes salesmanship as an art and a profession. The biggest prizes with which success can lure men go to the seller. Upon him depend thousands and thousands of faithful, conscientious workers who lack initiative, and the populace at large which needs to be lifted out of indifference and an adherence to the old and worn to new methods, applications, and objects. The discoveries of the centuries, upon which we look with pride, are not only the work of the inventive mind, fired with the flame of genius, but are the reflex results of the world's demands. Sellers as much as inventors stand behind them. It is not merely the porsonality of the seller which makes things happen, but the selling quality in him that surges beyond him, and we read him in the street cars, we see him coaxing from the shop windows, he beckons us from fence and billboard, in the newspaper and daily mail, and we see the night sky electrically flooded with him.

The standard of excellence in selling is high. All positions in the world which are recognized and honored have had to make their ascent against public antagonism. In exact ratio to the stubbornness of the fight the apparent insurmountableness of the opposition is the glory of the place achieved and the world's homage to the conqueror.

Power in its many forms dormant in men awakens under attrition, and opposition on the one hand and the urge of enthusiasm and inspiration on the other. Nothing great comes from opposition alone, nor from enthusiasm only. Achievement has paid its price in the overcoming of obstacles; in unwavering aligning accomplishment with inspiration. The daring of the human mind is the generative principle of progress. The achiever overcomes inertia and compels opposition to serve his desire.

Measuring difficulties is one of the most difficult tasks mankind is compelled to perform. Scientists told Napoleon it would be impossible to cross the Alps. They proved it theoretically. "There shall be no Alps," was the unqualified answer which will live as an inspiration for all time. And the spirit that answered thus was the spirit that crossed the Alps. When Grant first proposed the siege of Vicksburgh, Sherman, who was theoretically one the greatest tactitians in the war of the rebellion, counselled against it, and demonstrated to Grant on paper the utter futility of such a movement. Events proved that Grant was right. He had measured the difficulties, and, contrary to every known strategy of war, he surmounted them and Vicksburgh fell.

In measuring the difficulties that have heretofore prevented a better understanding of the objects the lumber industry must attain I feel sanguine that whatever of misunderstanding there has been apparent has been due to the obscurity of the points at issue rather than to any hostility on the part of the retail lumber dealer. I have said, too, that I was convinced that whatever of indifference or opposition there may have been shown in the past was not from design or motive. It is due almost entirely to a lack of understanding of the essential needs of each and how best to proceed to repair them. The retail lumber yard should represent in its best aspects the connecting link between the manufacturer and the consumer of lumber. It should serve with profit to itself, and with satisfaction to the manufacturer, as the distributing agency for forest products with relation to the kinds and character of lumber that may be available, in reasonable proportion to the production. Lumber that is always in short supply with the manufacturer should be intelligently conserved, and that which is usually in average or surplus supply should be sold according to present-day standards of selling. Prospective buyers should be made acquainted with the good points of the particular kind of lumber offered. Many times these particular surplus items may be substituted for stock that comes slowly from a sawlog, and accordingly at greater cost of production and with equally less facility. The consumer is not usually conversant with the practices and customs of the lumber business. He must, therefore, be educated to know kinds and qualities. His interest must be aroused and his suspicions converted to confidence and a feeling of security. The virtues of wood generally should be practically demonstrated. The relative merits of certain kinds of lumber for

specific purposes should be honestly and conscientiously presented. Where it is obviously impractical to use wood for a given requirement by no means should the use of wood be urged. On the contrary, whatever material is avowedly better for the purpose should be offered and sold.

Closer Business Relationship Required

The splendid possibilities for negotiating and maintaining a closer relationship between the manufacturer and retail lumber dealer cannot be too seriously considered. In the modern intercourse of business the remoteness of the manufacturer of lumber from the ultimate consumer renders the position of the retail dealer well nigh indispensable as a means of distributing lumber. The retail dealer should occupy very much the same position in the trade as the drug store that ministers to the wants of the populace, selling its service along with its merchandise. It should conduct a vigorous and an intelligent advertising and publicity campaign, with a view to attracting the attention of prospective buyers of wood products. Some big, dominant idea should be selected, round which to build such a campaign of publicity as will attract attention and secure the public interest. There are so many excellent features about wood, its growth and development that there is no paucity of good, substantial ideas and the material from which to evolve them. Quality and service, always big, upstanding factors in the growth and development of business, should occupy a conspicuous place in every plan that contemplates constructive effort to renew and energize business. I take much pride in calling attention to the unusual progress that has been made in the recently organized campaign of publicity for birch by the Northern Hemlock and Hardwood Manufacturers' Association of Wisconsin and Northern Michigan. It is surprising how much real, practical interest has already been manifested by architects and consumers, plainly evidencing the fact that all too little real knowledge of this beautiful wood has previously been disseminated. At a recent meeting of our association one of the leading architects of Chicago was asked to address the association on the subject of wood from the standpoint of the architect. His remarks introduced a subject that significantly demonstrated the need for just such a campaign of publicity as was afterward decided upon for our beautiful birch. The instance is so peculiarly apropos of this contention for greater publicity and better selling effort that I shall repeat it for your benefit. The architect referred to had just completed the erection of a residence for his own occupancy, and, preceding the work of construction, he had made a very careful investigation of the various woods from which to make a selection for his home.

The personal interest in acquiring n exact knowledge of woods, arising from the fact that the material was to be used for his own purposes, prompted this architect to pursue an intensive study of woods, justsuch an effort as every salesman should pursue to secure orders. Previously without any personal knowledge of birch, this prospect approached with an ordinary selling plea for any wood, could not have been indused to use it except that he was positively convinced of its superiority. His acquisitiveness, touched with a personal selfish interest in having just what he wanted, supplied the necessary elements so lacking in the usual selling methods, with the result that he convinced himself birch was the superior wood for every room but two in his home.

Your splendid association, conceived under auspices which, I venture to say, shall inspire confidence not only in your own membership but in the manufacturers of lumber as well, occupies a most excellent position for dispelling whatever misgivings may previously have taken possession of the manufacturers, in their conclusions pertaining to the possibilities of securing that measure of co-operation they have sought for many years. You will be the medium through which information may be systematicaly and efficiently distributed, and the community of interests so essential to a better understanding between the two great branches of our industry shall be rendered easier of solution and more readily harmonized. When a closer relationship has been estabilshed and a more intimate knowledge of the problems of each has been acquired there will follow a responsive feeling that will be gratifying and encouraging. It needs only the touch of confidence to awaken a latent feeling of kinship between the one who produces the lumber and the one who distributes it; and, once this feeling becomes solidified, new thought and new ideas will illumine the way to a lasting and enduring allegiance to principles that will more easily harmonize the mutual interests of the manufacturer and retail dealer, and thus sustain a great industry.

Canadian Hardwoods Highly Valued in Cuba

The Canadian trade commissioner at Havana, Cuba, in a recent report, says:

Comparatively few persons in Canada realize what a valuable asset we have in our hardwood forests of Eastern Canada. The quantities of hardwood burned every year in the process of clearing up the land in Canada is enormous, and immense quantities of some of our most valuable wood, such as bird's eye maple and curly birch, are being used year after year for firewood for our houses. Cabinet makers here say that they would be glad to buy our ash, birch, and maple for the manufacture of furniture, and say also that these woods, when made up and polished, make as rich looking furniture as do the Southern woods.

The price of mahogany and Cuban cedar is steadily advancing, and to-day mahogany is being sold by wholesale dealers at from $110 to $130 per thousand, and cedar from $120 to $140 per thousand. Some of our hardwoods, such as curly birch and bird's eye maple, would bring as high a price in Cuba as mahogany or cedar, and when a person uses a log of bird's eye maple or curly birch for firewood he is probably using for fuel wood that is worth from $75 to $100 per thousand. In cutting timber for firewood, all hardwood logs perfectly sound, free from knots, seams, or other blemishes that are found to have a particularly good grain should be put to one side, to be sold for manufacturing purposes, and logs substituted for fuel that are seamy, hollow, knotty, or have other defects that would render them of no special value for manufacturing purposes.

Good, sound ash, birch, and maple lumber is in demand here for making furniture, and will sell at high prices.

This lumber should be shipped to this country in the round log, as sawn hardwood lumber is liable to warp and check when coming into a hot country, which would detract greatly from its value. This lumber could be shipped in car lots to Boston or New York and thence by steamer to Havana, or could be shipped direct to Havana by rail via Key West.

Lumber Price Comparisons

The Brookmire Economic Service, of New York, gives a price basis on hardwoods for the month of September of $55, as compared with the same price a month previous, $45.60 the year previous, $42.20 two years previous, and $41.60 three years previous. The yellow pine average price based on values of fourteen grades is said to have been $31.32, as against the same price for August and $21.04 a year ago, $17.30 two years ago, and $18.61 three years ago.

Canada's exports of forest products during the twelve months ending August, 1917, amounted in value to $53,241,745, as compared with $55,004,835 during the twelve months ending August, 1916, and $45,658,916 during the twelve months ending August, 1915.

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9 ft. wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. BRAZEL PLOWS cut 6 in. wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road, leaving a clean roadbed. Roll up and push entirely away from the road, 18 inches of loose snow each time the plow passes over.

EDGINGS

Ontario

D. L. Schaefer & Co., St. Thomas, Ont., recently lost their planing mill by fire. The loss is estimated at $7,000, and is partly covered by insurance. The owners will rebuild, and new machinery and general equipment will be required.

The Pine Lake Lumber Company, Ltd., of Pickerel, Ont., are now moving their mill, purchased from the Ontario Lumber Company on French River, up to Pickerel, Ont., where they are erecting a new mill, which will be ready for next seasons sawing.

The C. E. Fleming Tie and Lumber Company, Ltd., has been incorporated, with head office at Ottawa, Ont., and capital stock of $100,000, to carry on business as timber and lumber merchants, saw and planing mill proprietors, etc. Among those interested are F. X. Plaunt, C. E. Fleming, and P. J. Villeneuve.

The Arnprior Cabinet Company, Ltd., has been incorporated, with head office at Arnprior, Ont., and capital stock of $100,000, to carry on business as building contractors, woodworkers timber, and lumber manufacturers, and to manufacture and deal in articles of all kinds in the manufacture of which timber, lumber, and wood are used.

The Harris Tie and Timber Company, Ltd., has been incorporated, with head office at Ottawa, Ont., and capital stock of $100,000, to carry on business as timber and lumber merchants, saw and planing mill proprietors and to manufacture lumber and woodenware of all kinds. Among those interested are F. X. Plaunt, H. P. Plaunt, and P. V. Villeneuve.

The Soo Pole and Tie Company, Ltd., have been incorporated, with head office at Sault Ste. Marie, Ont., and capital stock of $500,000, to carry on business as loggers and to operate sawmills, planing mills, and to manufacture and deal in lumber, timber, and wood of all kinds. The provisional directors of the company are H. F. Partridge, E. D. Alger, and J. L. O'Flynn.

The Porcupine Pulp and Wood Company recently purchased extensive timberland areas in the Porcupine district. Arrangements are being made to cut timber this fall, a large portion of which will be exported to the United States. Among those interested in the company are A. C. Hastings, Holyoke, Mass.; P. Schoellkopf, A. A. Oatman, F. Chormann, E. E. Mansfield, G. F. Nye, and H. W. Isaacs.

Good progress is being made in connection with the plant of the Port Arthur Pulp and Paper Company, Port Arthur, Ont. A. G. Pounsford, general manager of the company, states that the first digester is expected to be in operation during November. The construction on the mill commenced on April 13 last. All the buildings have been roofed in. The plant will have a capacity of 60 tons a day, half bleached and half unbleached, and will supply the mills of the Provincial Paper Company at Mille Roches, Georgetown, and Thorold, which are behind the Port Arthur enterprise. It will also have some tonnage for sale.

Tenders are being called by Hon. G. H. Ferguson, Minister of Lands, Forests, and Mines for the Province of Ontario, until December 17, for the right to cut pulpwood and pine timber on a certain area situated in the vicinity of Kapuskasing River, in the districts of Temiskaming and Algoma. Tenderers are to offer an average rate per cord for all classes of pulpwood, whether spruce or other woods. The successful tenderer will be required to pay for the red and white pine on the limit a flat rate of $10 per thousand feet board measure. He will also be required to erect a mill or mills on or near the territory, and to manufacture the wood into pulp and paper in the Province of Ontario. Tenderers will be required to deposit a marked cheque, payable to the treasurer of the province, for $25,000, which will be forfeited in the event of their not entering into an agreement to carry out conditions, etc. The deposit will be held until the terms and conditions of the agreement have been complied with, and may then be applied by the Minister in payment of accounts for dues or other obligations due to the Crown. Full particulars may be obtained from the Minister.

Eastern Canada

The Mercantile Lumber and Supplies Company, Ltd., Montreal, P.Q., has been registered.

The Canada Steamship Lines, Ltd., 9 Victoria Square, Montreal, P.Q., are contemplating building a shipyard at Cap de la Madeline, P.Q.

Fraser Brace & Co., 83 Craig St., Montreal, P.Q., are in the market for a large quantity of British Columbia fir and general lumber used in shipbuilding. The engineer is G. G. Underhill. The company will do their own buying.

Provincial Industries, Ltd., Doreil, P.Q., are operating the limits of the former St. Simeon Lumber Company, Ltd., which has gone out of existence. The company are cutting pulpwood only, and will take out from 30,000 to 40,000 cords during the present season.

In the report of the Quebec Streams Commission, just issued, it is stated that the Brompton Pulp and Paper Company has been awarded the sum of

$144,465, payable in 4½ per cent. Quebec Government bonds, for certain rights and interests in dams on Lakes St. Francis and Aylmer, reserving, however, the use of the waters stored for the purpose of driving its logs, free of charge. The award was by arbitration.

Western Canada

F. L. Buckley, of Vancouver, formerly manager of the British Canadian Lumber Company, has purchased the mill at the mouth of Kyak River, and will cut principally spruce.

McCarter Shingle Company, Victoria, is the new name of Victoria Shingle Mills, Ltd. P. E. McCarter and W. K. McCarter are interested in the company. The capacity of the mill is about 80,000 shingles per day.

The Graham Island Spruce and Cedar Company, Ltd., has been incorporated, with head office at Prince Rupert, B.C., and capital stock of $40,000, to carry on business as timber manufacturers, shipbuilders, etc.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 28th day of November, 1917, for the purchase of License X461, to cut 6,290,000 feet of Douglas fir, hemlock, cedar, and spruce on an area situated on Agamemnon Channel, N.W.D.

The Pearson Shingle Company, Ltd., has been incorporated, with head office at Vancouver, B.C., and capital stock of $10,000, to carry on business as shingle and lumber manufacturers, timber merchants, loggers, sawmill proprietors, and to deal in timber and wood of all kinds.

The North Canada Lumber Company, Ltd., has been incorporated, with head office at Vancouver, B.C., and capital stock of $10,000, to carry on business as timber and lumber merchants, sawmill proprietors, manufacturers, and dealers in sawlogs, timber, piles, poles, laths, sash and doors, etc.

Thurston-Flavelle, Ltd., have been incorporated, with head office at Port Moody, B.C., and capital stock of $250,000, to carry on business as loggers, lumbermen, sawmill men, and timber manufacturers. Among those interested are R. J. Thurston and A. Flavelle, of Port Moody, B.C., and J. D. Flavelle, of Lindsay, Ont.

A company has been incorporated in British Columbia known as the National Patents, Ltd., for the development and manufacture of smokeless fuel from wood waste. The experimental plant has been constructed at Nanaimo, B.C., where fuel is being manufactured in small quantities. Walter Thomas, Nanaimo, B.C., is manager of the plant.

Quebec Cullers' Report

The following comparative statement of timber, measured and culled to date, is furnished, under date of October 6, by the Quebec Supervisor of Cullers' office:

	1915. Cubic feet.	1916. Cubic feet.	1917. Cubic feet.
Waney white pine	399,280	142,160	87,160
Oak	110,120	321,160	103,360
Elm	46,840	69,440	110,240
Ash	840	1,680	320
Butternut	.....	40	.....
Birch and maple	48,880	46,880	15,880
Pitch pine	.....	.....	41,230
Fir	.....	.....	36,490

The Forest Mills of British Columbia, Limited, will log 15,000,000 feet for Cascade and 10,000,000 feet for Nelson this year.

J. O. Cameron, president of the Cameron Lumber Company, Victoria, has been elected vice-president of the Association of Pacific Coast Port Authorities.

The fourth quarterly meeting of the Eastern Lumbermen's Association was held at Bangor, Maine, on October 11. The business meeting took place in the afternoon, and a dinner was held in the evening.

Japanese paper manufacturers are getting ready to take a large quantity of sulphite pulp from British Columbia, and reports received by the government are that a large plant is being erected at Tokio for the manufacture of paper products, the cost to be $2,500,000. The construcion is by arrangement with the Japanese Government.

The entire output of airplane spruce of every mill on Grays Harbor, Wash., has been commandeered by the United States Government for use in building air fleets for the Allies. The United States Secretary of War has wired to the mill men in this district to speed up spruce production and deliveries. His request is being complied with fully.

One of the Pacific Coast pipe companies reports a large sale of material for a 12 ft. diameter penstock for a power development project in New York State. The total length of the line is 10,440 feet, the creosoted portion is 3,500 feet, and the untreated portion 6,940 feet in length. The entire amount of stave material involved in the order is 1,800,000 board feet. Creosoted stave pipe was substituted for reinforced concrete, included in the original plan.

"By-Pass" Blower Systems
for green saw dust and wet stringy material
Material that usually clogs the ordinary Blower is handled easily and continuously by our "By-Pass" Blowers. No material passes through or around the fan. That is the big secret of "By-Pass" success. Slow speed and minimum power are other strong features. Write for literature and all details.
We manufacture and install complete systems

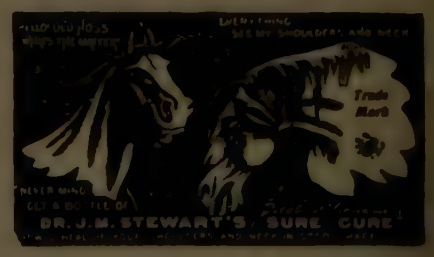
Your New Saw Mill

Will give you the best service and the longest service with the least expense for upkeep—If it is a Fisher & Davis Mill.

Catalog of Saw Mills, Edgers, Planers, etc., is yours for the asking. Ask to-day!

FISHER & DAVIS MFG. CO. St. Louis, Mo.

Insure your horses against sickness



Why not? You protect your mills against fire by installing fire-fighting apparatus; you protect your employees against accident by the use of machinery guards—then why not protect the health and efficiency of your horses? And how? By keeping in your stables a good supply of Dr. Stewart's Veterinary Remedies.

It may be the means of saving the life of many good horses, and will keep them sound and vigorous at all times.

A LIST OF DR. STEWART'S VETERINARY REMEDIES

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

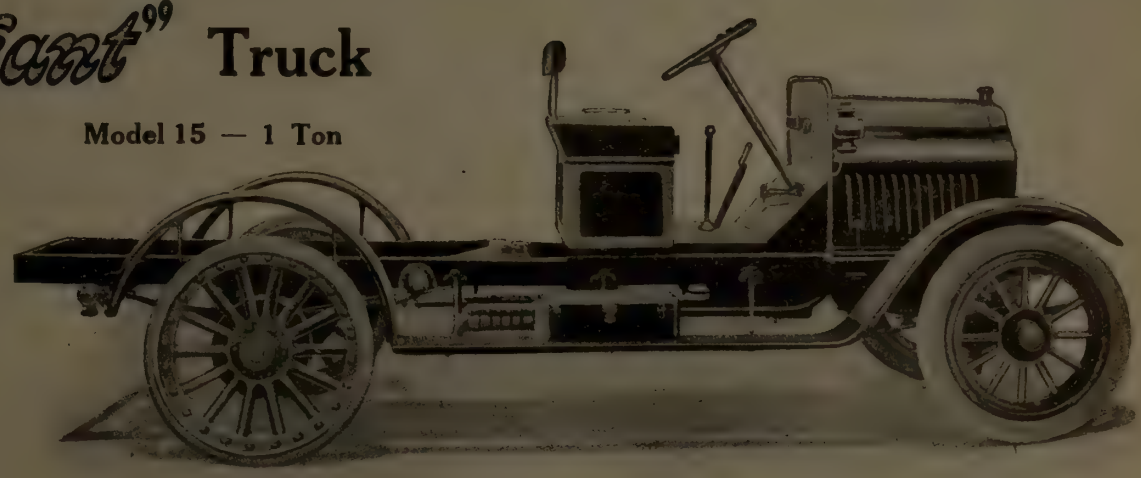
Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

The "Little Giant" Truck

Model 15 — 1 Ton



The Little Giant is without doubt the most logical motor truck for your business.

Highly standardized—perfectly equipped — built to withstand maximum wear and tear — this car stands for real delivery efficiency.

Note in particular the exclusive feature which will save you 50 per cent. in fuel.

Special Features

Timken Worm Drive
Continental Motor
Schebler Carburetor
Ross Irreversible Steering Gear
Eisemann High Tension Magneto

The DUNTLEY Hydro-Pneumatic Gas Generator is an exclusive feature of Little Giant Motor Trucks. With this device the Little Giant Truck may be operated on a mixture of one-half kerosene and one-half gasoline, at a saving in fuel cost of over 50 per cent., with a total absence of carbon, smoke or odor.

Standard Models

"H 4"—1½ tons Chain Drive
"15" — 1 ton Worm Drive
"16" — 2 tons Worm Drive
"17" — 3½ tons Worm Drive
"18" — 5 tons Worm or Chain Drive to order

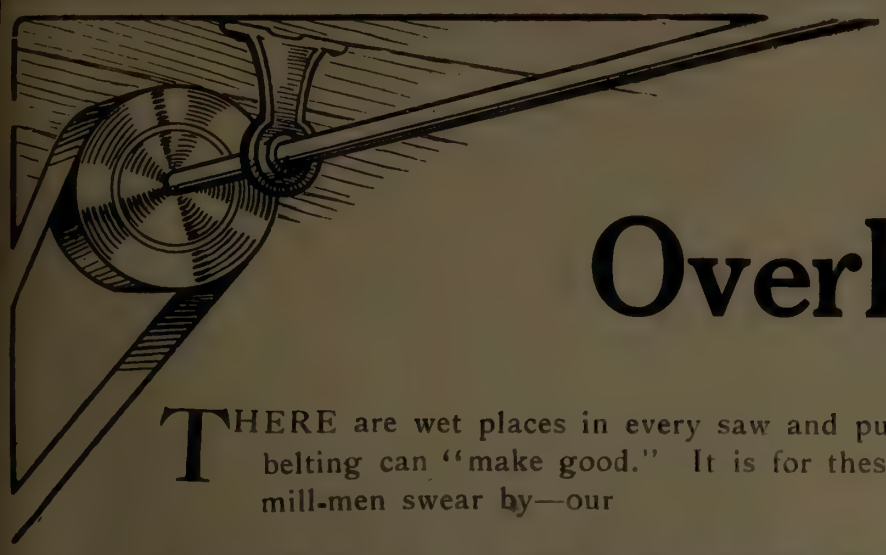
Hard to Get Men ?

Then Use MACHINERY

Our Hoisting and Haulage Engines will help you out in your labor problem, and at the same time ***save you much money*** by handling your logs and other timber more quickly and at a lower cost.

Get in touch with our experts, who will advise you as to the best way to use Machinery in place of Men in handling your output.

MARSH & HENTHORN, Limited, BELLEVILLE, Ont.



When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good." It is for these wet places that we recommend what most mill-men swear by—our

"ACME WATERPROOF" BELT

this belt is especially made for a rough and trying service. It has less stretch than any other belt by 15 to 25 per cent.

When you are overhauling try a Goodhue "Acme Waterproof" belt. Other Goodhue belts are "Extra" and "Standard."

Prices and Particulars on Request.

YOU NEED "LITTLE DAVID" FOR WOODEN SHIPBUILDING

— MORE WORK AND LESS WORRY —

The "Little David" Wood Borer is the "Shipbuilders' Wood Boring Machine," because it is light, powerful and speedy, and above all, simple and durable.

It is made in three sizes, the smallest boring holes in wood 1" diameter and under, and the largest, 4" diameter and under.

All sizes are reversible, and the cases are of aluminum with steel bushed cylinders. This explains why the largest size is about ten pounds lighter than any other wood borer of equal capacity.

We have other labor-savers for wooden ship work, such as the CC-101 Drift Bolt Driver, Pneumatic Hammers adapted for trenail driving, and Pneumatic Tools for horsing oakum, etc.

Our nearest branch will be glad to give you full information, and to send bulletins, etc., at any time.

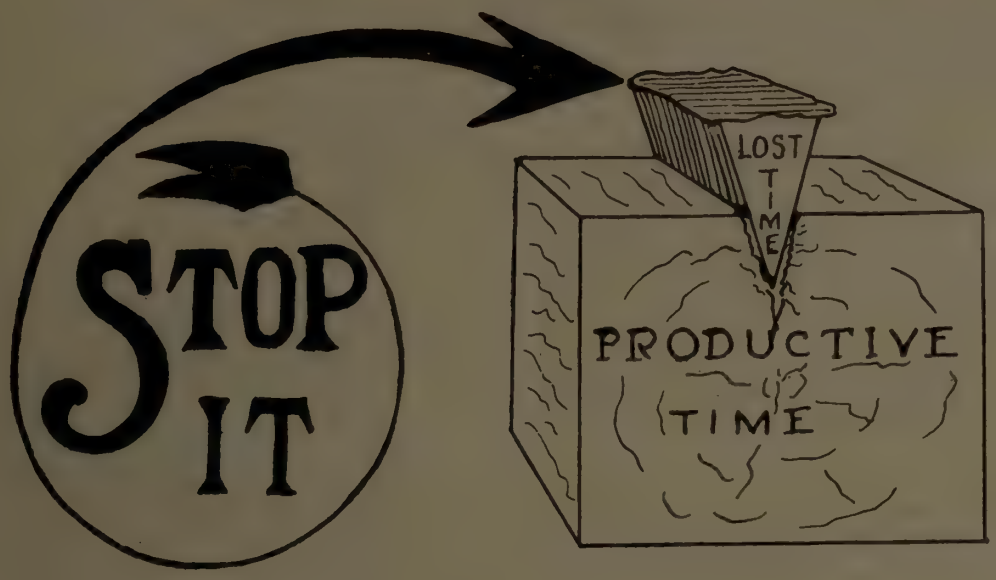
A Dangerous Wedge



Stop Losing Productive Minutes—Install International Time Recorders

Without an automatic, reliable check on the time you purchase the "Lost Time" wedge is slowly but surely eating into your profits. An International Time Recorder in your plant will stop this labor leak.

Every employee in your business will record his own time He will be on time, and usually ahead of time. When he is late, his record shows the time in red, and leaves no room for dispute or alteration.

International Time Recorders show your employees that you wish to treat them all fairly and honestly. This means freedom from dissatisfaction on both sides.

You cannot actually control your business unless you have accurate time records—unless you know. Let us show you where an International will do this for your business.

Buy at Home—Ours are the Only Recorders Made in Canada

Lath

Shipment by car, canal boat or cargo.

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

Douglas Fir

Red Cedar Shingles

Hard Pine

Maple Floors

We manufacture Spruce at our own Mills at Portage, Maine, U. S. A., and therefore we know what big prices mean to the manufacturer

11 Broadway, NEW YORK, N.Y., U. S. A.

ASTONISHING REVELATIONS!

THE Honorary Advisory Council of Scientific and Industrial Research appointed by the Dominion Government to ascertain what steps can be taken to prevent the existing waste, and to promote the conservation of natural resources, has brought to light some startling facts during its sitting in British Columbia. The enquiry dealt especially with lumber production and by-products. The president of a big lumber company said that "in handling trees for ordinary timber purposes, fully half the bulk was left behind, and 20 per cent. was lost by sawing boards alone." There is no reason why this "waste" should not be fully utilized and turned into a money-making account.

UTILIZATION OF WASTE WOOD

We have a wide experience in the design and construction of complete plants for the economical using of waste woods.

DISTILLATION PLANTS PULP MILL EQUIPMENT
WASTE SULPHITE LIQUOR FERMENTING PLANTS
OXALIC ACID PLANTS ALCOHOL PLANTS

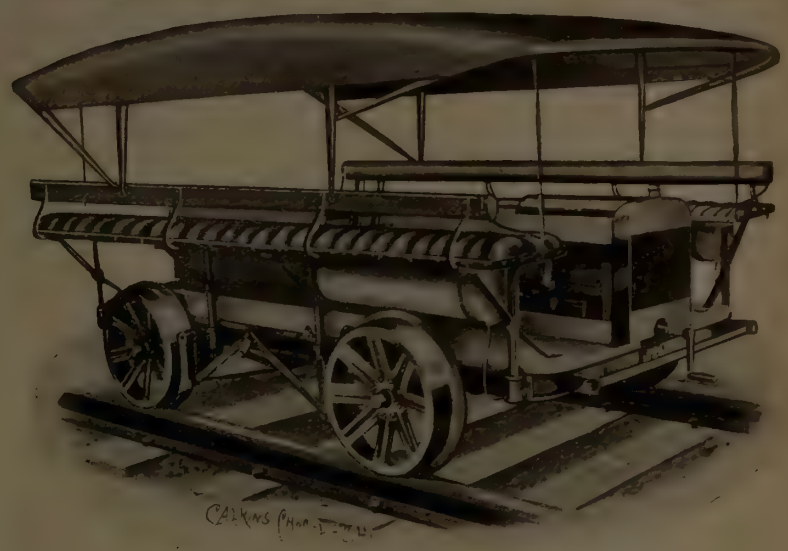
NATIONAL Railway Motor CARS



For Passenger Service

We recommend this car highly for lumber companies operating a short line railway, as it is an ideal car for light passenger service, or tractor for hauling supplies, moving crews, etc. Frame is of 3 x 1⅜ x 5/16 channel steel; axles 1 11/16 inches with Hyatt roller bearings; 20 inch pressed steel wheels of extra strength. Four cylinder, four cycle, water cooled, 10-12 h. p. engine, equipped with Atwater-Kent ignition system, float feed carburetor with throttle and spark control, and kerosene attachment. We also equip the car with friction drive as it gives a variation of speed and power. Reverses by shifting friction wheel over center on the disc, and runs in either direction equally as well. Seats are nicely upholstered, with lazy backs; folding top with jiffy side and end curtains. The car is a complete job that will cut operating expenses in quarter.

Price Complete $600.00 F.O.B. Factory.—If interested write us for complete descriptive matter or place order direct from this ad. 4L

Northwestern Motor Co., 1500 Spring Street **Eau Claire, Wis.**

ONTARIO
Canada's Banner Province

Ontario's timber production last year valued at $26,774,937 or 40% of Canada's total output.

Pine production, 905,442,000 ft. B.M.
Pulpwood, 246,282 cords.
Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.
For maps and full information regarding Ontario, apply to

EST. 1880 "FACTS FIRST"

James D. Lacey & Co.

EXPERIENCE : RESOURCES : PRECISION

The Biggest Fortunes

in the lumber business have come through timber ownership.

For 37 years we have kept careful, scientific watch on timber values and have helped to make fortunes for many investors. On the basis of this experience we say—

Buy Timber Now

We are unquestionably at or near the end of a period of depression in values. If you buy now and buy right you will make money. Buy through us and we shall see that you buy right.

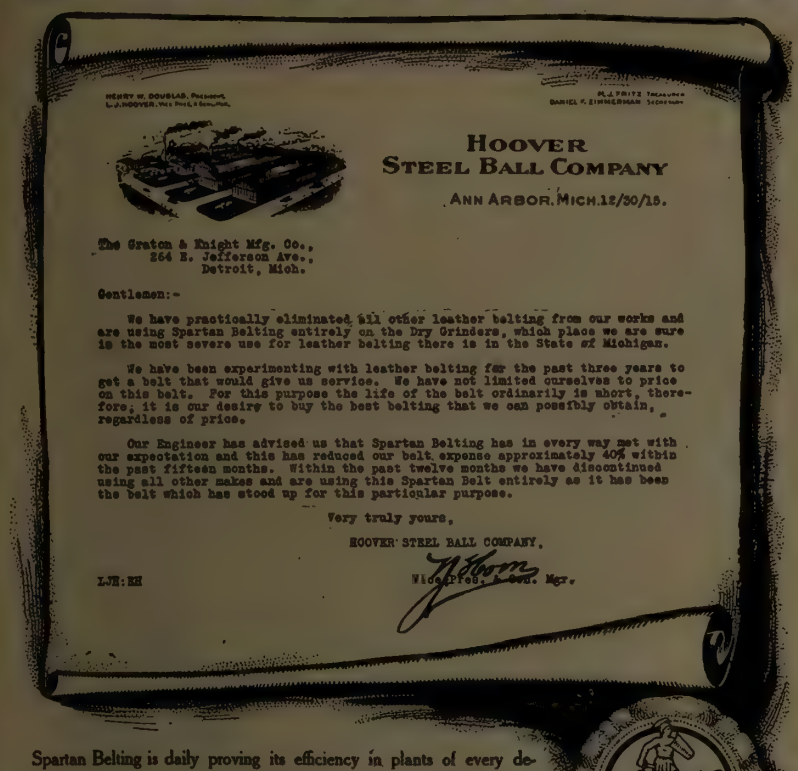
BELTING EXPENSE REDUCED 40%



Spartan Belting is daily proving its efficiency in plants of every description—proving it so conclusively that Spartan is fast becoming the universal equipment for all drives where the physical conditions are quickly ruinous to ordinary belting.

The use of Spartan Belting in your mill will mean the solution of your Hard-drive problems—it will mean greater, more efficient and more economical service. Why not select one or more of your difficult drives and put Spartan to the test?

Saw Gumming is an All Important Job

And the success of this job in many a saw mill depends upon

Aloxite Saw Gumming Wheels

For the reason that they cut cool and clean and fast, even when forced to the limit—and they hold their shape—show long life.

There is nothing superior to Aloxite for steel grinding—it is hard, sharp and of just the right degree of toughness and Aloxite Saw Gumming wheels are

The Right Wheels in the Right Place

Suppose you let Carborundum service help you to better grinding service.

ATKINS

ALWAYS AHEAD!

The most advanced improvements in Saw manufacture have placed us far ahead in the manufacture of Saws for all uses.

Our Band and Circular Saws are worthy examples. They cut more timber—do it with less power and require less repair to be kept in perfect condition.

Economy in mill operation has proved their value. Put them through competitive tests with other Saws.

The Sterling quality of

Atkins Sterling Steel Saws

will overcome your difficulties.

EISENDRATH'S CELEBRATED HORSE HIDE

Be sure you get "ASBESTOL" every time you buy work gloves or mittens. Insist upon having them and no other kind. Don't let anybody tell you that there is anything as good as "ASBESTOL." We make 'em and we know that "ASBESTOL" is the best work glove manufactured today.

Notice to Jobbers:

If you are not selling "ASBESTOL" Gloves and Mittens now get busy and stock them for your trade.

Eisendrath Glove Company

2001 Elston Ave. - - CHICAGO

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

Steel Saw Carriage

The illustration shows our 3-block standard steel saw-mill carriage, the knees of which recede 44" from saw line. This carriage can be furnished in any number of head blocks or axles, also equipped with steam set works attached to either our No. 3 or No. 4 set.

The carriage is carefully designed throughout and is giving excellent service in mills all over Canada.

When you overhaul your mill

don't waste money on extensive repairs to machines whose days are done. You will save money both in your operating costs and in the improved quality of your lumber if you install new "Long" saw mill machinery.

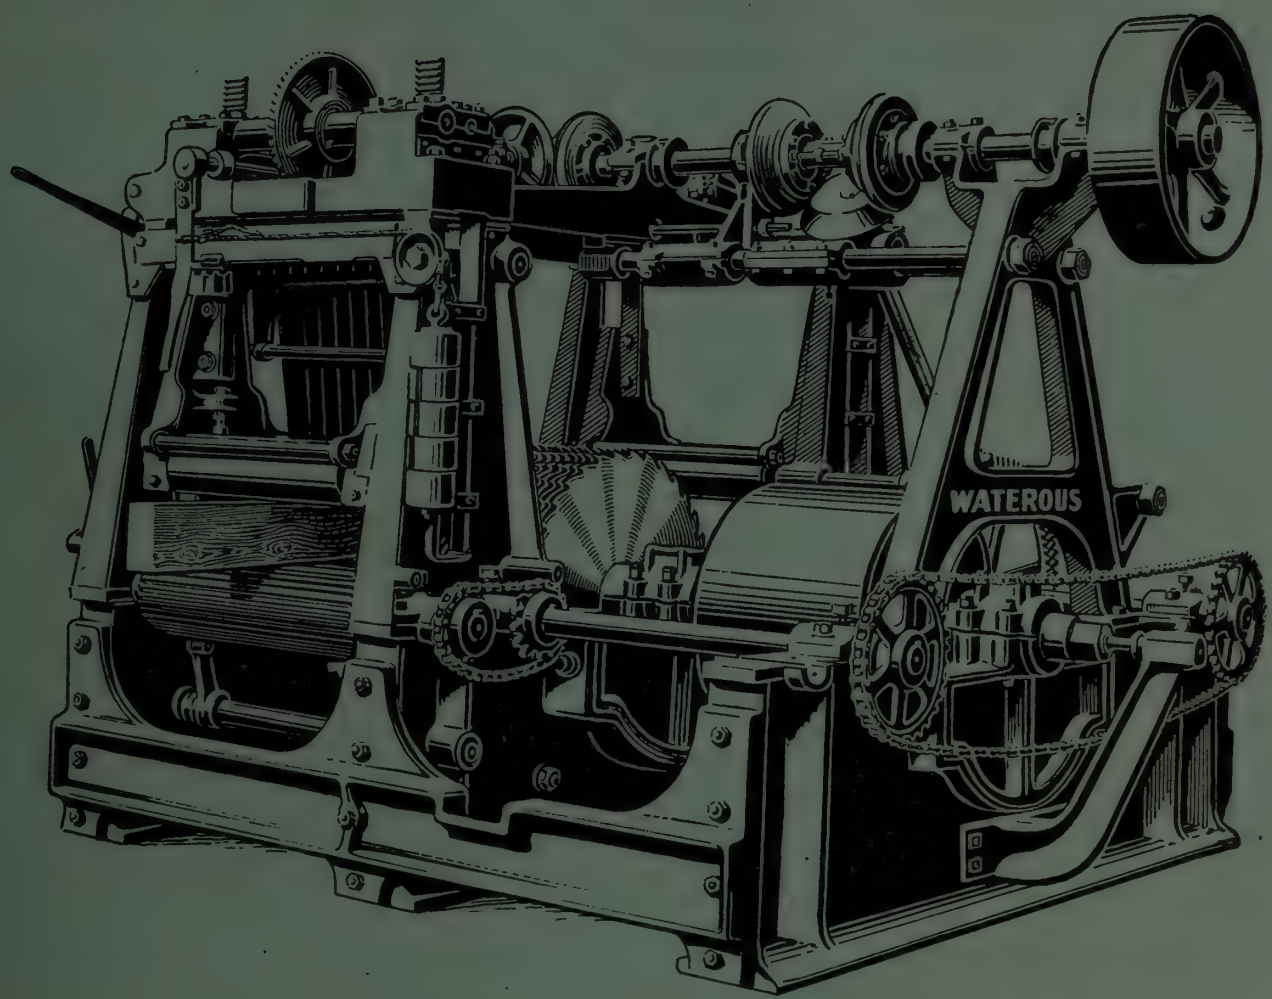
Let us talk to you before you start to overhaul

The E. Long Manufacturing

Company, Limited

Orillia - Ontario

The 1917 Model Kendall Circular Gang



A New Machine That IS New

This illustration shows the latest development of the Kendall Circular Gang.

It takes cants from 4 in. to 12 in. thickness at the rate of from 2500 to 3000 a day, will turn them into lumber, perfect in finish and cut evenly from end to end.

Big capacity on small logs, and lumber cut better than is possible on Band Saw, Circular or Vertical Gang, distinguish this machine.

It meets the demand for a machine that will turn small logs into merchantable lumber economically. Those already in use have proven their worth.

While all good points of previous models are retained, such weaknesses that use has made apparent have been eliminated. The new features and better construction of this 1917 Kendall Gang meant an appreciable increase in capacity, in nice cutting ability, and in safety, convenience and sturdiness.

This latest development of the Kendall Gang patents is built in a shop that has specialized in high class machinery construction—that has built machinery for Canadian sawmills for more than fifty years. Our reputation is a guarantee that this New Model Kendall Gang is built as it should be.

When you investigate the Circular Gang question see that you get facts and figures of the "WATEROUS KENDALL GANG"—the New Machine that IS New.

The Waterous Engine Works Co., Limited

BRANTFORD, CANADA

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 30c per lb., Fort William and East; West of Fort William 35c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, 40c per lb.; West of Fort William, 45c, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

HOYT METAL CO., Toronto, Canada

Have factory and office at Eastern Avenue and Lewis Street, Toronto, Canada

Private Phone Exchange

East Toronto June 17/10

Chapman Double
Ball Bearing Co

Dear Sirs
in regard to double ball bearings supplied by you, we find those on line shafts giving entire satisfaction and find them quite a saving on power, as for the ball bearing loose pulleys, they are decidedly the finest, and only satisfactory loose pulley we have ever had, no noise no heating and consequently no loss of time, which so frequently occurs with the ordinary loose pulley, we have run the loose pulleys on our big matcher for nearly two years and consider it a severe test and it runs as nice to day as the first day we used it can recommend your bearings and pulleys to any one in the manufacturing business especially planing mill work which we have proved

Yours very truly
L A DeLaplante Limited
per W. Graham Supt

Chapman Double Ball Bearings

have been installed in over 3000 factories of all classes during the past fifteen years, and the above letter is one of many of a similar import, bearing testimony to the efficiency, long life, and cleanliness of the bearing. Some of these have been compiled in a booklet, "Results", which we will be pleased to send on request.

The Corbet Automatic Double Cylinder Steam Towing Machine

Made in four sizes, accommodating Flexible Steel Hawsers from ¾-in. dia. up to 1½-in. dia.

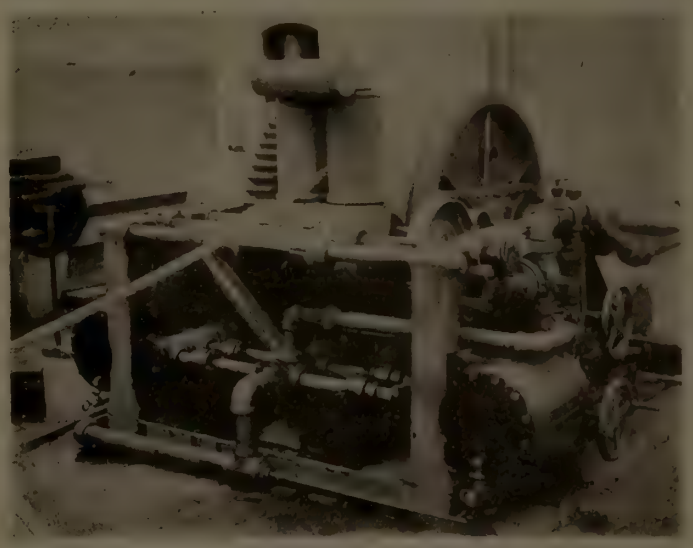
A large number of our machines are installed on Tugs on the Atlantic and Pacific Coasts and on the Great Lakes.

They increase the efficiency and earning power of the Tug.

Does away with having to buy new Manilla Towing Hawsers every spring.

The Steel Hawser will last at least 10 years.

Keeps the crew contented and gives perfect satisfaction.



Read what one of our Customers says.

"TESTIMONIAL"

THE MIDLAND TRANSPORTATION CO.,
Midland, Ontario.

Messrs. The Corbet Foundry and Machine Co., Ltd., Owen Sound, Ontario:

Dear Sirs,—I have pleasure in reporting to you that the No. 3 Automatic Steam Towing Machine, which has 1,350 ft. of 1¼-in. dia. Flexible Steel Hawser on it, which you installed on the tug "Lucknow" this spring, has been satisfactory in every way. The machine has sufficient power to haul the cable in at all times while the tug is working ahead. The Automatic Valve works well when in bad weather, and we find no jerk on the cable. This machine is a big improvement and safer than the Manilla line.

Yours truly,
THE MIDLAND TRANSPORTATION CO.,

The Heat in Your Steam Condensation

What Are You Doing With It?

A big economy or a big waste?
A big saving of a big loss?
Which is it in your plant?

Are you returning the condensation in your steam lines immediately back to the boilers as pure hot feed water—or are you allowing it to clog up your apparatus and slow down the operation of your plant?

The thousands of concerns—both large and small—who use the

Morehead
Back to Boiler
SYSTEM

turn the water of condensation right back to the boilers at from 270 to 312 Degrees F.—save from 8% to 10% in coal over the wasteful steam pump—and at the same time keep every inch of heating surface on their equipment working at the highest possible thermal efficiency.

If you are still depending upon steam pumps or other makeshifts for handling the condensation in your plant you can convert a big loss into a big saving by investigating the Morehead System at once. For complete particulars address

GENUINE BRITISH-OAK TANNED

Leather Belting

Genuine Oak

"Who can Fill the bill on that belting specification?" asked the P. A.

We Use Only Flawless Back Leather

"I suggest that we adopt the D. K. McLaren Genuine British Oak-Tanned Leather Belting" replied the Shop Boss. "To tell you the truth I've been experimenting a little; in fact, I've put this type of belting through some rather exhaustive tests, and I've got to admit it's won out."

"What particular merits has it Joe?" asked the Purchasing Agent.

"Well," replied the Shop Boss, "The secret to the whole situation is that the belting is all Flawless Back Leather, and secondly, that their tanning process practically eliminates stretching — they're mighty big assets, Jim."

"I'll take your word for it, Joe. You ought to know. I'll write them to-day. Thanks for the information," said the Purchasing Agent.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 37 **Toronto, November 1, 1917** **No. 21**

Are Canadians Alive to the Portable House Opportunities?

In the early days of the war there was much talk in Canada about the portable house trade that was expected to develop in connection with the reconstruction of the portions of France and Belgium which had been devastated by the war. It was clearly seen by those who gave the matter attention that a great demand would spring up for portable houses in which the homeless population could be sheltered temporarily until more substantial dwellings could be erected. An association was formed in Ontario for the purpose of studying the situation, and, so far as we have been able to learn, the outcome of its work was the sending of a man to France in connection with a government commission which enquired into trade opportunities in general; also the preparation of a few sample houses which were shipped to France and erected there in locations where the people would be able to see what Canadian manufacturers can produce. Also a report was published by the government commission after its return. As to actual going after the trade and securing orders for houses, there seems to have been very little accomplished.

It is not our intention to make any definite statements in regard to this situation, but to lay it before the woodworking industry once more and ask them if they think they have done all they can. There seems to have been an inclination, on the part of those who gave the matter some attention formerly, to consider that the time for getting this kind of business has not yet arrived, and that the best they could do was to make known their readiness to handle the trade whenever it should develop. In the meantime orders for shell boxes and many other products required because of the war have turned up, to save the woodworking business from stagnation, and it looks as though interest in the portable house business has been allowed to drop. In connection with many matters relating to the war there has been so much secrecy and censorship that it is difficult to lay one's finger on the actual cause of any given situation. It may be that the portable house business has not yet reached a definite enough stage to warrant going after it aggressively. It may be, on the other hand, that this is not the case, and that the woodworking firms of Canada which ought to be interested have been neglecting one of the greatest opportunities that ever presented itself; also that the Department of Trade and Commerce has been asleep at the switch while the traffic has been rushing forward in the wrong direction.

In order to put the matter before Canadians in the light of those who feel that our manufacturers have not been alive to their opportunities the best thing we can do is to refer to a letter which we received recently from a prominent business man who is in a good position to learn what is being done elsewhere, notably in the United States. We are not able to publish the name of the writer of this letter, but we can vouch for the fact that he has his ear very close to the ground and gets his information from very good sources.

"Some time ago," he says, "there were a number of editorial comments in the Canada Lumberman on this subject, but it would appear that very little interest was awakened in the minds of people who are finding business rather dull, and might have taken it into account and have been most benefited.

"I was talking to-day with a live wire from the United States. He was most surprised to notice, in his travels, the apparent lack of interest, or grasp of opportunity, or whatever else it might be, on the part of Canadian builders who have not gone after this business or taken it into account. In his conversation a number of concerns in the United States were mentioned, and the approximate number of houses that they have orders for. Some of these orders were for very large amounts.

"Even one of these large orders, or a portion of it, to say nothing of a reasonable share of all the orders, would be a great thing for the Canadian industry. Has the subject died a natural death for lack of capital, shortage of lumber, difficulty in regard to credits, or procrastination, waiting till the war is over and orders are sent here with the request 'please make for us, etc.?'

"My informant says that the United States Government is creating worlds of business for United States concerns—business of every description, and is meeting the requirements of the allied governments overseas. It would seem that a large volume of business is being lost to Canadians, but surely it is not through any lack of their having been advised. As I remember, the subject was well handled in the Canada Lumberman in the early days."

As the writer intimates, we did devote a lot of space to the discussion of this matter, and hoped that it would result in something practical being done. So far as we have been able to find out, however, it looks as though both our government and the woodworking industry of Canada have been neglecting this opportunity, and the situation is difficult to explain.

Reduced Output Now Certain

As the logging season advances it is becoming more and more evident that operations in the woods this year will be on a smaller scale even than those of last year, and that, unless something unforeseen occurs, the reduction will be of sufficient extent to become an important factor in next year's market conditions. A large number of letters which have been received by the Canada Lumberman, many of which have been published in recent issues, point to this conclusion. Usually by this time of year the woods operations have been well started, and sufficient progress has been made to enable the operators to know fairly definitely what their output will be during the winter and how much it is likely to cost. This year the situation is still indefinite. Operators are unable to foresee how much they will take out of the woods or how much it will cost. Nothing whatever seems to be certain as yet, except that operating costs will be exceptionally high and labor scarce and inefficient. Many operators report that they are far behind in their woods work and that the present indications are that they will not be able to catch up. This means a reduction in output, which is variously estimated at from 25 to 75 per cent., many of the reports received placing it at 50 per cent. at least.

The labor situation seems to be the chief factor in this widespread

reduction of operations. Of course, the increased cost of supplies is also important, but this is something which the manufacturers can fairly well estimate in advance; and, in spite of the high cost of supplies, they have, in most cases, decided to operate as extensively as possible. The labor shortage, however, is an altogether different matter; it may go from bad to worse, and there are many operators who fear that it will do so, thus greatly crippling their efforts to take out a sufficient quantity of logs. Such labor as is available to-day is far below the average of the past few years in efficiency, and would be considered expensive even at normal rates of wages. The high wages which must be paid to-day render it extremely costly, and when this is taken into consideration in connection with its uncertainty, the situation can be appreciated by anyone who knows the importance of getting steady crews which can be counted upon to remain in the woods throughout the winter and to produce a good quantity of logs.

There never has been such a labor situation in the woods as that which prevails to-day, and the outlook with the Military Service Act in force, is for still greater disturbance. In numerous cases the only reason why manufacturers are keeping such crews in the woods as they can obtain is their desire to keep intact their producing and manufacturing organizations. A letter received recently from a large manufacturer in Ontario puts the situation clearly. He says:

"Briefly, the conditions may be stated as: Labor, 30 to 50 per cent. short of requirements, and what we have away below the average in efficiency; wages abnormally high.

"We are not able to get our camps filled, and men are so restless that they are going about as fast as we can bring them in. Within the past week the situation seems to be a little better, and we are getting more men and keeping them, but whether this is temporary or not we do not know. The carrying out of the provisions of the Military Service Act is bound to create some disturbance, the extent of which time alone will tell. We realize, as never before, our impotence and how completely we are creatures of circumstances. We think the majority of manufacturers take the same position as we do—that if they could keep out of the woods without destroying their producing and manufacturing organization they would prefer to do so.

"The certainties of PRESENT operating costs and the uncertainties of what they WILL be makes the net results very doubtful, even on the basis of present advanced selling prices. We can only hope that selling prices will advance in proportion to increased costs.

"There is no doubt but what there will be a substantial shortage in the log crop, but what it will be no one knows at present."

Is This a Penny-Wise Policy?

It has been a common thing of late years to hear the forest management of British Columbia referred to as the most modern and enlightened system of its kind in operation in North America. Certainly it is one of the best conceived systems of its kind, and has been producing very satisfactory results. One of its chief merits is the fact that it has been worked out under the co-operation of the lumber industry and the government, who are working together harmoniously in carrying out its provisions and promoting the welfare of the lumber industry and trade. It is difficult, under such circumstances, to understand the step taken by the British Columbia Government in closing the lumber commissioner's office at Toronto, which for a couple of years had been carrying on an active campaign for the increased use of British Columbia lumber products in Eastern Canada. Unquestionably this office was responsible for a great increase in the use of British Columbia products in the East, and it had just managed to get its work well planned out and running smoothly when, for reasons of economy, it was closed by the government and the commissioner was withdrawn. No one expects this step to be permanent, but there are many in Eastern Canada who are convinced that it was a great mistake to close the office even during the balance of the war.

The matter is open to argument, and resolves itself plainly into the balancing of the considerations of economy against those of practical value and protection of expenditure already made. No lumberman with whom we have discussed the matter has hesitated to characterize the closing of the office as a mistake. A great deal of valuable work which had been done, and which was largely of a missionary nature, was beginning to produce good results, and this work must now go practically for naught. When the office is opened again the missionary work will have to be repeated.

It is not possible to estimate the results of this work in cold cash and balance them against the expense of maintenance, but there is no question in the minds of those who take an interest in the matter that this office was a profitable one. It was unquestionably producing revenue by increasing business for the lumber industry of British Columbia, and this increased business was surely producing increased profits sufficient to more than offset the expense of keeping up the office. If this was being done during war times, the office could be counted upon to produce still greater results under normal business conditions, and it would have paid to keep it open, even at a loss, in order to be prepared for the business that will come later on. By stopping the work the field has been left open for competing products, which will not lose any opportunity of improving their trade, and the competition will, therefore, be all the more keen when British Columbia opens its Eastern office.

It is not possible for the Forest Service of British Columbia to carry on any effective long-range siege of the Eastern market. It is peculiarly one of those situations which necessitates face-to-face operations. The general wish of the Eastern trade is that the Government of British Columbia may see its way clear to open the office again without delay. It is a mistake to do anything of this nature spasmodically. The office was a publicity venture pure and simple. Half-hearted publicity is generally worse than none at all. In fact, the man who conducts a publicity campaign more vigorously during dull times than during times of trade activity is commended by advertising experts.

Not only has the closing of this office been something of a blow to those who were building their hopes upon an increased demand for British Columbia lumber products in the East, but it is making the handling of British Columbia trade more difficult. Without a nearby source of information regarding grades, qualities, stocks, etc., of British Columbia lumber and timber, the dealer in the East, and the consumer as well, are handicapped. It would be easy to quote many instances of how this works out. One will be sufficient to illustrate the point. A man who is to-day erecting a high-class residence found that the architects whom he approached were not well acquainted with the qualities of different woods for flooring, trim, etc. He wanted to obtain information as to the comparative merits of British Columbia fir and the different hardwoods that might be used. Had the British Columbia office in Toronto been open he could have secured this information readily. He had recourse to correspondence, writing for samples of British Columbia woods, which he would have placed before his architects. He has reason to believe that his enquiry was laid before the British Columbia Forest Service in Victoria, and, although the enquiry was made a month and a half ago, he has not received any information, and we know that hardwoods will now be specified for this house. It may be that his enquiry did not reach the British Columbia Forest Service without some delay and that the information and samples will soon be received, but it will then be too late. The presence of a lumber commissioners' office in Toronto would have resulted in British Columbia products getting an even chance on this business.

Clearly this is a proof that the British Columbia trade in the East is losing its hold because of the absence of such an office. It may be that the government and the industry in British Columbia look upon the Eastern market to-day with indifference, and consider it only as a periodical outlet for times when they find their regular markets on the prairies, in the United States and overseas, comparatively dull. Perhaps this is the real reason for the closing of the Eastern office. If it

is, we believe that the mistake is even greater than it appears to be, for there is an ever-increasing market in the East, one which would repay and effort to become well established in it, and one which will not welcome being treated as a trade safety valve, to be worked energetically only when there is not sufficient demand elsewhere, and to be neglected when the prairie and other markets are active.

New Brunswick Timberland Management

Although the Province of New Brunswick has granted outright to private individuals and companies the ownership of a larger proportion of its crown lands than any of the other provinces of Canada, there still remains under the management of the crown 7,500,000 acres, most of which is now under license, averaging as good timber contents as are to be found in the province. In one year the sum of $15,000,000 is distributed in New Brunswick from lumber and pulp products, while another million dollars' worth of wood is used by settlers for fuel and building materials. The government of the province obtains over $500,000 a year from the various crown timber taxes, and this sum will be materially increased by the recent rearrangement of the dues on crown timber.

These facts explain why the government of the province recently found it advisable to commence a forest survey and land classification, a work which has been under way for about a year and a half, and has now covered more than 550,000 acres out of the total of 7,500,000 acres of crown lands. The information which has been obtained by this survey, so far as it has gone, has been valuable, and has done something to stir the government of the province out of the lethargy which has prevailed in the past. As a result, it is probable that in the near future the forest policy of the province will be of a much more enlightened nature than it has formerly been.

It is only necessary to take a glance at the history of the lumbering industry of New Brunswick to learn how the neglectful methods of the past have been a source of loss. In the year 1825 New Brunswick exported 400,000 tons of white pine to England. This timber, which was once the standard species in New Brunswick, represents to-day not more than 5 or 6 per cent. of the total lumber cut of the province. Hemlock, which was valued a few years ago only for its bark, now brings $8 to $10 per thousand feet rafted at the booms. Spruce was regarded in New Brunswick almost as a weed tree within the memory of lumber operators now living, but sells to-day at a high price. The spruce log has, in fact, become the standard in New Brunswick woods operations.

As a rule, the history of a New Brunswick timber limit has been along the following lines: First, it was worked for the choicest pine. This was followed by a second and a third culling of pine, which left relatively little of that valuable timber behind. Next the operator took out the largest spruce of saw timber size, cuting at each return what previously would have been passed over. Finally the market for pulpwood made it worth his while to take out the spruce and balsam down to the smallest legal limit. Obviously the timber limit was being stripped not only of its natural increment, but of most of its capital stock. In the case of pine, the larger part of the capital is gone. As consequence of the severe culling of coniferous species has been to encourage the growth of hardwoods of a much inferior value.

In a general way, these facts have been pretty well known to governments and timber operators for many years, but it seemed to be nobody's business to look for a remedy. The information which is now being obtained by the forest survey and the example set by some of the other provinces of Canada indicate that this negligence may be expected to be superceded by a scientific and thorough system of forest management in the near future. What such a system will involve must be for the government to decide, but the experience of other provinces should be used as a guide, particularly in the matters of fire prevention and regulation of cutting operations.

Fires have taken a great toll of timber value in New Brunswick. There has never been in that province an adequate system of forest fire protection. The system as it has existed for some years includes the appointment of a chief fire warden, with fifteen county wardens, who are in charge of a varied number of deputies. By this system 160 men, on an average, are on the government pay-roll as permenant fire wardens. The fire wardens receive varied remuneration, some $2 a day, some $250 to $300 a year. Some county wardens receive up to $900 a year. Last year the average pay received per man was about $52. For such ridiculous pay no man can be expected to give service of any value. British Columbia this year is paying its forest rangers $100 a month for a six months' period. Ontario pays a minimum of $75 a month. Quebec pays an average of $60 a month.

These facts are vigorously outlined and discussed in a booklet published by Robson Black, secretary of the Canadian Forestry Association, which contains a strong argument in favor of bringing New Brunswick's forest fire protection system and its crown lands management up to date. Other parts of Canada, he points out, have built up forest guarding systems which completely outstrip in actual results the methods that preceded them, and there is no reason why the same thing should not be done by New Brunswick. A reform of this nature, together with the adoption of efficient methods of supervising cutting operations and timber scaling, all controlled from one department of the government, would put New Brunswick in a position where its people would know that its timber was being cut and marketed to the best possible advantage. Without vigorous administration of its timber lands there is nothing more certain than that within a comparatively few years the history of the destruction of the pine timber of the province will have been repeated in connection with the spruce, and the value of such timber as remains will be a mere fraction of the value that it is still possible to make the forests of the province produce in perpetuity.

Dominion Forestry Appointments to be on Merit

The announcement of the abolition of patronage in the Civil Service, contained in a statement recently issued by the new union government, is considered by Mr. Robson Black, secretary of the Canadian Forestry Association, to be a "Godsend" to the Forestry Branch of the Department of the Interior. It is specially applicable to the three prairie provinces—Manitoba, Alberta, and Saskatchewan. From the announcement Mr. Black believes that in future appointments are to be on merit, as against the old system of political influence or patronage. In the past, he states, the efficiency of the Forestry Branch has been more or less hampered by appointments made under the patronage system. This, he thinks, applies particularly to the appointment of fire rangers and others who have to do with the guarding of the forest tracts of the three provinces mentioned.

Just what system will be employed in making the appointments the Canada Lumberman cannot yet learn, but it is stated at Ottawa that the system in use by the Government of British Columbia may be partly copied. Under the patronage system a man without any woods knowledge, but with sufficient political influence, might secure a fire ranger's position though he had few qualifications for the work. Under the system followed by the Forestry Branch of the Government of British Columbia a man must possess certain woods qualifications before he gets a position. He must pass an examination, but he does not need to be a scholar. His chances of passing the examination are based on his efficiency and knowledge of woods conditions and the best methods of protecting them in the event of an emergency. About 60 per cent. of the marks on examination is allowed for experience. Twenty per cent. is for oral examination and the remaining 20 per cent. for written exercises.

Toronto Dealers Visit New York State

Retailers Entertained by the Trade at Rochester and Syracuse—Inspect Local Yards and See the Sights—An Enjoyable Two Days' Trip

The retail lumber dealers of Toronto paid a visit on October 19 and 20 to the dealers of Rochester and Syracuse, N.Y. This was the second trip that the Toronto trade have taken during the present year. They enjoyed themselves so thoroughly on their visit to Detroit and Windsor in the month of May that when a proposal was made to visit Rochester and Syracuse there was a unanimous vote in its favor. The party travelled to Rochester on Thursday, October 18, most of them taking the train and a few going over by motor car. On Friday the party mustered fourteen, and was made up as follows: J. B. Reid, W. J. Smith, W. C. Laidlaw, G. W. Boake, W. C. Irvin, T. A. Paterson, Alan Watt, F. A. Bowden, F. G. Bowden, W. B. Tennant, A. Rhind, J R. Chelew, Chris. Hillock, and H. Boultbee of the Canada Lumberman.

Weather conditions on Friday were unfavorable, and interfered with a number of visits which had been arranged. It was intended that the party should visit some of the retail yards in Rochester and be shown over the plants of the American Woodworking Machinery Company and the Eastman Kodak Company. In the morning the American Woodworking Machinery Company took charge of the visitors, and conveyed them in motor cars to their interesting and extensive plant. Once inside this plant the visitors found so much to interest them that they were unable to tear themselves away until the morning was so far advanced that further visits were not possible. At 1 p.m. the members were entertained at luncheon, and there were present a number of Rochester retailers and Mr. Paul S. Collier, secretary of the New York State Retail Lumber Dealers' Association. The luncheon was of an informal nature and was followed by a few addresses.

Retail Association Work in New York State

Mr. J. A. Detweiler, of the Spencer Lumber Company, Rochester, N.Y., occupied the chair. The first speaker on whom he called was Mr. Paul S. Collier, secretary of the New York State Retail Lumber Dealers' Association, who gave an outline of the progress of association work in New York State. One of the great advantages of co-operation, he said, was that it enabled the dealers to deal with the railways in a much more effective manner than they could individually. The association had been instrumental in getting shipments traced or speeded up in a large number of cases, and their influence was of much importance in the settlement of disputes or claims with the railway companies.

Mr. Collier spoke also at some length of the importance of systematic cost accounting. This matter had been taken up by the New York State Association in earnest, and he believed that their association was the first of its kind to go systematically into the scientific study of costs. They had decided to make a considerable outlay for this work, and were already satisfied that the results would justify it. Arrangements had been made with a firm of expert industrial specialists to study all the details of this problem, with special reference to the New York State yards. When this study has been completed the best possible cost accounting system will be installed in the yards of the members, thus furnishing them with the means of knowing their costs definitely and comparing them with those of the other yards.

Group of Toronto Retail Lumbermen on a Visit to Syracuse, N.Y.

The whole object of the association, Mr. Collier said, was to give service to its members. To do this it was necessary that it should have the fullest co-operation of its members, and that the members should use its facilities as extensively as possible. Only in this way could association work be successful. Unless the individual members took a definite and enthusiastic interest in it, the association would not be able to accomplish anything of importance. When a member took such an interest he was certain to benefit both the association and himself. It was a mistaken idea to imagine that one could join such an association simply by paying a fee and then sit back and receive the benefits of co-operation. A member could only get out of his association what he put into it. If he simply paid a fee he would get practically nothing, but if he tried to promote the interests of the association he would find that his own interests were promoted to an equal or even a much greater extent. The retail lumber trade to-day were just beginning to learn the elements and the language of co-operation. They were learning that it meant doing definite things, going after definite subjects, and trying to produce definite results. One of its happiest and most important results was the establishment of greater confidence among the individual members of the trade. When the New York State Association was commenced many of the small groups of dealers were lukewarm or even adverse to its plans, asserting that it was impossible to get the members of the trade together. This had all been changed. The retailers were now working together enthusiastically and the association was getting along beautifully.

Mr. H. Boultbee was then called upon, and described the workings of the Toronto Lumbermen's Credit Bureau.

Mr. W. J. Smith, Toronto, spoke briefly in a reminiscent strain.

Mr. C. C. Beehan, second vice-president of the Rochester Chamber of Commerce, extended a welcome to the visitors, and spoke of the work of the chamber.

Toronto's Association Experience

Mr. J. B. Reid, Toronto, the next speaker, told of some of the progress made in association work in Toronto. The lumbermen of Toronto, he said, had accomplished wonders during the past two years. They had started out with probably the worst lot of lumber dealers that ever were gathered together. Some of them had been doing business for thirty years in opposite ends of the city and thought one another the meanest men in the world, but when they were brought face to face they soon saw their mistakes and were ready to join hands in promoting the welfare of the trade.

The social side of the retail lumber business, Mr. Reid said, had been neglected in the past. Since the association idea had been introduced, however, the biggest firms in the city had come in, and were co-operating in a social and a business way. This might all have been done just as well thirty years ago and have made life better for them during all the years when they had been running one another down and cutting prices.

Before the dealers had learned how to co-operate in Toronto very few of them had known anything about how to conduct their business safely. They had paid more attention to price-cutting than to getting a profit. They figured that 50c would put a stock of lumber into their yards from the car and 50c would put it out again, and then if they got a dollar for the boss they thought they were all right. If it had not been for the profits made on land upon which they had squatted years ago not one of them would be in business to-day. During the past two years, since they had been co-operating, all these evils had been eradicated, and the retailers had been educated until they all appreciated the fact that 25 per cent. upon the cost was the least margin upon which business could be conducted safely.

The retailers of Toronto could take credit not only for what they had accomplished among themselves, but for the example they had set to the other branches of the trade. The wholesalers were now following the lead given by the retailers. It seemed a strange state of affairs, but was actually the case, that the retailers in Toronto were teaching the wholesalers how to co-operate. The wholesalers were now working out plans for a credit bureau, to protect them against bad accounts, and they were proposing to start monthly dinners similar to those which the retailers had been holding for a couple of years.

In conclusion, Mr. Reid spoke vigorously in favor of adopting and developing the association idea wherever possible. "If we leave our children the heritage of a cleaned-up lumber business, that can be run like an honest man's business, without any suspicions, clean and above board in all regards, we will have left them something better than money can buy; and I think that the Toronto retailers have made a great step in this direction. We have elevated the contractors in

Toronto by means of the credit bureau. We have made the contractors our friends. We have eliminated the dead beats from the business, have made the good contractors who are willing to pay the list price our friends, and have established them so that they can do an honest business themselves."

Co-operation's Many Aspects

Mr. H. R. Isherwood, manager of the Retail Department of the National Lumber Manufacturers' Association of the United States, was the last speaker. Co-operation was the keynote of his address. He could plainly see, he said, that the success of the retail association in Toronto was due to the confidence the members of the trade had gained in one another. This confidence would bring success to every one of them. Not only that, but the energy and efforts they had spent in the past in developing the selling end of their business had been exerted under very difficult conditions when they were not organized. When each firm was struggling against all the others there was bound to be a great deal of wasted effort. By adopting the methods of organization they not only did away with all this waste, but made business more pleasant, more friendly, and, most important of all, more profitable. The association idea was making great progress to-day. He believed that every town, city, state, and province in North America was working more or less towards this ideal. The result was that they now had many organizations, of a local, state, provincial, and national nature, and all of these associations were more or less related to one another. It was impossible for any of them to live without the others. Each organization was deserving of the support of every one for whom it worked.

In promoting the association idea among retailers one of the most difficult problems they had to deal with was the great variety of conditions prevailing in different localities. There was one very important subject, however, which could be advantageously taken up in practically any locality, namely, the subject of cost accounting. A short time ago he had been in a city in the West where there were eleven retail lumber dealers, and no organization. He visited each of the dealers and asked them how much it cost them to do business. In eight of these offices they told him that the cost was anywhere from 16 to 20 per cent. In three of the offices he was told that it ran from 9 to 12 per cent. It was scarcely necessary for him to add that the three dealers who did their business on a basis of from 9 to 12 per cent. were the cause of all the trouble in that city. They not only made trouble for themselves, but for the eight other dealers, and they had created an ill-feeling even between those eight. These eleven dealers were brought together in the evening, with the object of putting the three who were the cause of the trouble on the right track. They all met at a little dinner, and Mr. Isherwood asked each of them, in the presence of all the others, how much it cost them to do business. They naturally gave him the same figures as they had given him in the afternoon.

It was found that one of the three men owned his real estate, which was worth $10,000, and made no charge for it against the business. Further, he had a son and a daughter working in the office and gave them no salaries; simply let them have plenty to eat and wear and a little spending money. After the other dealers had got through with these three dealers, the latter put their cost of doing business up to 15, 17, and 17½ per cent. The result of the meeting was that all these dealers got to know one another fairly well, and the foundation was laid for a successful organization.

Why the Substitutes Have Succeeded

Mr. Isherwood then dealt with some of the work of the retail department of the National Lumber Manufacturers' Association. Fifty per cent. of the entire production of lumber manufacturers, he said, passed through the hands of retailers. Over 75 per cent. of the lumber sold to the consuming public in the United States was not sold; it was bought. The American public to-day knew less about the products handled by the retail lumbermen as to grades, species, kinds, and the units of measurement and cost than they knew about any other commodity on the market. The materials competing with lumber, known as substitutes, had all come into the field as new products, backed up by new ideas which had been thoroughly studied. The producers of these substitutes lost no opportunity of pointing out the advantages claimed for them over the products handled by the retail lumbermen for so many years. These points were thoroughly explained to the lumbermen themselves, until they, in many cases, decided to handle the substitutes. In this way the producers of substitute materials were taking advantage of the facilities which the lumbermen had provided for selling and handling their lumber product, and in which a great amount of their capital had been invested. The retail lumberman, moreover, as a natural result, handled these new products along the lines suggested by the manufacturers who sold them. They put modern selling methods into the handling of this stock and found that, under such conditions, it could be sold successfully in competition with their legitimate lumber stocks. This was not because the new product was any better than the lumber, but because the retailer understood that product and how to sell it better than he understood the lumber. If they would just adopt the same attitude towards their lumber-selling business, treating it as though it were a new product, and selling it in a modern manner, they would find that it would sell just as well as the substitutes.

The Dealer or the Contractor?

The National Lumber Manufacturers' Association was ready to assist retailers in adopting modern selling methods. There was no subject connected with the selling of lumber upon which it was not prepared to furnish information. In fact, it had come to the conclusion that the methods of selling lumber by retail must be changed and had decided to do all it could to bring about this change. The old method of buying lumber was for the home-builder to come to the retail yard and ask for a price. When the retailer had told him the price per thousand feet, he knew, in fact, less than he knew before. The result was that he would go back home dissatisfied, because he had not obtained the information he wanted. What he was interested in was the price of the home. To get this he would have to go to the local contractor. The contractor would probably apply the retailer's prices to a list of material and give the home-builder a price on the complete home.

The point that it was important to bear in mind in these cases was that the contractor was giving information which ought to be given by the lumber dealer. What position did this place the lumber dealer in? He became the stock-keeper and the financier, while the contractor became the seller and the man who made up the dealer's specification and told him what he could furnish. The position should be reversed. The lumber dealer should be the one who was closest to the consuming public. It was not necessary for the dealer to break away from the contractor. He ought to co-operate with the contractor, take him into his confidence, talk over the various materials to be used, and educate him as to the advantages of the materials carried in the lumber yard. In short, the lumber dealer ought to become the building authority of the community.

Building Plan Service

Mr. Isherwood then referred at some length to the subject of plan service. He had noticed in the East that plan services were not used to any great extent. In the Middle West and the West over 70 per cent. of the retailers were using them. A large number of organizations had been formed for furnishing plan service. They had spent a great deal of money in organizing for the purpose, and it was important that the retailers should recognize some one service which recommended itself to them. He did not think that any of the plan services adopted in the West were exactly suitable for the East. Therefore, the Eastern trade should take this matter up and work out a system that would be suitable to their own requirements. The one thing of great importance was that some such system should be adopted. The systems that were now on the market would be offered to the contractors if the dealers did not furnish something equally good or adopt some of the systems now existing. If a contractor got one of these plan services ahead of the retailers he would be able to make life more miserable for them than it had ever been before; but if the retailers were first in the field, the contractors would never enter it at all.

Mr. Isherwood dealt next with the importance of establishing a service department in connection with a retail lumber business. He had done this in his own business and had found it the greatest possible aid in securing customers. He had furnished plans free to the public of every kind of building that they wanted, and, although his company covered a territory eighty miles in length and operated four yards, there had just been one single building in eight years that they lost, after furnishing an estimate upon the bill. His company had not advertised the products they carried in their yards. They had only advertised their services. Having the yard and office properly furnished with service facilities brought the people to them for their materials. The people put questions to him of every conceivable description, and the result was that by the end of a year he had consulted so many circulars, explained so many samples, and looked up so many reference books and plan books that he had thoroughly educated himself on every product handled by his company. This education had been a great help in his business, because it was necessary to have a proper knowledge of one's product before it could be handled with complete success. Information gained in this way enabled a dealer to make up his estimates, offer suggestions as to kinds of materials, and solve many difficult building problems, thus putting him in the closest possible touch with the consuming public and with the contractors, and enabling him to specify the lines he carried in stock, and which he knew were best for the consumers' requirements.

Arrangement of the Retailer's Office

Another matter of much importance was the arrangement of the retail lumber dealer's office and the way in which it was kept up. Sixty per cent. of the buying power in any community was controlled by the

women. How many dealers' offices were kept in such a condition that they felt perfectly free at any time to receive the ladies? One of the most important things in a retail office to-day was its sanitary condition. If an office was kept clean and neat, and ladies were invited to come into it at any time, it would obtain a reputation that would mean a considerable increase in its business. The old practice was that if a visitor came to town and had to visit the lumber yard, he sent his wife up town while he went for the lumber himself. He did not seem to think that a lumber yard was a fit place to which to take his wife. So the wife went to some other business place, and, while she was waiting, would look around the store to see what she could buy. The power that ladies brought to bear upon the head of the house was the deciding influence in connection with nearly all purchases. Therefore, it was important for them to get their offices in such a condition that they could extend an invitation to the ladies to visit them at any time. Some dealers had an idea that this did not apply to small towns, but he had carried it out successfully in a town of 200 people, and his competitors had been obliged to adopt the same idea.

Any retailer who was contemplating alterations to his office or intended to put up a new office could obtain from the National Lumber Manufacturers' Association much useful help. If he would send them a rough drawing of the present office equipment and arrangement the association would furnish him with anywhere from one to three suggestive blue prints showing how to bring the office up to what they considered to be a standard office and giving reasons in every instance for the arrangement and equipment suggested.

Mr. Isherwood then dealt with the appearance of an office from the customer's point of view, saying that in many cases the customer found himself confronted by a long desk, wire railing, and other obstructions which prevented him from getting into personal contact with the manager. If he had a purchase in mind, or intended to settle an account, these obstructions made it just that much more difficult. There should, at least, be a portion of the desk standing at a level over which the manager could meet the customer face to face. Without any obstruction between them a dealer could carry on his business with a customer more satisfactorily and close a transaction more easily and quickly.

The subject of advertising was one of great importance to retailers. The lumber dealer ought to advertise along modern lines, and give his local paper full consideration. He believed that aggressive advertising and modern selling methods, including such plans as putting on a "Build a Home" campaign, would go a long way towards improving the slack business conditions that now prevailed. The National Lumber Manufacturers' Association was assisting in putting on campaigns of this nature, and it had also prepared a large number of publications for farmers, architects, manual training schools, etc., covering every kind of building that could be constructed of materials handled by lumber dealers. These publications were obtainable at the cost price.

In conclusion, Mr. Isherwood stated that he had had considerable correspondence with dealers in Canada, and that his association, although its membership did not extend to Canada, was prepared to furnish its publications, samples, etc., to Canadian dealers, the same as to those in the States.

At the conclusion of the meeting Mr. J. B. Reid moved a vote of thanks to Mr. Collier and the retail lumber dealers of Rochester for the very pleasant reception they had extended to the Toronto visitors.

After luncheon the Toronto lumbermen were escorted to the Chamber of Commerce by Mr. C. C. Beehan, second vice-president of the chamber, and were shown through it, and entertained by the secretary and several of the members.

A visit was then paid to the Rochester Club, where Mr. Fletcher and Mr. Johnston acted as hosts, and entertained the visitors until it was time for them to return to their hotel.

At 8.20 the party left for Syracuse, N.Y., where they were entertained on Saturday morning.

The Syracuse Visit

The Syracuse programme commenced with a visit to the lumber yard of the firm of Mann & Hunter. The visitors were shown through the office and yard, and were greatly impressed by the excellent appointments and arrangements which they saw. This company carries a very extensive stock, which is all under cover, with the exception of the rough stock. It would be difficult to name any retail lumber yard which can excel that of Mann & Hunter for neatness, systematic arrangement, thoroughness, and all the other elements that enter into the successful conduct of a large retail lumber business.

After visiting this yard the Toronto dealers proceeded to the plant of the Franklin Motor Car Company, and were shown the process of manufacture of this excellent car. Every detail of the work was seen, from the assembling of the chassis to the testing of the finished car upon the neighboring hills.

The visitors were then taken in automobiles to the University of Syracuse, shown through some of its splendid buildings, and given an opportunity of admiring its large concrete stadium, which is capable of seating 37,000 people, and surrounds a full-sized football field.

The visitors then returned to their hotel, where they were entertained at luncheon by the Syracuse dealers. Mr. William A. Parkinson, of the firm of Mann & Hunter, occupied the chair. Addresses were delivered by Messrs. Robert B. Chapman, J. B. Reid, and H. Boultbee.

Mr. Chapman spoke enthusiastically of the value of co-operation among retail lumbermen, and told of the great benefits which the Syracuse trade had obtained from it. Mr. Reid delivered a similar address relating to the situation in Toronto. Mr. Boultbee told of the working of the Toronto Lumbermen's Credit Bureau and of the way in which it had enabled the Toronto trade to eliminate many of its former sources of loss.

After luncheon the visitors from Toronto boarded the train for the return journey, and reached Toronto at 9.30 on Saturday night. They had all enjoyed themselves so thoroughly that they discussed, during the journey home, the advisability of taking another trip in the near future.

Ottawa Retailers Organizing

A meeting of retail lumber dealers in Eastern Ontario was held at Ottawa on October 24, and organization arrangements were completed in connection with the representation of the Eastern district in the general Ontario Retail Lumber Association, for which an organization meeting will be held early in November. The visitors from outside points were entertained at a luncheon by the Ottawa Lumbermen's Credit Bureau. The proposed organization plan was discussed and approved, and the following committee was appointed to represent the Eastern district at the general organization meeting: E. M. Barrett, Ottawa, chairman; G. P. Davidson, Ottawa; George M. Mason, Ottawa; C. H. Walters, Ottawa; F. R. Anglin, Kingston; F. S. Macfarlane, Montreal; J. E. Lowey, Brockville; D. Carkner, Kenmore; W. A. Cheney Vankleek Hill, and C. R. Robertson, Ottawa.

Northern Ontario Retailers Organizing

A meeting of retail lumber dealers of Northern Ontario was held at Sudbury, Ont., on October 20 in connection with the proposal for the formation of an Ontario retail lumber association, with five local organizations in the different parts of the province. An organization of the Northern dealers was effected, the following officers being appointed: Howard Hessom, of W. J. Hessom & Son, Sault Ste. Marie, president; J. A. Laberge, Sudbury, secretary; Henry Knight, Burk's Falls; A. J. Young, North Bay, and Mr. McKinnon, of Knight Brothers & McKinnon, Cobalt, vice-presidents. These officers will represent the Northern association at the general organization meeting, which will be held early in November.

Toronto Wholesalers Planning to Organize

The Lumbermen's Section of the Toronto Board of Trade held a meeting on October 26 and inaugurated a move for developing more effective co-operation among the wholesalers of the city. There was a large attendance at the meeting, and a plan suggested by Mr. H. J. Terry was thoroughly discussed. At a previous meeting this plan had been approved in principle and left for fuller discussion at a subsequent meeting. Mr. Terry proposed that the wholesalers of Toronto, including the manufacturers doing a carload trade, should organize themselves, either as a branch of the section or otherwise, and hold monthly meetings, in the evening, following a dinner. This plan had already been adopted by the retailers of Toronto, and had worked out well. It would then be possible for the wholesalers and the retailers to hold their separate monthly meetings and to have meetings of the general section less frequently than at present, possibly once a month instead of once a week. This would make it possible for each branch of the trade to concentrate its attention upon its own particular problems, and for both of them to exert their influence in concert in connection with any matters of mutual interest.

The subject was discussed by all the members present, and the proposal met with everyone's approval. A committee was appointed, consisting of A. E. Clark (chairman), H. J. Terry, C. W. Wilkinson, A. E. Eckardt, and J. L. Campbell, to take the necessary steps towards getting the plan in operation.

The committee held a meeting on October 29, and arranged to hold a dinner of those engaged in the wholesale lumber trade on Friday, November 16, at 6 o'clock. It is probable that the dinner will be held in the Albany Club. Mr. A. E. Clark, chairman of the committee, will preside, and after the dinner the proposal to organize will be discussed in detail.

Dr. John Bates, superintendent of the Forests Products Laboratories of Canada, Montreal, has been appointed a member of a subcommittee on chemistry, appointed by the Advisory Council for Scientific and Industrial Research, Ottawa.

New Brunswick's New Timber Regulations

The Government of New Brunswick's order-in-council changing the stumpage rate charged for timber cut from crown lands and making the new rates effective from August 1, 1917, contains the following schedule:

For spruce, pine, and hackmatack sawlogs, per 1,000 superficial feet, $2.50; hardwood timber up to an average of 14 inches, per ton, $1.10; hardwood timber up to an average of 14 inches, per ton, $1.10; hardwood timber above 14 inches, additional per inch, per ton, 10 cents; hardwood logs, per 1,000 superficial feet, $1.25; pine timber up to 14 inches square, per ton, $2; pine timber above 14 inches, additional per inch, per ton, 50 cents; hackmatack timber, per ton, $1; spruce timber, per ton, $1.50; cedar logs, per 1,000 superficial feet, $2.50; railway ties, 8 feet length, each, 12 cents; hemlock logs, per 1,000 superficial feet, including bark, $2; white birch for spool wood, per cord, 65 cents; white birch logs for spool wood, per 1,000 superficial feet, $1.25; fir logs, per 1,000 superficial feet, $2; poplar logs, per 1,000 superficial feet, $2; and for all other descriptions of lumber not specified above, 15 per cent. of the market value thereof at the mill, place of shipment, or place of consumption in the province. Permits issued by the authority of the Minister of Lands and Mines to enable licensees to cut undersized lumber on barren lands or thickets will pay the same rate of stumpage as stated above, with the addition of 25 cents per 1,000, being the cost of supervision.

Toronto Wholesaler's Sudden Death

News of the sudden death of Mr. E. P. Sharp, of the Sharp Lumber Company, Toronto, on October 18, was a great shock to his many friends. Mr. Sharp's health had been poor for some weeks, and death resulted from apoplexy. The late Mr. Sharp had only been in the lumber business for about four years, but was widely known on account of his former business relations with many lumber firms in the capacity of an insurance broker, specializing in employers' liability and lumber insurance. He left this to become a member of the staff of Terry & Gordon, Toronto, as a salesman, and remained with them for about two years. He then became a member of the firm of Muir, Kirkpatrick & Sharp, Toronto, and, after a year with them, accepted a position as lumber purchasing agent with the firm of Bate & McMahon, contractors for the construction of Camps Borden, Leaside, and Mohawk. When this work was completed, Mr. Sharp opened an office in Toronto as a wholesale lumber dealer.

The late Mr. Sharp was 32 years of age, and is survived by his wife. At the time of his death he had completed arrangements for taking a rest in order to recuperate after the great strain of his work in connection with the construction of the military and aviation camps.

Car Service Situation Serious

The Special Railroad Conference Committee of the National Wholesale Lumber Dealers' Association of the United States report having received an important letter from the Commission on Car Service, Washington, D.C., in which the present car service situation and the outlook are outlined. The letter is, in part, as follows:

"Embargoes on shipments are the result of general congestion on particular lines, and, while conditions may be somewhat improved during the next few weeks, yet it is likely that when cold weather arrives, with its consequent slowing-down effect on the railroads, and with probable increased offerings of freight, the congestion may be of serious consequence.

"No one can actually forecast the extent to which the facilities of the transportation lines will be overburdened during the coming winter, but it is generally conceded that the increasing demands of the government will retard the handling of many classes of commercial freight.

"Embargoes and preferential orders will, of course, be based on the relative importance of commodities, and no doubt some classes of freight will be more or less delayed in movement. We cannot hope to eliminate these troubles, but the extent of minimization depends upon efforts of the carriers, plus detailed and individual efforts of freight shippers and receivers.

"One of the greatest factors in a condition of this kind is the prompt unloading of cars. It would surprise you to know the vast number of loaded cars held in various railroad yards and terminals waiting acceptance and unloading by consignees. Every car so held adds to the drain on facilities of the carriers. This commission, in conjunction with various sub-committees located throughout the country, is exerting every effort to reduce the accumulation of loads held for consignees, and asks the active co-operation of your committee of the National Wholesale Lumber Dealers' Association. If you will help us to control these accumulations the result will be equivalent to an extension in railroad facilities, and the benefit will be mutual."

The special committee, commenting upon this, say:

"It is quite evident from these advices that serious transportation difficulties will confront us, and it will be well for members to plan accordingly.

"We especially urge the necessity for full loading and prompt loading and unloading of cars."

England Expected to Increase Its Wood Consumption

Reports reaching the offices of the National Lumber Manufacturers' Association indicate that there will soon be an increase in the use of wood in England. When a timber controller was appointed last January as a war measure the consumption of wood was restricted in nearly every direction until an irreducible minimum seems to have been reached. During the past two years England has been living very largely upon its fixed capital, so far as wood is concerned, and little has been done to make repairs or erect new buildings. The railroad companies put off necessary work in the hope of better conditions, but this cannot be longer postponed. The construction of workmen's cottages must also go ahead, since many munition and other workers are homeless, while the great increase in shipbuilding and ship repairing is bringing an inevitable demand for more ship timber. At the same time the requirements of the British army for packing boxes and cases, furniture, light railways, aerodromes, and other buildings make a constant demand for lumber.

The conclusion of the English timber firms is, therefore, that the time has arrived when a larger timber consumption must take place, and that the government will act wisely if it allows a larger importation of foreign stocks.

Fifteen Per Cent. Rate Advance Case Re-opened in U.S.

The United States Interstate Commerce Commission has responded to the plea of Eastern railroads for financial relief by reopening the 15 per cent. rate advance case, so far as territory east of the Mississippi and north of the Ohio Rivers is concerned. The first hearing has been set for November 5 here.

In urging haste in the consideration of this case the commission opens the doors to the admission of testimony looking to a general advance in all rates east of the Mississippi and north of the Ohio Rivers. Railroads in the South and West have been showing a decrease in their earnings, and it seems, therefore, probable that the Southern and Western carriers will join in the request for an advance.

Lumberjacks Turned Back Near Border

A party of 27 lumberjacks, bound from Yarmouth, N.S., to a lumber camp in the State of Maine, were detained recently at St. John, N.B., by the immigration agent. Twenty-four of the party are between the ages of 20 and 45, and are being held under the Military Service Act. It is expected that those who are not liable for military service will be allowed to continue their journey. It is reported that the men are nearly all French-Canadians, who were hired by a representative of a lumber company of Jackman, Me., at Yarmouth, N.S.

B. C. Petitions for Shell Contracts

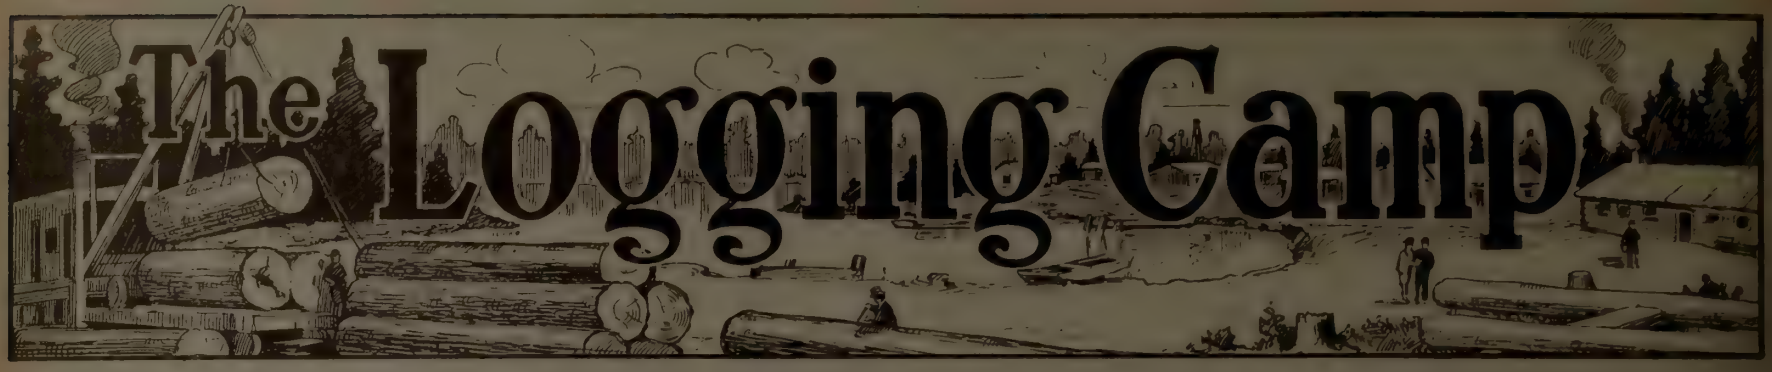
A petition has been forwarded to Sir Robert Borden by munition workers at Victoria, B.C., urging that further shell contracts be placed in British Columbia, on the ground that this kind of work should be provided for the dependents of those who have gone to the front and for returned soldiers. By the middle of November all shell contracts in the province will be completed, and about 2,000 men and women will be out of work unless new contracts are let.

Read Brothers, Limited, in New Quarters

Read Brothers, Ltd., wholesale lumber dealers, Toronto, whose office was in the Aberdeen Chambers, 43 Victoria Street, which was recently destroyed by fire, have secured new offices at 25 Toronto Street. Their new telephone number is Adelaide 870.

Mr. R. G. Chesbro, Traders Bank Bldg., Toronto, eastern representative of the Victoria Lumber and Manufacturing Co., Chemainus, B.C., who has been away from his office on account of ill-health during the past month, has returned to work, and his friends will be pleased to learn that his health is now greatly improved and that he expects to continue at his work without any further interruptions of this nature.

Capt. Gerald Davidson, cousin of Mr. Grant Davidson of the Estate James Davidson, Ottawa, Ont., has been promoted to the post of trench mortar officer of the Fourth Division. Capt. "Jerry" Davidson went overseas early in the war as a gunner. His promotion came quickly, first to the rank of lieutenant and later to that of captain.



Should the Cookhouse Show a Profit?

At the annual meeting of the Pacific Logging Congress, held recently at Seattle, Wash., a special committee presented a report upon the question, "should the cook-house show a profit?" The committee reported that the cook-house should show a profit, though very few had done so at any time, and practically none during the past year. Continuing, the report was as follows:—

With the great war, the I. W. W., the shipyard strike and numerous other questions of major importance to divert our attention, we trust that your committee may be pardoned if they have not given the cook-house the close investigation its contents warranted. There is some satisfaction in knowing that in the grievance list of the gentlemen who prolonged the Fourth of July vacation somewhat later than usual this season, there was little mention of poor food in the camps. Lack of whisky in the cities is said to have been a far more vital factor in extending the loggers' summer rest. Be this as it may, your committee is convinced by personal sampling of many menus that the general effect on the average logger is satisfactory, whatever the result to the owners' trial balance.

We had hoped to find several camps with well-settled menus of balanced rations with the calories duly set forth, but apparently modern methods of determining the value of a dinner have not been adopted, and we must refer anxious inquirers in this line to the domestic science department of the nearest high school. Conferences between the chef of a good two- or three-side logging camp and the instructor in domestic science or home economics, would probably disclose interesting differences of opinion. Fearing that your honorable body may think we are trying to dodge the question, we will now say that the cook-house should not make a profit. Very few have done so at any time. Practically none during the past year.

Logging is hard work and life in the open induces appetite. Camps generally are supplied much better than ten years ago with the best of meat, milk, vegetables, and with butter, eggs and fruit in generous quantity. At present food prices and board ranging from $6 to $7 per week, good management has been necessary to avoid actual loss. Here the personality of the cook counts for most, but the camp foreman or superintendent and the purchasing agent are important factors.

Every camp should have sufficient pigs to supply fresh pork as needed. No well-managed cook-house will fatten these pigs with the waste from the kitchen. It must be supplemented with cornmeal or other purchased feed, especially for a month before particular pigs are to be killed. This insures good pork without waste in the kitchen.

Many cooks err in placing too many varieties, especially of canned fruits and vegetables, on the table at the same time. It is far better to have a small number of dishes, well cooked, at a given meal with an entirely different menu next day for that meal, than to have appetite palled by a surplus without variety. The method suggested satisfies the men, lessens waste, and is easier for the cook-house force. Brains in the kitchen mean money in the office and satisfaction in the bunk-house.

A nominal profit on paper of $100 per month for a two-side camp is necessary to avoid actual loss. There is continual deterioration of utensils and dishes and the tendency is far too strong to charge replacement to camp equipment. The mattresses now supplied at most camps free, should be paid for by the cook-house. They require frequent renewal.

Twenty years ago the camp using anything but tin and iron tableware was a curiosity. Today it is difficult to find such ware in use. Granite and enameled ware are still common, but the best camps use heavy hotel stone china for table service and white metal forks and small spoons. Varnished fir tables, cafeteria style, are disputing the old white oilcloth in some camps.

Some camps serve hot soup and coffee with an otherwise cold lunch in temporary shelter at lunch time to outlying sides where it is difficult for the men to come in at noon and yet where the timber does not warrant establishing sleeping quarters and a regular camp. While this adds to the apparent cook-house cost, it increases the comfort and efficiency of the men and should mean a net gain for the company.

Some managers think it good policy to run the cook-house at a loss rather than charge sufficient to pay cost at times of high food prices. We believe the supposed offset of better men or possibly lower wages in such camps is a fallacy; $6.30 per week is the least that will suffice to pay all proper bills in a well-managed cook-house today. In many camps $7 is justified, though perhaps not advisable.

Our versatile secretary suggested to the committee so many ideas that if we reported fully this is the only subject the Congress could consider at this season.

As to rules preventing talking during meal hours, we know of no camp where such rule exists, or is necessary or advisable.

All modern camps have some room, warm and well lighted, where men may gather for recreation, reading and writing. Shower baths are installed in most camps and should be in all. There are few camp laundries. This work is usually done at the nearest town or by women near the camp. Most camps make no charge for mattresses or anything except board, hospital and personal clothing. The fewer special charges made the more contented the men.

It is not advisable that men should walk more than three-fourths of a mile from camp. If camp cannot move up let men be carried on train.

The following suggestion by Mr. Kenneth Ross deserves especial attention:

"We also think that the living conditions in the logging camps with reference to bedding, sanitary conditions, etc., should be standardized and strong committees of the various associations be appointed to see that whatever standardization is agreed upon should be strictly lived up to. I think in this way we would be able to eliminate a great deal of agitation that emanates from camps where little or no attention is paid to sanitation or living conditions of the men."

The above statement goes to the heart of much of the woodsmen's discontent.

The average cook will resent a menu directed from headquarters, but we believe there is a field for a camp cook-book with proposed menus covering two-week period, and to the production of such a work we commend the ambitious chef collaborating with the nearest home economics instructor. The task is beyond this committee. Meanwhile, until the book is forthcoming, the careful cook, the intelligent manager and the purchasing agent must consult frequently or the question will soon be not "Should the cook-house make a profit?" but "How can we reduce the loss?"

Steam Logging Methods in a Washington Camp

Logging operations carried on by the Danaher Lumber Company, near Darrington, Wash., are described in an interesting article by Fred H. Madigan, assistant engineer, in an article in the West Coast Lumberman. The operation consists of two camps. Camp No. 1, or headquarters, is located two miles north of Darrington, and will log all the holdings in Sections 6, 30, 31, and 36. This camp is equipped with two tree-rigged Lidgerwood skidders, each averaging about 3,000,000 feet of logs per month. The camp record made just before the July shut-down is 213,000 feet of logs yarded and loaded in ten hours by one of these skidders.

Camp No. 2 is located just east of Sauk Prairie. This is a one-side camp, equipped with a steel spar Lidgerwood skidder, and will log Sections 34 and 27. This camp was but recently opened, and has to date averaged about 2,000,000 feet per month.

Both camps are at present operating on ground that is practically level, and the timber averages close to 100,000 feet to the acre. In the spring both camps will be operating on steep side hills, in timber that averages 70,000 feet to the acre.

Two 80-ton Shay locomotives furnish the motive power, one being located in each camp. N. P. flats are used, empties being picked up and the loads delivered at the N. P. wye at Andron, one mile west of Darrington. This makes a two-mile haul from Camp No. 1 and six miles from Camp No. 2. The loads average 7,000 feet.

Will S. Taylor is superintendent, J. W. Martin is foreman of Camp No. 1 and Andrew Thompson is foreman of Camp No. 2. Joseph G. G. Morgan is chief engineer, with headquarters at Camp No. 1.

The first duty of the engineer is the planning of the setting ahead

of the yarding operation. For the tree-rigged skidders, the first consideraion is the selection of the spar-tree. The practice on the flat has been to split the forties, locating the spar-tree in the approximate centre, and logging the entire "40" from one setting. This gives a maximum yarding distance of about 1,000 feet. On the side hill the spar-trees will be close to 1,000 feet apart, thus bringing the maximum yarding distance down to about 800 feet.

The settings for the steel-spar skidder are between 800 and 1,000 feet apart, as the ground and timber conditions demand. The machine weighs 150 tons, so the setting must always be in a cut of two and one-half feet or better, to afford a solid foundation and prevent undue sinking. A short spur is run in parallel to the main line, and the skidder straddles the track on this spur. The cars are spotted behind the machine by the locomotive, and the empties are spotted beneath the skidder by the spotting gypsy and loaded in front. In this way the mainline is always kept clear, so that ties, ballast, steel, pile-driver, and any other material that may be needed in the "tall uncut" ahead can get by.

When locating the roads, the engineer curves only at the spar-trees, except where it is unavoidable, thus obviating the necessity of yarding across the track. When choosing spar-trees it is good practice to get them on alternate sides of the track. Where this is possible, the operator can fudge a little on the logs of the next setting, on the adjacent side of the track, and thus avoid the long, hard dray with the carriage line crossing the track at a very small angle and filling the cuts with debris.

In the location of both spurs and mainline, preliminary lines are run with the compass, chain and levels to the nearest tenth of a foot, save for turning points and bench marks, when readings are taken to the nearest hundredth of a foot. The compass is accurate enough for the preliminary work and is much faster. When a satisfactory preliminary line has been run, the final location is run in with the transit, chain and levels to the nearest hundredth of a foot taken from a level plug which is driven at each station on the line. Bench marks are established 1.000 feet apart.

All the section, quarter, and "40" lines have been re-run, and stakes set at each 100 feet, numbered from the nearest "40" corner. In this way the preliminary party has a ready check, and can correct any error before it becomes serious. Field notes always include data on where the line crosses a subdivision line, and the superintendent can tell at a glance just how the location is going without delving into a lot of technical details.

Vertical curves of 200 feet length or better are run in on all breaks in grade of 2 per cent. or greater, as the only additional cost is ten minutes' extra work on the part of the engineering crew. The advantages are the doing away with the danger of the cars uncoupling at a break in grade, and it is much easier on the rolling stock, especially a locomotive of long wheel-base. No reversed curves, other than turn-outs, have been run in to date, as we have always been able to squeeze out the forty feet of tangent necessary to give a car time to right itself. Compound curves have averaged two to the mile. Twenty degrees is th maximum curve, though we had to make it 22 degrees in one instance; 2½ per cent. is the maximum adverse grade, and 5 per cent. the maximum grade on main-line and spur alike.

In running the final locations it has proved good practice to set the point of intersection stakes, and reference points are established every 1.000 feet along the main-line. This is a very profitable precaution, as it then becomes a simple matter to run centres after the graders have gone by, or to run in additional spurs should occasion require.

The grading is done by contract. Cuts and fills of three feet and under are done by hand. Three to five feet are made by steam shovel alone and over five feet by steam shovel and dump cars in conjunction. The dump cars are operated by the chunk-out donkey. Two steam shovels are provided for this work, a 40-ton Marion and a 65-ton Thew "whirligig." The Thew is used for the wider cuts and for digging ballast. Fifty-six pound steel is laid on hewn ties, which are delivered on the right-of-way at 22c each. Pile, frame and stringer bridges are used as occasion demands. Superintendent Taylor is an advocate of stout two-pile 8-foot bents for heights of 10 feet and under, and the results attained have proved very satisfactory.

The Prince Albert Lumber Company, Prince Albert, Sask., and the Ladder Lake Lumber Company, Big River, Sask., are sending into the woods this winter about 3,600 men and 750 teams. They propose to cut 100,000,000 feet during the next twelve months and are operating 18 to 20 camps.

The Canadian Government has passed an order-in-council prohibiting the export from Canada of silver spruce (except under license) to all destinations abroad, other than the United Kingdom and British possessions and protectories. This step has been taken in order to protect the supply of this valuable wood for airplane construction.

Logging Railroad Construction

By James O'Hearn*

The first and most important step in constructing roads is the survey. The importance of topography has become recognized and maps have been made of most of the large tracts of timber. The approved method of taking topography is to run base lines one-half mile to one mile apart with transit or compass, chain and level, marking the stations and putting in bench marks frequently, thence running in the cross lines with pocket compass and aneroid, getting distance by pacing. Having the base line to check up on at each end makes this a very accurate and at the same time inexpensive method. The Abney level and the hand level are used by some engineers instead of the aneroid. If the aneroid is used the hand level is of great use as an auxiliary for determining slopes by taking side shots.

Maps are made with contour intervals of from 10 feet to 100 feet, depending on the roughness of the country and the scale of the map. An interval of 25 feet is good for most land and as a rule will show the country with sufficient detail. Relief maps can be used but ordinarily a good contour map will fill the requirements. Hatchures should be used sparingly, it being a great deal of work to make a map showing elevations correctly by their use, and unless they represent something definite on the map they should not be used. We have found them on many maps where, any further than showing the direction of slopes, they were useless.

The next step is the running of preliminary lines. These may be run with a staff compass, chain and level; with a transit using the vernier, chaining distances and leveling with an attachment on the transit, or with a regular level. The transit with the level attachment is considered preferable when the latter method is used. The instruments and the method used varies with engineers, and can safely be left to their judgment. No engineer will use a method by which he does not get accurate results with the least expenditure of labor. The average crew for preliminary work is three men—the transit man and two men to axe and chain. Should time be an essential factor, more men can be added, but it will be at the expense of added cost.

The preliminary line should be platted on paper having the subdivisions of land sketched on, accurately, if known, if not with standard subdivisions, which can be corrected from time to time as the work progresses, by means of tie-ons. The scale used should be large enough to give room for details—not less than one inch to one hundred feet. The number of each hub, the amount of angle, and the direction of each line should be given. Obstructions must be sketched in together with contours of five-foot intervals and extending far enough on each side of line to give an accurate idea of the ground.

Locating the Road

The location can now be made from the preliminary map. It can be run in with the transit, or if the preliminary line is near enough to the desired location, can be put in by offsets. The offset method saves much time and for spurs is accurate enough. If the tract of timber is of considerable size, it is better to put in the main line and main branches more with an eye to favorable grades and curves than to reaching a certain position in the timber. If these are put in well the short spurs will take care of themselves and the logs for most of their journey will have a favorable road. Grades and curves are relative terms and depend upon the country. In some tracts a 4 per cent. grade is heavy, in others it is light. Some camps can make a 12-degree curve the maximum, while others will have a 40-degree maximum. Engineering here depends on getting the best the country allows and making the equipment fit the road. Adverse grades should be avoided when possible. Of course, if the timber is in a hole you have to go after it, but the expense of operating mounts so fast that adverse grades should be the last resort. Velocity grades may be sparingly used but much velocity in handling logs is not recommended.

In breaking grade, we find that the break must not exceed 3 per cent. on account of the danger of cars coming uncoupled. The break should be rounded by the use of the vertical curve. On main lines grades should be compensated for curvature, but we do not deem that necessary on the short spurs.

Up to the present, most of the grading has been done by hand. Chunks are sawn up to such lengths that they can be rolled out with peavies, stumps are given enough powder to blow them in the clear, and the earth is cast, wheeled or carted in dump cars run by man power.

When rock is encountered, it is hand drilled and broken up by blasting small enough to be lifted into the wheelbarrows or cars. Camps getting more extensive roads are using power.

The first step forward consisted of sending a donkey ahead when the falling and bucking has been done and the stumps shattered with

---

* English Lumber Co., Mt. Vernon, Wash. An address delivered before the Pacific Coast Logging Congress.

powder to shunk out the right-of-way and make the larger cuts and fills by means of a steam scraper. The grading has to be sufficiently heavy to have this method pay. When cuts and fills do not run more than four feet and the chunking out is not exceptionally heavy, we have found hand work cheaper. In heavy work, steam shovels are becoming common and it is a forward step. In side-wall cuts they can waste the earth, while in heavy thorough cuts the earth must be hauled away, preferably by locomotives and dump cars, and can often be used in making fills. As rock work becomes more common, the need of a light, portable rock drill outfit is felt. These are being experimented with at present by manufacturers and will likely be on the market in the near future. The use of powder has become practically standardized, 20 per cent. strength being used for stumps, and from 40 per cent. to 60 per cent. strength—mostly 60 per cent.—for rock work.

Grading Costs

The cost of grading varies so much that figures represent little. Some spurs will cost but a few dollars per station, while others will run up in the hundreds. In looking over our records, we find one spur graded for $12.75 per station; on another we find a hard-pan cut with steam scraper cost $142 per station or 62 cents per yard. A pile trestle on the same line, 550 feet long by 45 feet high, cost $2.56 per running foot.

Fifty-five to 60-pound rail is in general use, It combines the requisite strength with weight such as may be easily handled by the ordinary section crew. Most of the steel laying is done by hand, though some camps are beginning to use cranes. The ordinary procedure in changing steel from one spur to another is to spot a flat car about 600 feet from the end of the spur to be picked up; the crew uses a push car, picks up two rails with the ties, runs up to the flat, transfers, and goes back for more. In laying, the operation is reversed. Camps fortunate enough to have a spare locomotive get much better results by discarding the push car and keeping the locomotive with the steel gang.

Ties are being made more nearly standard size than formerly. The makers used to think that anything was good enough for a log road. Camps that have mills in connection usually use sawn ties. Hewn ties made from split fir and cedar, and pole ties of fir, cedar and hemlock are used. Split fir and cedar are going out of use. They are made from No. 1 logs and these are becoming too valuable to split up into ties.

Split fir ties are usually made from old-growth dead trees, standing on some tract that is too scattering to log. They make a lasting tie, except that a good deal of the elasticity is gone from the timber and spike holes keep working larger until the rails are loose. Split cedar ties are too soft to hold spikes, especially on curves; also the rail will cut down through. When used on tangents with rail plates, they are probably the most lasting ties we have in the Northwest. Pole ties, if cut, peeled and allowed to season, are the best all round for logging purposes. On bridges, sawn ties 6 x 8 inches by 10 or 12 feet, surfaced one side, are used. Ordinarily ties are spaced 24 inches center. If the rail is light for the equipment, they are placed closer. Spacing on bridges is about 14 inches center to center.

In laying steel on spurs time is not usually taken to curve the rails to fit the curves, the rails being sprung with bars and spiked to place. On main branches it is much better practice to curve the rails to fit on any curve of more than six degrees. Curves on main branches should have not less than three braces per rail, and have more elevation than the ordinary speed tables would require. Curves of more than 12 degrees should have a guard rail; and all bridges, whether straight or curved, should be double guarded, the guard rails being placed about 12 inches inside of each rail. Track creeping on grades can be retarded, but not entirely avoided, by having track well ballasted and using slotted angle bars. Split rails are used at the foot of grades to allow the track to run by; it being considered safer to let it creep than to try to hold it and have it buckle out.

Gravel Costs

The Cascade district is made up of so many different formations and these are so well broken up and intermingled that nearly every camp can find one or more gravel pits where gravel can be secured for ballasting. Sometimes the gravel is hard to get but we must have it to have a track. We have hauled gravel for five miles up grades running from 2 per cent. to 8 per cent., being able to take but two loads per trip with a 60-ton locomotive, but figured it paid to do it. The gravel is loaded by hand, by steam scraper, by steam shovel, or in some cases where it is taken from the beach or river, by dredge. By hand is, of course, too slow, and must be avoided in operations of any size. The scraper will load gravel cheaply by making a trap to spot the cars under and having a reasonably long gravel bank to scrape from. The steam shovel is the ideal way and a camp of much size can ill afford to be without one. Costs are only relative, depending on so many factors that what would be cheap in one camp would be considered expensive in another. In miles and putting on 1,500 yards per mile the costs were:

Loading	12.2 per yard
Hauling, including fuel	17.0 per yard
Surfacing track	21.5 per yard
Total	50.7 per yard

or about $760 per mile. On another part with an average haul of two miles and putting on 900 yards per mile we find:

Loading	8.6 per yard
Hauling, including fuel	9.0 per yard
Surfacing	25.2 per yard
Total	42.8 per yard

or about $385 per mile. We loaded with steam shovel and hauled on Rodger's ballast cars and flat cars on which we put a sideboard that could be dropped to facilitate unloading. Figures given include only labor and materials actually used in the work, no depreciations or rentals for machinery used. Common labor at the time was $2.50 per day.

Maintenance of track will depend upon all that has gone before. If the grade is well built and ditched, good ties used, care taken in laying steel, and track well ballasted, the maintenance cost will be light. More attention is being paid to this part of the work and the five screeches of the locomotive calling the section crew does not resound through the woods quite so often as formerly. We consider we have an average logging track, yet in the first six months of this year out of 8,484 loads hauled we lost 31, as follows:

Stripped in hauling	6
Defective trucks account chains, king pins, etc., breaking	8
Defective track	6
Defective loading	4
Unknown causes	7

Our average haul after the woods switching is about 12 miles. It costs us about $1.50 per M. to pick those logs up again, besides time the yarding crews may lose and the breakage of cars. While we were fortunate in not having any personal injuries in connection with these, the danger is there. I do not like to stand up here and tell you what a poor railroad system we have but those are the facts—facts that we would like to, and hope to, get away from.

A New Forest Experiment Station

Following a recommendation by the Canadian Advisory Council for Scientific and Industrial Research, 100 square miles of the Petawawa Military Reservation, Ontario, has been set aside by the Militia Department as a forest experiment station, in co-operation with the Dominion Forestry Branch. This area comprises about two-thirds of the total reservation, all of which will still, however, be available for military purposes, so far as needed.

Petawawa is an artillery training camp, and a large portion of the reservation is ordinarily not needed for military purposes. It is situated in a typical white pine district, and was almost completely logged off before the land was acquired by the Dominion Government. There is, however, a fine stand of young forest growth, in addition to a limited amount of larger material.

A considerable amount of cordwood is cut each year for camp use for fuel, etc., and the Forestry Branch will supervise this cutting according to definite plans and will observe and record the results with a view to drawing conclusions as to silvicultural practice for the region, as far as practicable.

A party is now at work making a preliminary survey of the area set aside for forestry purposes. A type map will be prepared, and detailed studies will be made of volume and rate of growth, as well as of reproduction. It is hoped that scientific work of this character may be carried on from year to year and extended to cover other investigations appropriate to a regularly established forest experiment station.

The party now at work at Petawawa is under the charge of D. W. Lusk, who has been with the Dominion Forestry Branch for about three years, previous to which he was employed by the Laurentide Company, Ltd., of Grand Mere, Quebec. Mr. Lusk is assisted by four men, of whom two are returned soldiers. One of these, R. A. Courtnage, is an undergraduate of the Faculty of Forestry at Toronto University, who was a member of the Royal Flying Corps and was incapacitated for further military service by virtue of injuries received in an accident in England.

Mr. William Rutherford has been elected vice-president of the Win-the-War Electoral Association of Westmount-St. Henry, Montreal.

Making Winter a Season of Summer Profits

By F. B. Mendoza*

If he returned to life, what would be the fate of the party who started the notion among retailers that winter was a season of sickly profits If he were to see the change occurring within the last few years—if he were to learn of the cold weather protection campaign and the profits it has made for the dealer—he would choke with surprise exceeding that of Rip Van Winkle on his return home. The idea that the cold season is one of "dull" times and that it will always remain so is still as common as grass in the meadows.

The writer was commissioned to stray out among lumber yards in several states to determine the attitude of the average lumberman toward winter as a business period and, if possible, to dig up facts and details whereby the dealer could be helped by the service division. The results obtained are too numerous to describe in this brief article; however, a few will illustrate the mental trend of the average dealer.

In a certain city which we shall call X there are a very few industries. The population is twenty thousand. The dealers are temporarily handicapped because of the scarcity of carpenters, and so building is being retarded. Notwithstanding this, every man selling lumber advertises frequently and quite liberally. With one exception, they all believed that the winter would be a brighter season than last year. For downright practical optimism they have no betters.

The next morning a visit was made to a city forty minutes' ride from X, having a population slightly exceeding fifty thousand. Factories enjoying overbursts of good times were in evidence, and no one had to pity the unemployed, because of the absence of idle people. The first call was made at the office of an old-established firm, and there it was learned that people did not build to rent out, or bother with storm doors and sash, and that very few combination storm and screen doors were sold—winter was to bring us "bad, bad times," and the lumber business was bound for limbo, and so on and so on. Next a call was made at a yard five or six blocks up the street, and there it was stated that though business was not at its best, still there was a fairly good bit of it coming in. " Oh, yes; we sell combination storm doors and storm sash, now and then—expect to do more of it this winter," responded the gentleman interviewed.

Everywhere it was found that very, very few dealers had planned anything to meet the reduction of building usually characterizing winter wherever snow falls. There was one thing always in evidence which was especially pleasing, and that was the sight off "potbelly" stoves. One can picture certain gentlemen basking within the heat zone of these, instead of hustling around and rooting up orders for combination storm doors and sash, and stirring up orders for remodelling and alterations.

Most of the people interviewed were practical men—fellows with a reserve fund of "hoss" sense. They simply looked at present conditions from an old-time viewpoint.

The fact that not a great percentage of dwellings have storm doors and sash is what led to the present cold weather protection campaign for the dealer.

The average lumber dealer's indifference to public demand is one of the seven wonders of the commercial world. It is an indifference born of anything but fact. However, there is one fact from which none can escape: To the degree that the public is made to feel the necessity for a commodity in the same proportion will its sale increase. Illogical questions and arguments can be hurled at it; but, like all truths, it will stand up under the most brutal of bombardments. Study it from all sides and you will find it solid, massive, and impregnable.

The How, the Where, and the Why

There are but three ways by which the lumber dealer can make the necessity for combination storm doors and sash felt. He may solicit, circularize or advertise in newspapers. Let us analyze the last named.

The man who does not believe in newspaper advertising should be relegated to where things unusual and misshapen are displayed. While it is true that here and there can be found small-town newspapers charging rates out of proportion with what is moderate, yet it should not be thought that the small-town weekly is not a valuable medium. The advertiser in the smaller newspaper has the advantage of knowing practically all of its readers.

Advertising is education, though education is not always advertising. This was not so glaring a fact in the yesteryears, when advertisements were considered a thing apart from the news. To-day most people buy their newspapers and magazines as much for the advertising as for the news. From O'Sullivan we learned that leather heels jarred the spine. Heinz told us all about benzoate of soda long before Dr. Wiley and the Battle Creek fellows showed us the value of cereals.

As stated, the object in planning the cold weather protection campaign was to bring about a change—to induce the dealer to try it out and to prove to him that to the degree he makes felt the necessity for combination storm and screen doors and storm sash, in the same proportion will the sales of these increase.

Realizing the importance of the right kind of advertising, steps were taken to start the dealer off without involving his employing a professional writer. Copy was prepared for the nationally-read magazines telling the public about the new system in an interesting way, setting forth the need for such equipment from the standpoint of comfort and health as well as the saving which its installation effects. The tendency of this advertising is to create a demand for the cold weather protection—to place the public on speaking terms with this improvement, arouse their interest, and, roughly speaking, get them all primed for the finishing touches of the ambitious dealer.

Next, the advertising department was instructed to prepare newspaper advertisement copy and an artist was commandeered to furnish illustrations for these newspaper advertisements. Then, in order to complete the whole plan, this material, illustrations and all, was cast into electrotypes. These are now being distributed without charge, along with a goodly supply of envelope stuffers and a quantity of booklets describing the system fully, which are to be distributed among the dealers' prospects. In every case provision is made for the name of the dealer to appear on literature and other advertising matter.

But this was not all; the service division even offered to follow up the lumberman's prospective customers.

To round out the whole campaign, the editing and advisory end of the advertising department was offered to the retailer. He may now write his own advertisements and have them revised and laid out for the asking. This permits a wealth of freedom where the dealer feels certain that a particular kind of appeal, peculiar to his vicinity, will be more effective. It also allows him to have a wider range instead of confining himself to the ready-to-use advertisements. This service is also free.

The results have exceeded all expectations. Men engaged in the lumber trade responded from whom not a great deal of action or enthusiasm was expected. Others, in towns of small populations, requested the ready-to-use advertisements to be rushed. Another offered to pay for writing a small folder rather than submit his own copy in the rough.

Slowly but surely the dealer is realizing that he is the master of the situation, and that opportunities depend largely on how he creates them. He is awakening to the imperative need of educating the public to want commodities that have been slow sellers in the past. There is, indeed, a time to come when he will teach the public the economy and logic of building and owning their own homes and thus create sales possibilities for himself.

Last but not least, he will smile at the old, time-worn bogey of "dull" times in winter.

*Advertising Manager of the Morgan Sash and Door Company—reproduced from American Lumberman.

A Mail Order Deal

Down in Oklahoma the other day a man went into a store to buy a saw. He saw the kind he wanted and asked the price. It was $1.65, the dealer said.

"Good gracious!" said the man. "I can get the same thing from Sears, Roebuck & Co. for $1.35."

"That's less than it cost me," said the dealer, "but I'll sell it on the same terms as the mail order house just the same."

"All right," said the customer. "You can send it along and charge it to my account."

"Not on your life!" the dealer replied. "No charge accounts. You can't do business with the mail order house that way. Fork over the cash."

The customer complied.

"Now 2 cents for postage and 5 cents for a money order."

"What ——!"

"Certainly; you have to send a letter and a money order to a mail order house, you know."

The customer, inwardly raving, kept to his agreement and paid the nickel.

"Now 25 cents expressage."

"Well, I'll be ——!" he said, but paid it, saying: "Now hand me that saw and I'll take it home myself, and be rid of this foolery."

"Hand it to you! Where do you think you are? You're in Oklahoma and I'm in Chicago, and you'll have to wait two weeks for that saw."

Whereupon the dealer hung the saw on a peg and put the money in his cash drawer.

"That makes $1.67," he said. "It has cost you 2 cents more and taken you two weeks longer to get it than if you had paid my price in the first place."—Square Dealer.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

The New Plant of the Philadelphia Textile Machinery Co.

The new plant of the Philadelphia Textile Machinery Company, Philadelphia, Pa., manufacturers of the well-known "Proctor" veneer dryers, is modern in every detail, and all possible consideration has been given to the comfort and convenience of the employees. The plant is located on high ground, where plenty of fresh air, light and sunshine are available. The buildings are of an attractive colonial type, of brick and concrete, with white trimmings. A large building of two storeys is devoted to the offices, with private reception rooms on the first floor. The second floor contains a well-lighted drafting-room. This department also includes a dark room, with every facility for photographic work. In the basement of this building the company's important papers, contracts, and records are stored in a large vault. The various supplies for the offices are also kept in this department, in a systematic manner, which prevents any confusion.

The manufacturing plant is contained in a building 270 x 280 feet, located on the Philadelphia and Reading Railroad, which furnishes excellent shipping facilities. The company has a siding 280 feet long, running into the plant for its full length, from which machinery may be loaded and unloaded indoors. In this department the floor is on a level with the floor of the car. A track scale of 100 tons capacity is installed for weighing shipments, and a two-ton travelling crane is located over the siding, which will handle the heaviest loads.

The floor of the shop is laid with hexagonal creosoted wooden blocks, a type of floor which has been found to give the very best possible service and to be exceptionally easy on the feet of the employees. The plant is well lighted, having glass sides and skylights, which are so designed that no shadows are thrown in any part of the building.

The manufacturing operations are planned in a thoroughly systematic manner. The materials are unloaded on the receiving platform at one end of the plant and then are stacked in their proper bins at that end. From the bins they are routed down the floor of the shop on one side, through the various stages, and brought back along the other side, where the various finished parts are assembled and the machinery put together for testing before being taken apart for shipping.

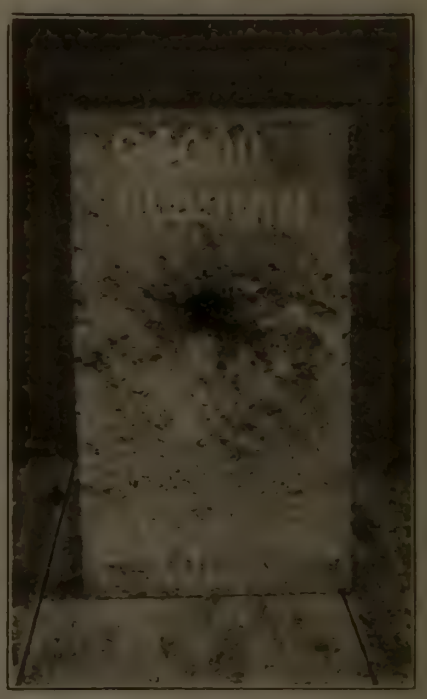
The equipment of the shop is of the latest improved types. In the centre of the shop there is a "planning" room, where the various jobs are routed as they come in, and are listed under the name of the man in charge of that particular job until it is completed. A special feature is the location of the emery grinding machinery in an enclosed room, equipped with suction tubes to remove the dust as it flies from the wheels.

The company also operates a well-equipped experimental department, where tests are conducted of the various types of dryers which they build and the effects secured under varying conditions. The whole plant is operated by electric power.

There are many other extremely interesting features of this modern plant which will commend it to all who are interested in modern manufacturing methods.

Testing Russian Shells

Few people know the methods used to test the ammunition being made in the United States for shipment to the Allies. One method in use by one of the Eastern cartridge manufacturers is interesting to sawmill men because this manufacturer takes a piece of Simonds saw steel and subjects it to a hail of bullets fired from a fixed distance from rifle and machine guns. The accompanying illustration represents a piece of Simonds saw steel after it had withstood an impact of 24,000 Russian bullets.



Fine new plant of the Philadelphia Textile Machinery Company, Philadelphia, Pa.

A Boiler Seam Protector

The National Boiler Protector Company of Canada, 910 New Birks Building, Montreal, are putting on the market the National boiler girth steam protector, which was patented in Canada in May last. The object of this device is to prevent trouble to seams in horizontal boilers, due to crystallization and fire cracks, caused by the intense heat concentrated against the seam. The protector consists of five sections, covering the circle seam. Each section being independent of the other, there is no interference due to contraction or expansion. Each section consists of a soft bronze wedge nut, which wedges between two rivet heads. The wedge is drilled and tapped for a ½ in. or ⅝ in. cap screw, and is so placed between the rivet heads as to come in close contact with the boiler shell, by which it is kept cool. The lug which the bolt supports is also in contact with the boiler shell. The fire-brick tile slips over the lug, covering the attachment, rivet heads and seam, fitting tight against the shell. The protector is as useful in new as in old boilers in preventing fire cracks and leaks.

Packard Company Establish Technical Training School

On account of the scarcity of skilled men in connection with the automobile industry the Packard Motor Car Company have undertaken a progressive move which is calculated to furnish a greater supply of this important class of employees. The company are opening a new technical service training school, the purpose of which is to provide technically-trained men for positions at field service stations and also at the factory. This school is open to all men who have had any automobile experience. Every man accepted will be paid while he is being taught, and when his course has been completed a position will be found for him in a Packard service station or at the main factory, and he will then be paid the prevailing scale of wages. This school is for men of the highest calibre only. The course will appeal to foremen in automobile factories and others who are ambitious for field service where the remuneration is greater.

The new Packard Technical Service School is divided into three parts. viz.: Mechanical training and underlying principles; mental training, to give independence of thought in solving service problems; and general training in business to give better perspective to the employee.

The Fuel Value of Wood

Persons who plan to relieve the coal shortage this winter by burning wood can figure, roughly speaking, that two pounds of seasoned wood have a fuel value equal to one pound of coal, according to experts of the United States Forest Service. While different kinds of wood have different fuel values, the foresters say that, in general, the greater the dry weight of a non-resinous wood the more heat it will give out when burned.

For such species as hickory, oak, beech, birch, hard maple, ash, locust, longleaf pine or cherry, which have comparatively high fuel values, one cord, weighing about 4,000 pounds, is required to equal one ton of coal.

It takes a cord and a half of shortleaf pine, hemlock, red gum, Douglas fir, sycamore, or soft maple, which weighs about 3,000 pounds a cord, to equal a ton of coal, while for cedar, redwood, poplar, catalpa, Norway pine, cypress, basswood, spruce, and white pine two cords, weighing about 2,000 pounds each, are required.

Weight for weight, however, there is very little difference between various species. Resin affords about twice as much heat as wood, so that resinous woods have a greater heat value per pound than non-resinous woods, and this increased value varies, of course, with the resin content.

The available heat value of a cord of wood depends also on the amount of moisture present. When the wood is green part of the heat which it is capable of yielding is taken up in evaporating the water. The greater the amount of water in the wood the more heat is lost.

Furthermore, cords vary as to the amount of solid wood they contain, even when they are of the standard dimension and occupy 128 cubic feet of space. A certain proportion of this space is made up of air spaces between the sticks, and this air space may be considerable in a cord of twisted, crooked, and knotty sticks. Out of the 128 cubic feet a fair average of solid wood is about 80 cubic feet.

This, however, applies to the standard cord, in which the sticks are cut to four-foot lengths and piled four feet high and eight feet long. Instead of buying the four-foot lengths, however, most people nowadays have the sticks cut into two-foot lengths by a gasoline saw. This results in a saving of both time and labor. The purchaser should, however, take care to see that he gets full measurement.

Where wood is to be burned in a stove or furnace intended for coal it will be found desirable to cover the grate partly with sheet iron or fire-brick, in order to reduce the draught. If this is not done, the wood is wasted by being consumed too fast, and makes a very hot fire, which in a furnace may damage the fire-box.

Kiln Drying Woods for Airplanes

When the United States entered the war the need for wood to build airplanes quickly created a difficult problem. Most of the air-seasoned wood available had been bought for airplanes for the allied nations abroad. Thorough air-seasoning of such stock requires from one to three years, according to the size and kind of wood. Kiln-dried stock under the methods ordinarily used has frequently proved unsatisfactory, and for that reason airplane manufacturers have been reluctant to use it. If the needs of the fighting forces were to be met adequately and without prolonged delay, it was essential that methods of conditioning should be available in which full confidence could be placed.

Long before this situation developed, the Forest Products Laboratory of the Forest Service, at Madison, Wisconsin, had been making a scientific study of the drying of wood, and had developed a method of drying which has been very successful with all the woods tried. Several kilns have been built at the laboratory for experimental purposes and a number of demonstrations made in commercial kilns. Ash and spruce are the woods most in demand for airplane construction, and, anticipating the present situation, the Forest Service secured a shipment of partially air-seasoned ash and spruce plank for preliminary tests.

This material was kiln-dried without injury. Later thoroughly green Sitka spruce, white ash (Northern and Southern), white oak, Douglas fir, Western white pine, and mahogany were secured in the log for testing. The spruce and ash logs were cut up and the green material from each species divided into three matched groups. One group of each species was tested green, another has been set aside to be tested when it has air-dried, and the third group was kiln-dried, trying several methods, and then tested. Only the results of tests on the spruce have so far been analyzed. Comparison with standard tests which had already been made shows that Sitka spruce can be kiln-dried from the green condition with no more—perhaps less—injury to its mechanical properties than by air-seasoning. Definite specifications have been prepared for kiln-drying spruce green from the saw for airplane construction, and, if rigidly enforced, they will insure kiln-dried stock of this species equal to air-dried stock.

A preliminary study of propeller construction has shown the need of such information on propeller woods. The testing of the ash and other species now on hand, which include several propeller woods, is being pushed as rapidly as possible, and there seems to be reason to expect as favorable results as for the spruce.

Ten Thousand Canadians in Forest Camps

Sir Edward Kemp, Minister of Militia, in a recent statement in the House of Commons, said that the number of men in Canadian forestry battalions overseas was at present as follows:

Battalion.	Officers.	Ranks.
224th Forestry Battalion	47	1,536
230th Forestry Battalion	30	1,038
238th Forestry Battalion	44	1,084
242nd Forestry Battalion	44	1,006
Total	165	4,664
		4,829
Drafts.		
Drafts from various districts	109	3,567
Drafts from the 230th Forestry Battalion Depot and not included in the 230th Battalion	40	913
122nd Battalion (converted upon arrival in England)	26	686
Total	175	5,166
		5,341
		10,170

In addition to the above a large number of men already overseas were formed into forestry companies.

The following special rates of pay are given specially qualified men after arrival overseas; these rates include regimental pay and field pay of $1.10 per day:

	Consolidated rate of pay.
Millwrights, two per company of 250	$3.00
Mill sawyers, two per company of 250	3.00
Edgermen, two per company of 250	2.25
Saw filers, two per company of 250	2.25
Engineers, two per company of 250	2.25
Log setters, two per company of 250	1.75
Cooks, two per company of 250	1.75
Saw hammerers, one per three companies	5.50

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) $2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Wanted

Large size Elm Logs wanted. Address P. O. Box 5, Papineauville, Que. 21-2

Wanted

4 cars Sawdust, 3 cars Spiles, 5 cars Hemlock or Cedar Ties, 2 cars Cull Basswood, 6 cars Cordwood, a number of cars Hardwood or Softwood Slabs. Apply Box 637, Canada Lumberman, Toronto, Ont. 20-23

Wanted—Lumber

Slabs and Edgings—Hardwood and softwood; five to five hundred cars, for cash. Box No. 641, Canada Lumberman, Toronto. 21-24

Maple Squares Wanted

Wanted to purchase for export in 1918 one million feet Maple Squares: 1¼ in., 1½ in., 1¾ in., 2¼ in., 2½ in.; lengths, 12 in., 18 in., 24 in., 30 in., 36 in., 42 in., 48 in.

State price air-dried and bundled f.o.b. cars. State shipping point. Box 625, Canada Lumberman, Toronto, Ont. 18-21

For Sale–Lumber

For Sale

200,000 ft. 1 x 4 and up Mill Run Spruce
200,000 ft. 1 x 4 and up, 6/11 ft. Mill Run White Pine.
150,000 ft. 1 x 12 in. 12/16 ft. Common and Dressing White Pine.
150,000 ft. 1 x 10 and 12 in. No. 1 White Pine Mill Cull.
150,000 ft. 1 x 7 and up White Pine Roofers.

The Elgie & Jarvis Lumber Co., Ltd.,
21-21 18 Toronto St., Toronto, Canada.

Lumber For Sale

300,000 ft. B.M. 1 x 4 and up Clear and No. 1 Spruce.
400,000 ft. B.M. 2 x 4 to 2 x 10 Spruce. Piled widths and lengths separate.

GEO. C. GOODFELLOW,
c Montreal, Que.

For Sale

A limited number of cedar Telephone Poles, 25 ft. to 35 ft. long. Also a few cars 8 ft. cedar fence posts, 4½ in. and up at top. For particulars apply Lynch & Ryan Lumber Co., Marmora, Ont. 18-21

For Sale–Machinery

For Sale

FOR SALE Log Loader, Type C, immediate delivery, attractive price, first class condition, made by American Hoist & Derrick Co.

J. R. BAXTER & CO., LTD.,
102 St. Antoine St.,
21-21 Montreal, Que.

For Sale

One 3-roll 52-in. Berlin Sanding Machine. Used only few weeks.

THE BEAVER BOARD CO.,
20-20 Buffalo, N.Y.

Slab Resaw For Sale

Heavy Horizontal Slab Resaw, Gidlings and Lewis Make, 6 ft. wheels, 8 in. saws; used only four months.

FIRSTBROOK BROS. LTD.,
20-23 Toronto, Ont.

Machinery For Sale

One 36 in. planer, roll feed, with countershaft.
One Jackson & Cochrane 24 in. planer, roll feed, with countershaft.
One 36 in. two drum sander, Cowan & Co.

R. W. NICHOLSON,
18-21 Strathroy, Ont.

Machinery For Sale

1 Goldie & McCulloch Engine, 16 in. x 38 in. Complete with Heater, Pipes, Oil Pump, etc. In first-class condition.
1 Holmes Matcher.
1 Band Rip Saw.
1 Dynamo Engine, Jewel No. 3.

R. Laidlaw & Co., 65 Yonge Street, Toronto.
19-21

For Sale

No. 5 Double Bale, Geared Screw, Power Shaving Baling Press, manufactured by the P. K. Dederick Sons, Albany, N.Y.

Capacity two bales, about 30 in. x 16 in. x 16 in., weighing approximately ninety pounds each per stroke of machine.

This machine has been in use but five or six months and is in first class condition.

It will be sold at a bargain.

THE DE LAVAL CO., LTD.,
19-22 Peterborough, Ont.

Box and Lumber Machinery For Sale, Second-Hand at Muscatine, Iowa

3—Dbl. Surfacers, 27 x 8, 30 x 12, 26 x 7, very fine condition.

Band Resaws

1—54-in. Gilbert, 1 60-in. Fischer, 1 72-in. Gilbert, 1 60-in. Fischer Db. Band Resaw.
1—No. 6 Chicago self feed rip-saw.
2—Morgan boxboard machines.
1—Fischer boxboard machine.
2—Morgan No. 8 lockcorner machines.
1—5 ft. knife grinder.
1—Morgan No. 1 setting up machine.
1—30-in. knife grinder.
Exhaust fans—1 60 in., 1 45 in., 1 36 in. All complete with piping.

Belting Shafting Pulleys Hangers

Cleveland Belting & Machinery Co.,
21-22 Cleveland, Ohio.

Wanted–Machinery

Refuse Burner Wanted

Second-hand Refuse Burner in good condition, 12 to 15 feet in diameter, and moderate height. Address with full particulars and price.

REAMSBOTTOM & EDWARDS,
20-21-22 Connaught Station, Ontario.

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

WANTED POSITION as trimmer man, air lift; five years' experience mill cutting, 150 M. daily. Address Z. T. Harlow, Crossburn, Nova Scotia. 18-21

YOUNG MAN, six years' experience as stenographer and bookkeeper in lumber business, desires change. Best of references. Box 629, Canada Lumberman, Toronto, Ont. 19-2

POSITION WANTED by an experienced lumberman thoroughly understanding woods and mill operations; eighteen years' experience; the last ten years as manager of logging and saw mill plant.

Want to go where there is further advancement for the right man.

Box 638 Canada Lumberman, Toronto, Ont. 20-20

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

WANTED An experienced young traveller, knowledge of lumber and the trade. Applications confidential. Box No. 639, Canada Lumberman, Toronto, Ont. 21-21

Competent experienced man to handle the sales of Quebec firm operating from the stump to planing mill wanted. Must have the best of references. Apply Box 640, Canada Lumberman, Toronto, Ont. 21-21

Business Chances

AGENCIES WANTED—French engineer having large established clientele, desires direct agency for France of labor-saving machinery of all kinds for wood and iron working, as well as factory equipment. Headquarters in heart of Paris, near the Opera. Write E. A. B., Room 444, 14 Phillips Square, Montreal. 21-22

Saw Mill For Sale

Complete Sawmill with timber rights and freehold lands for sale, excellent shipping facilities. Mill situated County of Shefford, with a visible supply of soft wood and hardwood timber in the neighborhood for an extended life. Address P. O. Box 222, Waterloo, Quebec. 16-t.f.

For Sale

Timber Limits and Sawmill, estimated fifteen million feet of hardwood and ten million feet soft woods. Sawmill capacity 25 M. feet, shingle mill 125 M. Docks, tug, booms, log going on ft, houses, etc. Price $35,000.

The Manitoulin Lumber Co., Ltd.,
11-22 Walkerville, Ont

Sawmill For Sale

Saw, Shingle and Planing Mill in Bayfield, on Lake Huron, will be sold at a bargain. Practically new and cost over $6,000, and will be sacrificed for $4,500 on easy terms. Plenty of available timber for this mill which will make more money than the best 100 acre farm in Huron County.

This is a gold mine for the enterprising man with small capital. Apply to

INO. B. MUSTARD,
19-22 Brucefield, Ont.

For Sale

[illegible] acres well timbered bush in township of Sinclair, new mill, stable and camps. Loading point, Huntsville. Reason for selling, ill-health. Apply to

HOLMSHEAD & ROGERS,
21-t.f. Huntsville, Ont

Mill Plant and Limits For Sale

43 Miles Limits on 31 Mile Lake, Gatineau Valley, containing Basswood, Spruce, Fir, Pine, Cedar, Birch, Maple and Pulpwood.

New Waterous 8 ft. Improved Double Cut Band Mill complete. Steam Alligator, Boats, Sleighs, Wagons, Harness, etc. For further particulars apply to

A. W. STEVENSON,
P. O. Box 2624,
8-t.f. Montreal, Que.

For Sale

About five or six tons of 5/8 and 9/16 tested chain in lengths from 27 ft. to 30 ft. with ring on one end and hook on the other end. Address Drawer "F," Sarnia, Ont. 19-t.f.

Tide-Water Stumpage For Sale or Exchange

For sale, or will exchange for good ranch or farm land, B. C. Tide-water stumpage, cruised and surveyed.

19-t.f. Peoria, Illinois.

Tenders for Timber on Lower French River Reserve

Sealed tenders, addressed to the undersigned, and marked on the face of the envelope "Tender for Lower French Timber," will be received until noon of Wednesday, November 28 next, for the merchantable pine, hemlock and cedar timber on the Lower French River Reserve in the district of Parry Sound.

Tenderers should state the amount of cash bonus they are prepared to pay for the timber over and above crown dues payable under sworn returns furnished by a licensed culler. The tariff of dues is as follows:—

Pine, $2.50 per M.f.b.m. or $25 per M.cu.ft.

Hemlock, $1 per M.f.b.m. or $10 per M.cu.ft.

Cedar, $1.50 per M.f.b.m. or $15 per M.cu.ft.

The rate of dues on timber taken out in other form than saw-logs can be had on application.

An annual license will be granted to the successful tenderer and five years will be allowed for the removal of the timber under the Regulations of the Department. A copy of such Regulations can be secured from the undersigned.

An accepted cheque on any Canadian chartered bank for ten per cent. of the bonus tendered should accompany each tender, the balance of the bonus to be paid within thirty days from the date of notification of acceptance of tender.

Any further information that is desired can be obtained upon application to the undersigned or to Alex. Logan, Indian Superintendent at Parry Sound.

The unauthorized publication of this advertisement will not be paid for.

DUNCAN C. SCOTT,
Deputy Supt. General of Indian Affairs.
Department of Indian Affairs,
Ottawa, October 20, 1917. 21-22

Timber Limits For Sale

Forty square miles of timber under license in the Townships of Thompson, Bright, and Bright Additional for sale.

License covers all classes of timber, except a few located and patented lots on which pine only is under license.

Limits are well timbered and well situated, between Thessalon and Blind River.

On account of death of one licensee and the absence of one overseas, these limits will be sold at a very reasonable price.

Full particulars on application to

H. L. Sargent,
Box 877,
Sault Ste. Marie,
Ont.

Dated 10th October, 1917.

TENDERS for Pulpwood Limit

Tenders will be received by the undersigned up to and including the seventeenth day of December next for the right to cut pulpwood and pine timber on a certain area situate in the vicinity of the Kapuskasing River in the Districts of Timiskaming and Algoma.

Tenderers are to offer a flat rate per cord for all classes of pulpwood, whether spruce or other woods. The successful tenderer shall be required to pay for the Red and White Pine on the limit a flat rate of $10 per thousand feet board measure.

The successful tenderer shall also be required to erect a mill or mills on or near the territory, and to manufacture the wood into pulp and paper in the Province of Ontario, in accordance with the terms and conditions of sale which can be had on application to the Department.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for Twenty-five Thousand Dollars ($25,000.00), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said Twenty-five Thousand Dollars ($25,000.00) will be held by the Department until such time as the terms and conditions of the agreement to be entered into have been complied with and the said mills erected, equipped and in operation. The said sum may then be applied in such amounts and at such times as the Minister of Lands, Forests and Mines may direct in payment of accounts for dues or for any other obligation due the Crown until the whole sum has been applied.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.
Toronto, September 19th, 1917.

N.B.—No unauthorized publication of this notice will be paid for. 20-24

Jobbers Wanted

We wish to let several contracts to take out logs on Berth No. 6, being broken front lying between the Magnetawan and French Rivers. This berth is all convenient to Canadian Northern Railway.

John Harrison & Sons Company, Limited,
Saw and Planing Mills,
9-t.f. Owen Sound, Ont.

Unusual Lumber Cargo

The Japanese steamer Somedono Maru left Portland, O., recently for Japan, carrying an unusual cargo of lumber, in that it was made up of timbers exclusively. It is understood that the Japanese buyers specified, in placing an order for the material, that none should go aboard the vessel with a diameter less than 18 inches. The result is most of the stuff is 24 inches in diameter and some 36 inches in diameter, with a percentage 36 by 40 inches. These timbers are intended for resawing on the other side, and in filling the order it is said the mills simply hauled logs from the water and squared them, cutting timbers as large as the logs permitted. The cargo measured about 3,200,000 feet, the best stowage not being possible because the material ran about 40 feet long, and it was impossible to fill the holds lengthwise. Had she loaded an ordinary lumber cargo the Somedóno Maru would have taken about 4,000,000 feet.

Forest Protection Improved

Over 2,500 settlers applied for and received permission to burn slash in Northern Ontario during the past summer and fall, under the operation of the new regulations based upon the Act of last season. While there are no statistics of previous years available, on which to base a reliable comparison to indicate the extent to which the new system is protecting the northern forests, the records of the past year show that very few of the fires that rangers have had to deal with can be traced back to settlers' fires. Under the permit system no settler can burn slash until he has received permission from a ranger, who must first satisfy himself that weather conditions and the location of the slash are such as to ensure against bush fires.

Order for Million Tent Pins

An order for a million tent pins for the United States Government has been given to the Springfield Planing Mill Company. Special equipment is now being installed to expedite the manufacture of these pins. Maple and ash will be used in their manufacture. The pins are to be 24 inches long. The company expects to get out about 10,000 pins daily. The pins will be shipped to San Francisco for distributioin. The company expects to take four months to complete delivery.

Review of Current Trade Conditions

Ontario

Unquestionably the most important feature, and the most serious difficulty, connected with the lumber trade in Ontario to-day is the freight car shortage. Canadian railroads are refusing to permit their cars to carry lumber outside of Canada. This is tying things up at mill points to a great extent, because probably 50 per cent. of the lumber on order at the mills in Ontario to-day is for shipment to the United States, and it is almost impossible to obtain transportation for these orders. United States roads, moreover, will not permit their cars to come into Canada empty, and only the comparatively small number of them come here filled with steel and other goods urgently required are available. A few cars of this class are going across the line, but in most cases they are carrying more valuable freight than lumber. The situation is being discussed by all exporting lumbermen in Ontario, and the opinion is expressed freely that there should be a means of arranging for the interchange of cars under such conditions as those which prevail to-day. Such an arrangement would have to be brought about by co-operation between the Board of Railway Commissioners for Canada and the Interstate Commerce Commission. Ontario wholesalers are looking with envious eyes upon the markets of the Eastern States, where they could sell large quantities of lumber if it could be delivered, and where they expect that there will be a good demand for Canadian stock for a long time to come.

General conditions at present in the Eastern States, as reported by Ontario wholesalers who have recently been across the line, are very similar to those which prevailed in Ontario during the latter half of 1915. House-building has almost come to a standstill. The United States Government and the steel and munition plants are using large quantities of lumber, such as Ontario can supply, and will be using still greater quantities in the near future. Even the United States Government is finding it difficult, and in some cases impossible, to get delivery of material when they want it. The natural result will be that a large quantity of lumber now in the yards at manufacturing points throughout Eastern Canada cannot be completely delivered before next spring. This is a strong factor in making trade conditions in Ontario unsatisfactory at present.

Local trade in Ontario is fair. The country trade is showing a little life, not so much as during active seasons in former years, but more than that of several years, not long before the war. The manufacturers in Northern Ontario all seem to be going into the woods this winter to a greater or less extent. They are not figuring on getting out their usual supply, because of the uncertainty in connection with market conditions, the high cost and inefficiency of labor, and the advanced prices of equipment and supplies. This will undoubtedly result in a reduced output next summer, which will be one of the important factors to regulate next season's trade.

The improvement which commenced in the Ottawa lumber trade about the last week in September still continues, and has been assisted materially by orders for shell boxes which were placed a short time ago by the Imperial Munitions Board. These orders amount to somewhere between 60,000 and 75,000 boxes and are included in three contracts. The result is a great deal of activity among the plants where the boxes will be produced. Employment will thus be given to about 220 men. Unfortunately, however, it is the general opinion that the prices for these boxes are exceptionally close, permitting of practically no profit. Manufacturers and wholesalers are having trouble with transportation. The Grand Trunk Railway is refusing temporarily to allow its cars to go out of Canada. Such shipments as are being sent to the United States are going over the Ottawa and New York Railway and the Canadian Pacific, together with a few shipments on foreign cars over the Grand Trunk. The shortage of labor in the woods is affecting manufacturers greatly and there is a belief that the output during the coming winter will be reduced, possibly by fifty per cent. Moreover, the cost of operating will be abnormal on account of the high wages and the high prices that have to be paid for all kinds of supplies. Ottawa prices show no important changes, though hemlock is a shade easier. Spruce prices continue very firm. The demand for mill refuse is very strong on account of the increased price of coal.

Eastern Canada

The demand for shipbuilding timbers at Montreal continues very strong. The Imperial Munitions Board has been taking so much of this kind of stock, however, that private concerns are finding it difficult to obtain supplies. It is even reported that the Board intends to put in some of its own camps in British Columbia, in order to make sure of an ample supply. Manufacturers and wholesalers are unanimous in expecting higher prices on account of the labor difficulties and the high price of supplies. Building operations are very quiet. Trade with the United States is still extensive, though a slight reduction in orders is reported. Shipments to the United Kingdom and South Africa are very light. The freight quotation is 500 shillings per standard. Space is very scarce as the government is loading all vessels with food stuffs.

The demand for spruce at Boston is still good, and much of it is for war purposes. The building trade situation is still very dull and retail trade is, therefore, quiet. Prices on dimension are firm and unchanged. Random is unsettled. There is a good demand for all sizes of spruce at New York. Large government orders are still to come, and there are signs of an improvement in the building situation. Manufacturers are holding out firmly for prices sufficient to cover their increased operating costs. The government demand for hemlock is still large and prices remain firm. Eastern clipped hemlock boards are a little firmer. Hemlock prices are firm at New York, and stocks are hard to get. There is an improved building demand from outlying districts. No improvement is reported in the market for shingles and lath at Boston, as dwelling house construction is very quiet.

United States

The United States Government continues to order in great quantities materials required for the war, and the demand for lumber for this purpose is still very large. The trade, however, is not quite as satisfactory as it might be, on account of uncertainty as to the extent of the price-fixing plan of the government. There are several other features leading to uncertainty, such as the fuel shortage, the labor scarcity, the war tax, etc. Fundamental conditions, however, are generally conceded to be sound. Money can be obtained at reasonable rates for legitimate undertakings. The crop prospects are exceptionally encouraging and general business is fairly active.

The Southern pine business seems to be on a better footing than it was a short time ago. Orders are increasing, but shipments are not as large as they were. The car situation does not look any too encouraging, there being signs of an increased shortage. This may not be a great evil, however, and one advantage of it will be that it will help to put an end to transit shipments. The market for ship timbers is extremely active, and is calling for large quantities of prompt deliveries.

The latest order commandeering long leaf yellow pine lumber for shipbuilding purposes includes all stock with a face width of 12 in. or more and a length of 24 ft. or more. The original order included timber 30 ft. and over. This makes quite a change; it releases stock with a face width less than 12 in., but it ties up stock 12 in. and over, even though it be only 1 in. thick. A large quantity of stock suitable for railroad and general industrial work will be released.

Trade in Western pine is light. Manufacturers, however, believe that they are in a strong position, and so are standing pat. The car situation in the West is unsatisfactory. Prices in general are firm. Manufacturers are exercising much caution on account of the uncertainty connected with the cost of operation. Most of the orders for Douglas fir at present are for ship timbers, special cutting bills, and for the railroads. The retail trade is very quiet. Stocks suitable for retail business, however, are scarce.

The hardwood trade, though possibly not so active as a few weeks ago, is good, and shipments are being made at a fair rate. Stocks in the North are badly broken, and, although operators intend to take out as many logs as possible this winter, it does not look as though they will be able to obtain as much as they would like, because of the shortage of labor. For these reasons Northern stocks are very firm. Somewhat similar conditions prevail in the South. A few price concessions are reported, though they are not of an important nature. This is probably the result of the greater number of small Southern firms with comparatively limited financial support. The market for Southern stocks, however, may be considered to be a good one, particularly for those who are able to go after and obtain business resulting out of the war.

Great Britain

London importers are practically at an end of their importing business, and have almost nothing of this nature to do, except to close out such transactions as are not yet completed. Firms which have gone in for the trade in home timbers, however, are fairly busy, particularly on account of the difficulties they experience in getting ship-

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

ment by the railways. Dock stocks, compared with those of former years, are considerably reduced, but, on account of the small demand, are probably sufficient to last until the reopening of navigation. There are fairly large quantities of mill-sawn and planed boards.

Imports of spruce deals at Liverpool during September amounted only to 200 standards, as compared with 6,240 standards in 1916. The stock at Liverpool on the first of October was only one-sixth of what it was a year previous, viz., 2,430 standards, as compared with 14,610 standards. Consumption shows a great decline, 40 standards having been used during September, as compared with 2,770 standards in September, 1916. There is no change to report in the general spruce market. New business is practically impossible under present conditions. The only subject of discussion is whether this situation can continue without starving the national requirements. On account of the great uncertainty which importers have to face, they are not able to give any consideration whatever at present to 1918 operations. Buying f.o.b. would be simply a gamble, according to the opinion of most importers, particularly in view of the increased figures that Canadian shippers are talking about, and which are the outcome of increased operating costs. The outlook is so uncertain that shippers do not care to commit themselves at present, as they are not able to foresee the extent of operations during the coming winter.

Manchester importers are giving a good deal of thought to the latest restriction on the export of all classes of goods to Sweden, Norway, etc. It is thought that his will have a far-reaching effect upon the timber trade. If no goods are exported, it is to be expected that no wood goods will come from those countries, and also that the rate of exchange will grow worse. This would be quite a serious thing for the Manchester timber trade, particularly as no goods are coming from Canada and other sources. Therefore, they are hoping that this restriction will not be maintained for long.

Business at Glasgow is quiet, and one week seems to be practically the same as those which preceded it. A few small parcels of spruce and pine have recently arrived from Montreal, but in the aggregate they do not amount to much, and practically do not relieve the great needs of the market. A fair enquiry is reported for spruce deals on c.i.f. terms, but it seems impossible to arrange for freight and insurance. Under present shipping conditions, it does not look as though stocks ready for shipment at Canadian ports will be sent across in any volume worth mentioning. The government is holding very considerable stocks and probably does not care to encourage competition.

Such transactions in pine as are reported are confined to small quantities from merchants' stocks, chiefly all third and fourth quality deals for shipbuilding and engineering purposes, but stocks of this kind all are low. The demand for Pacific Coast clear spruce for airplanes continues very strong, and such odd lots as come upon the market are quickly bought up, suitable specifications bringing high prices.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Trade More Active—New Shell Box Orders

Ottawa, Oct. 25.—(Special correspondence to the Canada Lumberman.)—A little more firmness has been noticed in the Ottawa lumber market during the past fortnight. The improvement commenced late in September, and the trade generally, so far as sales are concerned, appears to be good, with fair prospects. With the mills, however, the outlook is not so encouraging. The labor situation in connection with woods operations is becoming more and more difficult.

Transportation problems are giving the trade more trouble than formerly. Stocks for export to the United States have not been moving as freely as they were a short time ago. This is partly the result of the Grand Trunk Railway refusing, for the time being, to allow its cars to go out of Canada. The Grand Trunk explains that it is concentrating upon government business. Some shipments of lumber are reported from Ottawa to United States destinations over the Ottawa and New York Railway and the Canadian Pacific Railway. Shipments are also reported of foreign cars over the Grand Trunk line.

On account of the shortage of labor for woods operations a number of the mills will be obliged to reduce their cut. Two of the mills regarding which enquiry was made will reduce their cut by 50 per cent. The calling to the colors of the first draft under the Military Service Act is expected to reduce the supply of labor still further. At present there seems to be sufficient labor for the mills that are located at Ottawa. Enquiry leads to the belief that very few of the mills will file exemption claims on behalf of their employees.

The most important feature in connection with the manufacturing and woodworking plants, aside from the labor and transportation questions, has been the renewal of the orders for shell boxes. Three Ottawa plants have obtained new shell box contracts, the Estate of James Davidson receiving two orders for a total of 45,000 shell boxes, 35,000 of which are to be 6 in. shells and 10,000 4.5 in. shells. It is expected that these orders will keep the plant running until nearly Christmas and will give employment to about 100 men. This firm reports that there is not much demand for building materials, and that the trade in ordinary boxes for commercial uses is not sufficient to keep the plant operating to capacity. In its woods operations the Estate of James Davidson still require about fifty men. So far, in spite of the shortage of labor, this company have made satisfactory progress in their logging.

W. C. Edwards & Co. report that trade with the United States is continuing satisfactorily, although they are experiencing a good deal of trouble in connection with transportation. This company reports that the labor situation in the woods is very unsatisfactory. Their camps have not all been established as yet, and operations in the woods are behind time. Unless the situation improves, the company may not get out more than 50 per cent. of their cut of last season. The company is now finishing up some shell box orders, and has not received new ones.

The McAuliffe-Davis Lumber Company were among those who obtained new shell box orders, and they report that the market generally is steady. Their shell box operations will give employment to about twenty men.

J. Oliver & Sons, furniture manufacturers, who also obtained a new shell box order, will employ about 100 men on this branch of their work. Their factory is operating to capacity on furniture and shell boxes.

The Hawkesbury Lumber Company report that the supply of labor in the woods is only about half as large as it was a year ago.

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9 ft. wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. BRAZEL PLOWS cut 6 in. wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road, leaving a clean roadbed. Roll up and push entirely away from the road, 12 inches of loose snow each time the plow passes over.

Shingle Branch

West Coast Lumbermen's Association

Seattle (Henry Bldg.) Washington

Mr. Jackson C. Booth reports that the cut of John R. Booth during the coming winter cannot yet be estimated, but that he does not think any of the lumbermen will be able to get out as much as they did last year, as the necessary labor is not available. He attributes the labor shortage chiefly to the enlistment of woodsmen in railway and forestry battalions.

Three contracts containing four orders for a total of between 55,000 and 75,000 boxes have been given to Ottawa manufacuring and woodworking plants by the Imperial Munitions Board. The price on these contracts is very close. This new business will give employment to about 220 men. It is stated by people who are in close touch with the situation that the future of the shell box and munition manufacturing industry in Canada will depend more or less upon the success of the new Canadian war loan.

Prices are unchanged for good pine sidings, strips, and shorts. Although there does not seem to have been any definite change in pine prices generally, there is apparently a somewhat wider range between the low and high prices which one hears quoted. Spruce prices have continued firm, with a tendency to advance. One inch cull hemlock is easier. Lath also are easier. This is the result of the falling off in Canadian and United States building operations. Shingles show no change. In general, there is a fairly steady market, such alterations as are reported being of an unimportant nature and due to more or less momentary or local conditions. There is a great demand for mill refuse and cuttings for domestic fuel. On account of reduced mill operations this season the supply of fuel wood is not adequate to meet the demand, which has been all the more active on account of the increased price of coal.

St. John Mills Short of Logs

St. John, N.B., Oct. 26.—(Special to the Canada Lumberman.)—The last two weeks have seen positively no change in the lumber market at St. John. Stocks are not moving out any more actively than they were. There has been no reduction in prices, and the American demand has not shown any slackening. The only trouble is want of cars to move the material. This phase has not shown any improvement, and will not until the opening of the winter port, when many cars will come to hand loaded and will need refilling for their trip back to the United States. Only Stetson, Cutler & Co. and Murray & Gregory are now sawing at St. John. The other mills have shut down for want of logs. Men for the woods are extremely scarce, and it looks as if the cut must be very much reduced this winter. Logs are in good demand, at high prices never before offered, but, even at these prices, very few are being offered.

Montreal Markets—Ship Timbers the Chief Factor

Montreal, Oct. 26.—(Special correspondence of the Canada Lumberman.)—The situation has not appreciably changed. The demand for shipbuilding purposes is still very good, although it is not so insistent as a month ago. British Columbia timber continues to be the chief requirement, and with the British Columbia shipbuilding program in full swing there is little to spare for the East. The Imperial Munitions Board have set specified prices which they are prepared to pay, but the mills are so crowded with orders that the latter are demanding a premium of $5 per 1,000 for other shipments. A Montreal wholesaler who has just returned from the West states that the mills have all the business they can handle, and that Americans are bidding very briskly for any supplies that are available. The Imperial Munitions Board are putting in their own camps, and there is also the chance that they will commandeer a certain number of mills. Outside of timber there is very little demand for British Columbia wood.

Generally speaking, the opinion is that prices will go higher, not only on account of the smaller cut, but because of the increase in wages and in prices of commodities. There is, of course, the possibility of a serious decrease in the demand. With everything pointing, however, to buying on a fair scale, under the influence of war conditions, the chances are favorable to a still higher level of values. There is no reason to expect any revival in building locally, as builders state that the prices do not warrant extensive investments in bricks and mortar. The Builders' Exchange has under consideration means to reduce the cost of supplies, but it is questionable whether there is any hope of lower prices. Certainly in the matter of lumber the outlook is all the other way.

Trade with the United States is satisfactory, although a slight reduction in orders is reported.

Only a very small amount of lumber is going to the United Kingdom and South Africa. The freight quotation is 500s. per standard. More lumber would be sent were space available, but the government are loading up vessels with foodstuffs.

Sulphite is in good demand, while prices are lower as compared with the very high range recently obtained. Owing to importations from Sweden, the English market had a sharp drop. These imports have now ceased and quotations are stronger. A considerable amount of this pulp has been sent from Canada.

The Norwegian Pulp Market

A recent number of the Norwegian trade paper Farmand refers to the pulp market in the following words:

"Business in paper is very slow, with a great scarcity of orders. A crisis is imminent in the Norwegian cellulose industry. It is believed here that the Swedish Government has agreed to give licenses for the export to the United Kingdom of 120,000 tons of cellulose, and some surprise is expressed that shipments have not yet actually commenced. The British market appears, on the other hand, to have been very liberally supplied with Canadian and American chemical pulp, as our correspondents in London report. As a result there is presently hardly any demand from the United Kingdom, and, in any case, buyers expect Norwegian sellers to make very heavy price reductions. Owing to the enormously increased cost of production, to a great extent a result of the high coal freights, the Norwegian cellulose mills cannot go down to the somewhat enhanced Swedish level of prices without actually losing much money on each ton. Under these circumstances the market here for cellulose is at present quite in suspense, and no fresh business has yet been reported by which the value might be tested.

"The makers in this country of mechanical wood-pulp are not much better off than their colleagues in the other branch of the pulp trade. The absence of sufficient orders has gradually tended to a weakening of the current price to $16 f.o.b. This figure would have left a splendid profit in pre-war times, but, owing to the excessive cost to which logs have arisen and a general advance of all expenses, it is doubtful if the mills can make both ends meet with this price, particularly on a greatly reduced output. In order to prevent stocks from accumulating too much the mills belonging to the Wood-Pulp Association have agreed upon a very considerable reduction of the production.

"The wages tariffs for the Norwegian paper, cellulose, and mechanical wood-pulp mills have expired. The employers have made important concessions—the three-shift and additional war allowance—but these have been rejected by the men, and one must be prepared for the eventuality that the workpeople may be infatuated enough to carry the conflict to extremes, although the mills are already seriously considering the question of a temporary stoppage until market conditions improve somewhat.

"The outlook for the Swedish cellulose trade is not good. Apart from the uncertainty as to the embargo, it is highly doubtful whether it will be possible to get pulp from the Baltic shipped, and, like most of the Swedish industries, the cellulose mills suffer from want of raw materials, lubricating oils, etc."

An interesting reference to the sulphite pulp situation in Sweden is contained in a recent number of the "Paper Maker," in which Mr. S. C. Phillips writes as follows:

"I have always maintained that Sweden would have to abandon her hostile attitude towards this country, especially as soon as she was sure that Germany could not win the war.

"She views with alarm the great preparations Canada is making to capture a big amount of the sulphite pulp business over here, and that in itself has proved one of the strongest factors in bringing her into line. Sweden knows full well that so long as the war continues German can take an abnormal quantity of sulphite pulp for munitions at fancy prices from her; yet, when normal times come round again, she would need her old markets very badly, particularly if Canadian business developed, as it is threatening to do just now.

"Then, of course, Germany's cutting down of essential supplies to Sweden, such as coal, chemicals, etc., in exchange for various commodities she was so badly in want of, has opened her eyes wide to the selfishness of the Germans, and common sense, plus the instinct of self-preservation, has brought about a change of front which will naturally best serve the interests of the Swedes.

"In return for the removal of the embargo Sweden will get a certain amount of coal and other essentials, including food, she so badly wants now.

"The consequences of the removal of the embargo on sulphite wood-pulp from Sweden to this country is that wood-pulp prices were going down with a bang. In fact, the market is demoralized. Prices have declined from £50 to £35.

"Judging from reports which reach me from Sweden, the Swedish sulphite makers have got a very bad fright over the Canadian competition, and they have determined upon a strenuous attempt to smash the Canadian sulphite pulp trade at all costs; but in this the Canadians assure me that the Swedes will find themselves up against a very hard and difficult proposition.

"The whole top and bottom of the matter is that the Swedes have misjudged us all through this war. They have badly miscalculated the strength of the Allies, and have at last realized that they have had their money on the wrong horse. They find they have been backing the loser all through.

"Let Sweden frankly acknowledge her error and we shall be better and firmer friends."

Lumbermen's and Railroaders' Clothing

Guaranteed Pure Wool Mackinaw Coats, Pants, Shirts, Mitts Socks, Underwear, Etc., of the Highest Grades.

EDGINGS

Ontario

Work is about to start on alterations and addition to the mill of McLachlin Brothers, Arnprior, Ont. New machinery will be required for the lath mill.

The Northumberland Paper and Electric Company, River Front, Campbellford, Ont., recently lost their plant and mill by fire. The loss was fully covered by insurance.

Erickson & Co., Grand Marais, Ont., will take out between 10,000 and 15,000 cords of pulpwood during the coming winter on Edwards Island, which is east of Thunder Cape.

The plant of the Mattagami Pulp and Paper Company at Smooth Rock Falls, on the Mattagami River, has been completed and is ready for operation. The turbines have been tested and the installation is considered a successful one.

Mr. J. J. Carrick, M.P., Port Arthur, Ont., reports that erection of the pulp and paper mill which is to be located at Port Arthur in connection with the Black Sturgeon limits, recently purchased from the Ontario Government, will be commenced shortly.

The Ontario-Quebec Pulpwood Company, Ltd., has been incorporated, with head office at Toronto, Ont., and capital stock of $40,000, to carry on business as dealers in pulpwood, wood pulp, timber, etc., and as lumbermen, manufacturers of lumber, ties, lath, and shingles.

The Abitibi Paper Company announce that their pulp output has been doubled as the result of the completion of the new mill. In place of 65 tons a day, the sulphite plant is now turning out 130 tons a day, while at the same time the company's capacity of ground wood pulp has been increased to 300 tons daily.

The Bethune Pulp and Lumber Company, Ltd., has been incorporated, with head office at Toronto, Ont., and capital stock of $50,000, to carry on business as timber merchants, timber growers, saw millers, pulp and paper millers, etc. The provisional directors are J. L. Ross, A. W. Holmested, and L. B. Campbell, 20 King Street East, Toronto.

The Peterboro Lumber Company's extensive planing mill at Peterboro, Ont., was recently destroyed by fire. The company was running its plant overtime to meet with a heavy demand for material. It is believed that the fire originated from wire trouble in the motor room. The company have secured another mill for temporary use, and will be able to continue their business as usual. The loss was partly covered by insurance. It is understood that the mill will be rebuilt at once.

The Spruce Falls Pulp and Paper Company, Ltd., have been incorporated, with head office at Spruce Falls, Ont., and capital stock of $3,5000,000, to carry on business as manufacturers of and dealers in pulpwood, wood pulp, etc., and to operate pulp and paper mills, sawmills, and to carry on business as general lumbermen. The provisional directors are T. H. Barton, C. M. Garvey, T. M. Weatherhead, and A. V. Waters. Barton & Henderson, 904 Royal Bank Building, Toronto, Ont., are solicitors for the company.

Keenan Brothers, Owen Sound, Ont., are erecting a new building, which is now ready for roofing. The dimensions are 63 x 133 feet. The building is three storeys high, with an addition on the north end for office, elevator, etc. The addition is 70 feet long and 20 feet wide, three storeys high. The building is of mill construction, with 12 x 12 in. posts on the first floor and 12 x 14 in. beams. On the second floor the beams are 12 x 12 in., and one the third floor 10 x 12 in., with 10 x 10 in. posts. The lower floor is 2 in. hard maple, covered with 1 in. maple flooring. The upper floors are 3 in. Southern pine, covered with 1 in. maple flooring.

The Ballantyne Lumber Company, Trout Creek, Ont., have sold their limits in Ballantyne Township to Jacob Kaufman and Trussler Brothers, of Trout Creek, Ont. Edward Clark & Sons, Toronto, and Kelly Brothers, Bridgenorth, Ont., have sold all their interests in the Trout Creek Logging Company and the Dominion Wood and Lumber Company, Trout Creek, Ont., to Trussler Brothers, & Kaufman, Trout Creek. It is expected that the interests of the Ballantyne Lumber Company and the Trout Creek Logging Company will be combined in one company by the new purchasers, under the name of the Dominion Wood and Lumber Company. The former Ballantyne Lumber Company have reserved the 1917 cut of logs, and are now having them sawn at Trout Creek by the Dominion Wood and Lumber Company. These consist of about 2,500,000 feet of white pine.

Eastern Canada

The Canadian Franco Pulpwood Company, Montreal, P.Q., has been registered.

Bray & Gareau, Montreal, P.Q., have been registered. N. Bray and J. H. Gareau are interested.

The James Buchanan Lumber Company, Montreal, P.Q., has been registered. James Buchanan is interested.

Mr. J. A. Gregory, Grand Bay, N.B. (St. John River) is contemplating building a large tern schooner near his mill.

Fred J. Argall, 32 Des Forges Street, Three Rivers, P.Q., is making arrangements to organize a wooden shipbuilding company at Three Rivers.

Burns & Keller, Hailfax, N.S., are preparing to build a 500-ton schooner at Bayside, N.S., and it is expected that other vessels will be built subsequently.

The International Shipbuilding Corporation, Nordin, N.B., have begun work upon a plant for the construction of wooden vessels. The first keel will be laid in the near future.

The Comeau Shipbuilding Company, Ltd., Comeauvile, N.S., are contemplating the erection of a shipbuilding plant. J. W. Comeau is president and E. L. Comeau is secretary-treasurer.

Mr. D. Huntley, Parrsboro, N.S., has received a contract to build a schooner of 600 tons net on a 10 per cent. basis. The vessel will be built at Scott Bay, King County, during the winter.

A large stock of pine and spruce belonging to P. A. A. Dufresne & Frere, Ontario Street Montreal, was destroyed by fire on October 24. Fortunately only the front portion of the yards was affected.

Mr. R. E. Harris, Main St., Wolfville, N.S., is arranging to install a shipyard at that place. Old shipyard property has been secured on the east side of the creek, and work will start as soon as possible.

Fraser-Brace & Co., 83 Craig Street West, Montreal, are commencing work on the construction of a sawmill, shed, and blacksmith shop, at a cost of $7,500. The company have important contracts for wooden shipbuilding.

Rafuse Brothers, Bridgewater, N.S., have purchased the premises and yard of the estate of J. McGill, Shelburne, N.S., and intend to install a shipyard at that place. They are also associated with Messrs. Foley, Salmon River, in building ships.

The Acadian Shipbuilding Company, Ltd., are contemplating the erection of a shipbuilding plant at Saulnierville, N.S. The president is F. E. Comeau; manager, E. P. Comeau, and secretary-treasurer, D. D'Entremont, Meteghan River, N.S. Work preparatory to building has commenced.

Veneers and Panels, Ltd., with a capital of $500,000, are constructing, at St. Jerome, P.Q., a factory for the manufacture of veneers from Canadian hardwoods, including birch, maple, elm, beech, ash, and also basswood. The company, of which Mr. H. Lefeber is manager, hope to have the plant ready in the spring.

La Manufacture de Seaux et Boites de Trois-Rivieres, Ltd., has been formed, with a capital of $99,000, to manufacture and deal in lumber, logs, pulpwood, wood pulp, shingles, and paper; to manufacture and deal in pails, barrels, and boxes of all kinds; to acquire and operate mills; and to hold and operate timber cuts and limits. Messrs. L. Gilbert and O. Gilbert, D'Israeli; Lionel Trudel, Montreal; N. Chenevert and T. A. Gilbert, Cap de la Madeleine, are interested.

Western Canada

The McDonald-Dare Lumber Company, Ltd., Winnipeg, Man., recently suffered loss by fire.

The Barr Springate Lumber Company, Ltd., has been incorporated, with head office at Shaunavon, Sask., and capital stock of $100,000.

The Dome Creek Lumber Company, Ltd., has been incorporated, with capital stock of $15,000 and head office at Dome Creek, B.C., to carry on business as lumber merchants, sawmill proprietors, timber growers, etc.

The Alexa Lake Mills, Ltd., have been incorporated, with head office at Aleza Lake, B.C., and capital stock of $25,000, to carry on business as timber merchants, sawmill proprietors, lumbermen, and shingle manufacturers, etc.

The Smith-Dollar Timber Company, Ltd., has been incorporated, with head office at Vancouver, B.C., and capital stock of $50,000, to carry on business as manufacturers of and dealers in lumber and shingles, shingle mill and sawmill owners, loggers and lumber merchants.

The Mankin Lumber and Pole Company, Ltd., has been incorporated, with head office at Hall, B.C., and capital stock of $100,000, to purchase and operate the sawmilling and lumber and pole business, plant, etc., of the Mankin Lumber and Pole Company. The new company will also carry on business as timber and lumber merchants, sawmill proprietors, and pulp manufacturers.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 28th day of November, 1917, for the purchase of License X361, to cut 6,290,000 feet of Douglas fir, hemlock, cedar, and spruce on an area situated on Agamemnon Channel, N.W.D. Three years will be allowed for the removal of the timber. Further particulars may be obtained from the Chief Forester, Victoria, B.C.

Mr. Gustave Ste. Marie, late chief clerk for the Redfern Lumber Company, Montreal, died on October 22. Mr. Ste. Marie, who retired a few months ago, was connected with the firm for thirty-four years.

Major Austin Taylor, of the Montreal Locomotive Works, has been appointed by the Imperial Munitions Board director of aeronautic supplies in British Columbia. This is particularly in connection with a supply of suitable spruce for aeroplanes in Canada and Great Britain.

Install a "By-Pass" Exhauster
in your Saw Mill, Planing Mill or Plant

Our "By-Pass" Exhaust systems save your power and give better service. They handle green sawdust or wet, stringy material that usually clogs up an ordinary Blower system. The fan wheel is not overhung. No heating, clogging, or shaking. Three bearings.

Write for information.

We manufacture and install systems complete.

Toronto Blower Company
156 Duke St., Toronto

Canada is Now a Creditor Nation

Help Her to Maintain this Position By Subscribing for Large Blocks of

Canada's Victory Bonds

It is for you, manufacturers and merchants, to give the lead to those whose daily lives you influence, by subscribing for a substantial block of Canada's Victory Bonds.

The simple fact is, Canada must have more money to carry on her part in the war and extend credit to Great Britain and our Allies.

This Canada must do if our industrial, commercial and agricultural activity is to be maintained.

Since Canada can no longer borrow abroad, the money must be secured here.

Fortunately the money is here. It only remains to get the hundreds of thousands of people with savings to realize what it means to Canada—to them—to you—to insure the success of the Loan.

By subscribing for Canada's Victory Bonds yourself, and tactfully explaining their merits to your employees—you can insure the Bond issue becoming an overwhelming popular success. This Canada relies upon you and every other manufacturer and merchant to do.

So surely as Canada's Soldiers in the Front line trenches are fighting for Freedom, so in a lesser degree do they fight who lend their money to support Canada's Armies in the field.

Money fights to-day, and it is the bounden duty of every Canadian to back Canada's part in the war by buying Canada's Victory Bonds.

Decide now that your concern will take a big block of Canada's Victory Bonds and that your whole establishment will be organized in support of the Loan.

Issued by Canada's Victory Loan Committee in co-operation with the Minister of Finance of the Dominion of Canada.

Logging Machinery

Will handle logs from the stump to the car or water more speedily and at a lower cost than man and horse power alone. Write us for particulars regarding our

Skidding Machinery ***Loading Engines*** ***Derricks and Derrick Irons*** ***Cars and Car Irons***

and other labor and money saving machinery for Lumbermen

MARSH & HENTHORN, Limited, BELLEVILLE, Ont.

A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent. than any other belt. They are made from skillfully selected hides with the stretch taken out of each section before it is made up into the belt.

According to the conditions under which the belt is to run, we recommend "Extra," "Standard" or "Acme Waterproof" belts.

Send for further particulars and prices.

Winnipeg Agents—Bisset & Webb, Limited, 151 Notre Dame Ave. East, Winnipeg, Man.

GOODHUE BELTS

J.L. GOODHUE & CO. Limited.

DANVILLE — QUEBEC.

YOU NEED "LITTLE DAVID"
FOR WOODEN SHIPBUILDING

— MORE WORK AND LESS WORRY —

The "Little David" Wood Borer is the "Shipbuilders' Wood Boring Machine," because it is light, powerful and speedy, and above all, simple and durable.

It is made in three sizes, the smallest boring holes in wood 1″ diameter and under, and the largest, 4″ diameter and under.

All sizes are reversible, and the cases are of aluminum with steel bushed cylinders. This explains why the largest size is about ten pounds lighter than any other wood borer of equal capacity.

We have other labor-savers for wooden ship work, such as the CC-101 Drift Bolt Driver, Pneumatic Hammers adapted for trenail driving, and Pneumatic Tools for horsing oakum, etc.

Our nearest branch will be glad to give you full information, and to send bulletins, etc., at any time.

TIME

You can't see it or feel it but you can buy it and lose money on it if you don't measure it with an

International Time Recorder

The most important factor in present day business — TIME — comes in for least accounting.

You pay a man so much a day, or so much an hour, or so much for a job. Can you accurately tell how much time he gives you for your money?

International Time Recorders will do this for you with cold blooded, machine like accuracy, and will leave no loop hole for argument or dispute.

There is an International for every labor problem, and for every class of work. They are installed and relied on by the largest concerns in the world, as well as "one man" plants.

They do not actually "cost" you a cent. In a short time the initial expenditure will be returned to you in time saved, in accurate records and more satisfied employees.

Shingles and Lath

Shipment by car, canal boat or cargo.

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

Douglas Fir
Red Cedar Shingles
Hard Pine
Maple Floors

We manufacture Spruce at our own Mills at Portage, Maine, U. S. A., and therefore we know what big prices mean to the manufacturer

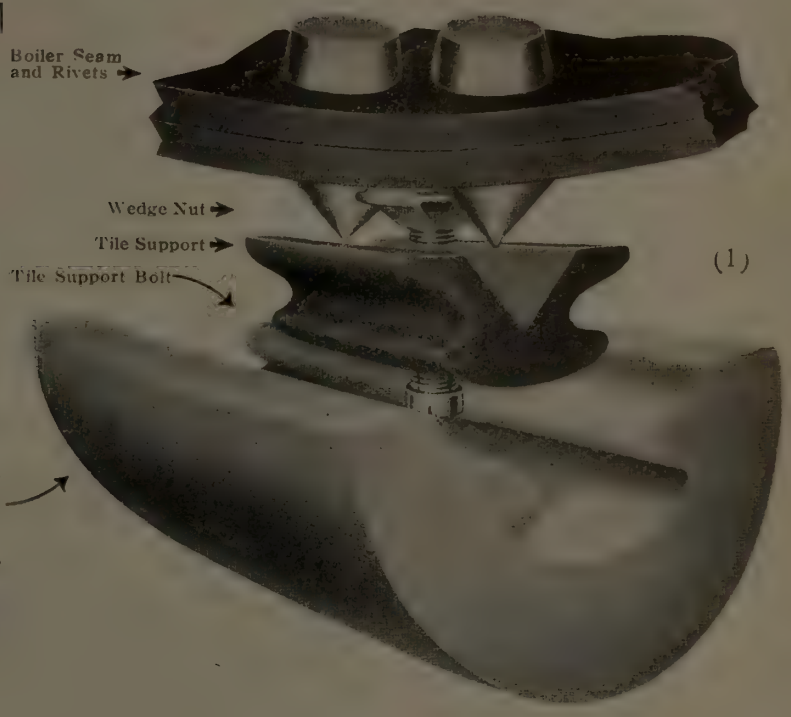
THE NATIONAL BOILER GIRTH SEAM PROTECTOR

An Absolute Prevention Against Mud Cracks, Fire Cracks and Leaks on All Boilers



(1)

This Protector has proven its merits under the most severe tests and is guaranteed for two years.

The National Girth Seam Protector will prevent fire cracks at the seams and between rivets, and thereby eliminate costly repairs and loss of time through leaks.

If you are now using H. T. Boilers you are aware that the seam is a great deal of trouble, owing to crystallization and fire cracks. The lapping of the plates makes the distance from the inside of the boiler too great for the water to keep the outer lap sufficiently cool; therefore the constant opening and shutting of the fire doors allows the cold air to rush in the fire box, causing variation of temperature which results in violent expansion and contraction of the outer laps. The Protector prevents this.

If you have fire cracks or leaks caulk them up, put on a Protector and the seam will remain absolutely dry thereafter.

Hundreds Have Been Installed on Stationary Locomotive and Marine Boilers

The National Girth Seam Protector is endorsed by Engineers, Boiler Inspectors and Insurance Companies.

A few large users of the National Protector in the U.S.A. and Canada:

United States Government.
Carnegie Steel Works (Homestead) Pittsburgh.
Standard Oil Company.
Imperial Drop Forge Co., Indianapolis, Ind.
United Paper Board Co., Evansville, Ill.
Borden Milk Co., New York.
Dominion Copper Products Co., Montreal.
Howards Smith Paper Mills, Beauharnois.
And hundreds of others.

All new boilers should be protected; prevent your boiler from becoming fire cracked by putting on a National Boiler Protector.

The illustration above (1) shows one complete section of this National Protector. Five such sections make the National Boiler Girth Seam Protector shown in place at the arrow tip in the lower illustration (2).

So simply constructed is this National Protector that any fireman can attach it in 30 minutes.

BELTING IS MACHINERY

Belting isn't an accessory to machinery—belting is machinery. Buy a belt just as you buy a machine. The right belt takes up all the power; carries all the power; delivers all the power.

For every drive there is **one** right belt. For example: Graton & Knight Spartan, an extra-durable leather belt, is standardized for difficult saw mill work, overload drives, or exposure to steam, heat, oil, or other adverse conditions—Graton & Knight Neptune, standardized for damp and wet places—Graton & Knight Heart, GraKnight, and GraKnight Dynamo, the standardized extra heavy, medium and light weight oak-tanned center stock belts respectively.

And so on, through the whole gamut of power transmission, there is a Graton & Knight Leather Belt that is standardized for each and every belting job.

Don't try to save money by cheapening your belting—the right way, the profitable way is to **Standardize** it. A Graton & Knight Belt Expert will show you how to put the right belt to work in the right place. Let us send him to see you—there's no obligation.

FISHER & DAVIS MFG. CO. St. Louis, Mo.

FIRE BRICK

For Refuse Burners, Boiler Settings, Kilns, Dutch Ovens, Etc.

We make a special brand of Fire Brick for each separate condition. Our many years in this field proves our ability to market a product that will support our good reputation. You want to get the most out of your business. Pay careful attention to this vital part of the plant. Write us the nature of your requirements. We will go into the matter carefully with you

"Elkco Special," "Elk Steel," "St. Marys," "Keystone" and "Rotex"

and advise on the best methods of construction. At any rate, send for our catalogue. It will be of great interest when you are considering the use of Fire Brick in any form. Many of the most important industries in Canada are using one or more of our brands of Fire Brick. We would like to have you know what they think of our product.

ROCHESTER, N. Y.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

CLIMAX Improved Geared LOCOMOTIVES FOR WOOD AND IRON RAILS

A 62-ton Climax Locomotive Designed Especially for Heavy Logging Work.

Climax Locomotives are successfully operated on steep grades and sharp curves. Any weight or gauge. Locomotives in stock for immediate shipment. Get Catalog "H."

MANUFACTURING WOODWORKING

Machine Knives, Circular Cutters and Mortise Chisel

Lath Machine and Bolter

This machine is a combination of our No. 2 Bolter and No. 2 Lath Machine mounted in a single frame. The lath machine is made the opposite hand to our single machine. The illustration shows the lath machine side of the combination. In mills where the floor space is limited and the output must be large this machine is an ideal combination. The details of construction found in our No. 2 Lath Mill and No. 2 Bolter apply to the combined machine.

When you overhaul your mill get in touch with us about new equipment

Waterous Boilers

Are Best for Sawmill Use

To get the full steam value out of the fuel you burn install Waterous Return Tubular Boilers. It will pay you for these reasons:—

They are economical of fuel. They carry plenty of steam in reserve for use in emergencies. They can be used with hard and dirty water. They are easily cleaned and readily taken care of.

Furthermore, We design and supply the fittings for various styles of boiler settings that are suited to best handle the fuels used in the sawmill, giving great efficiency and perfect combustion.

We build and carry in stock Return Tubular Boilers up to 72" x 18 ft. If we cannot supply you at once from our yards we can turn out your order in reasonable time. Ask us for prices on the next boiler you buy.

"FROST KING" METAL

$5,000,000.00

worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

HOYT METAL CO., Toronto, Canada

Have factory and office at Eastern Avenue and Lewis Street, Toronto, Canada

Factories also at:— New York, N. Y. London, Eng. St. Louis, Mo.

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

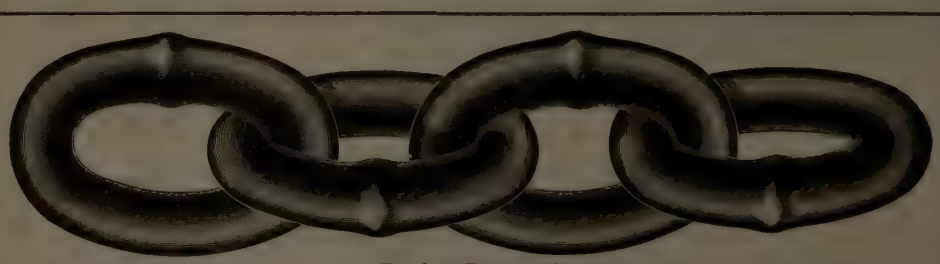
McKinnon Electric Welded Chain



Design Patented

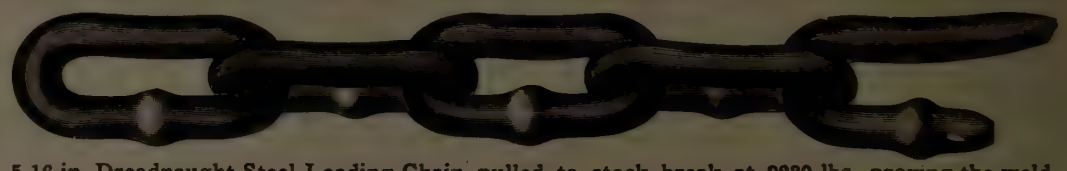
25% Stronger

A chain is as strong as its weakest link. McKinnon Electric Swell Weld Chains are welded and formed on automatic machines. These machines absolutely ensure a perfect joint. 25 per cent. more stock is used at the weld to strengthen the only possible point of weakness. Therefore, the Electric Swell Weld is actually the strongest part of the chain.

The material used in the manufacture of these chains is the highest possible grade of steel—special analysis to meet our requirements. Every pound of chain is actually proof tested before being shipped.

McKinnon Electric Weld Chains are sold to you under an absolute guarantee of weld perfection. We will replace any chain free of charge if it breaks at the weld.

Chains replaced if break occurs at the weld



5-16 in. Dreadnaught Steel Loading Chain, pulled to stock break at 9230 lbs., proving the weld the strongest part of the link. Tested at Syracuse University, September 27, 1912.

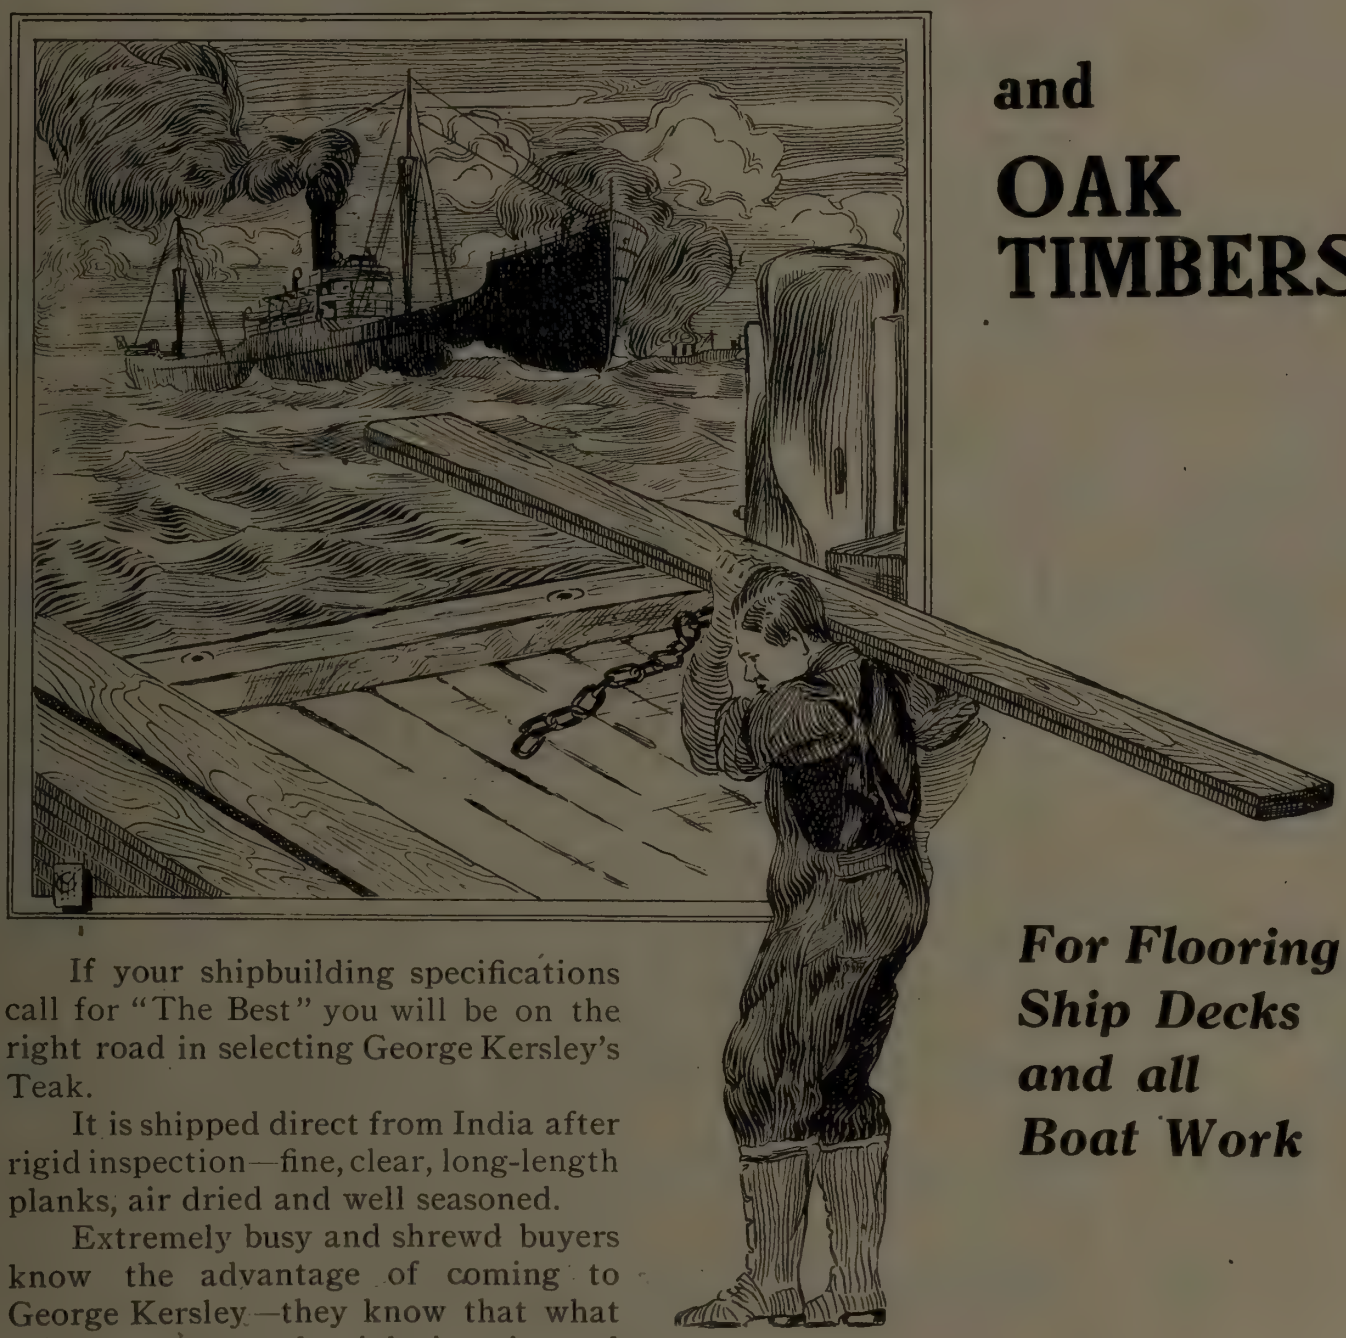
Made in Canada by

McKINNON CHAIN CO. St. Catharines, Ont.

George Kersley's TEAK

and

OAK TIMBERS



For Flooring Ship Decks and all Boat Work

If your shipbuilding specifications call for "The Best" you will be on the right road in selecting George Kersley's Teak.

It is shipped direct from India after rigid inspection—fine, clear, long-length planks, air dried and well seasoned.

Extremely busy and shrewd buyers know the advantage of coming to George Kersley—they know that what he passes on must be right in price and quality—they know that the ultimate result will be economy in time and money.

This is characteristic of all Kersley's timbers—MAHOGANY, OAK, POPLAR and BIRCH. "It must be best." That's Kersley's motto.

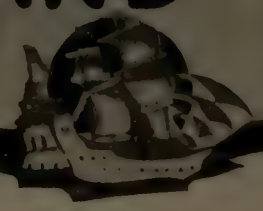
DISSTON
SAWS AND TOOLS



Cutting Forests into Fleets

WE are building ships as we never built ships before. Ships that are hurling America's men and guns and war supplies into Europe's fighting lines. Chief among the tools relied upon to carry out the government's $2,000,000,000 shipbuilding program, are Disston saws.

Nowhere is the importance of perfect saws more imperative than in building a good ship and keeping her safe and seaworthy. That is why shipbuilders and ships' carpenters use Disston saws and tools.

From the shipyards of Clyde to the drydocks of Calcutta, wherever the tang of shipping puts the importance of perfect tools into italics, you will find Disston saws and tools performing their faithful services.

The shipping of the world salutes the superiority of Disston standards—from the leisurely gondolas of Venice to the swift greyhounds of Ocean lanes.

Disston makes every type of saw used in shipbuilding. Metal saws that nip into the harsh texture of steel cables and heaviest castings with rigid ease. Powerful cross-cut saws that fell and buck the millions of feet of Southern pine, Douglas fir, oak, ash, cedar, and cypress needed for our new merchant marine. Great power-driven band and circular saws that cut it into shipyard lengths. Hand saws that are the first choice, man for man, of over 75 per cent. of the woodworkers of the world.

All Disston saws and tools are guaranteed perfect in material and workmanship. Send today for the free Disston Handbook of Saws.

7 Lidgerwood single drum electric mine hoists, drums 30 in. x 24 in. face, 4 in. flanges, 1500 lbs. rope pull at 1000 ft. per minute, geared to 52 H.P. Westinghouse motors, 220 volts direct current.
8 Lidgerwood single drum electric hoists, drums 30 in. x 24 in. face, 4 in. flanges, designed for 1500 lbs. rope pull at 1000 ft. per minute, each geared to one 52 H.P. Gen. Elec. 60 cycle motor; form M, 220 volts, 830 R.P.M.
2 Meade-Morrison 2-drum electric hoists, drums 30 in. x 24 in. face, 3 in. flanges, with 40 H.P. Westinghouse direct current motors, 500 volts, type K, 500 R.P.M.
1 Maine 2-drum electric hoist, drums 12 in. x 24 in. face, 6 in. flange, direct geared to 37 H.P. induction motor, 60 cycle, 440 volt, 1200 R.P.M.
1 Maine single drum electric hoist, 220 volts direct current, 450 R.P.M., 2000 lbs. capacity. Drums designed for 400 ft. of cable.

Hoists—Steam Driven

1 Double drum, double cylinder reversing steam hoist, cylinders 8½ in. x 10 in. drums, 27 in. x 30 in. capacity, 3000 lbs.
1 Flory double drum, double cylinder steam hoist, cylinders 8¼ in. x 10 in., drums 27 in. x 30 in.
1 Rawson & Morrison twin drum steam hoist, cylinders 10 in. x 12 in., drums 32½ in. x 12 in., flanges 4 in.
1 Meade-Morrison double drum, double cylinder steam hoist, cylinders 10 in. x 12 in.

We have on hand all classes of Power Machinery

MacGOVERN & COMPANY, Inc.

114 LIBERTY STREET - - NEW YORK, N.Y.

Portable Electric Planing Machine

If you build Wooden Boats you need this machine for planing decks and ways.

Made in three sizes, 10-12-15-inch, and furnished complete with motor ready to operate.

Annular ball bearings to rolls.

Depth of cut is adjustable and knives lift clear of floor on return movement.

Descriptive circulars sent upon request

L. Power & Company, 50 So. 23rd Street, Philadelphia, Pa.

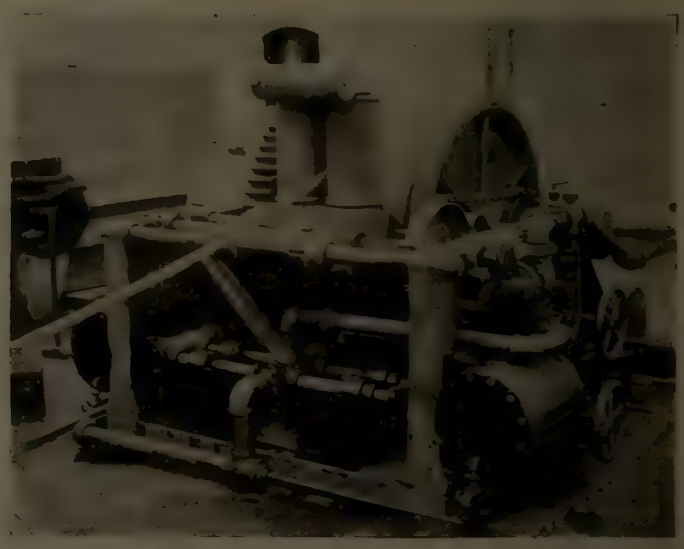
Those wishing to Increase the Earning Power of their Tug are installing the

"CORBET"

Automatic Double Cylinder Steam Towing Machine



This illustration shows our No's. 1, 3 and 4 machines, which represent our new designs, the engines of which are built on the outside of the frames, enabling the machine to be built much lower than if the engines were underneath, as in our No. 2 design. This also prevents the tug from being tipped when pulling at right angles at the tow.

No tug's equipment is complete without having one of our up-to-date Automatic Steam Towing Machines installed on it.

These machines accommodate galvanized steel hawsers from ¾ in. diam. up to 1½ in. diam., thereby accommodating any size tug. This does away with having to buy a new manilla towing line each spring, as the steel hawser will last at least 10 years.

They allow the tug to be operated with a smaller crew and keep them contented.

We have already installed a large number of these machines on tugs on the Pacific and Atlantic coasts, as well as on our Great Lakes. In every case, they are giving perfect satisfaction.

We also manufacture anchor and deck winches and steering engines.

Owen Sound, Ont., July 14, 1916.

The Corbet Foundry and Machine Co., Ltd.,
Owen Sound, Ont.

Dear Sirs:

This is the fourth year that we have used your Towing Machine on our Tug "Keenan." After that experience we can say that we would not be without it under any circumstances, and cheerfully recommend it to any one needing such a machine.

It has never given us a moment's trouble in that time, and the towing cable is as good as the day we put it on.

Yours very truly,
Keenan Bros., Limited,
Per J. E. K., Secretary-Treasurer.

Canadian Made Ventilating COWLS

We are now in a position to supply Canadian shipbuilders with Canadian-made Ventilating Cowls in any desired size. We have installed the best of equipment, stamps, hammers, furnaces, etc., to produce a sturdy, high grade Cowl. Our men are experienced in this work, coming from some of the largest shipbuilding firms on the Clyde. Gurney Cowls are made of heavy gauge steel in four pieces, and are so constructed as to be durable under all conditions. Finished in Black Steel or Dipped Galvanized. During the past season we have supplied all the Cowls used by Thor Iron Works, Polson Iron Works, Collingwood Shipbuilding Co., Kingston Shipbuilding Co., Midland Dry Dock, and we also supplied a great number to the Canadian Vickers Company. Send for quotations and information.

GALLEY RANGES

SUPPLIES AND EQUIPMENT

Our Ranges and Utensils are made in sizes to suit any tpye vessel. Every one, from the smallest to the largest, is constructed of the best materials and from designs proven efficient under working conditions. Made for heavy duty.

We have supplied Galley Ranges to almost all the large Canadian Shipbuilders operating during the past year. Gurney Ranges are recognized by the trade as the finest tpye of cooking range made to-day. Let us quote you on your requirements.

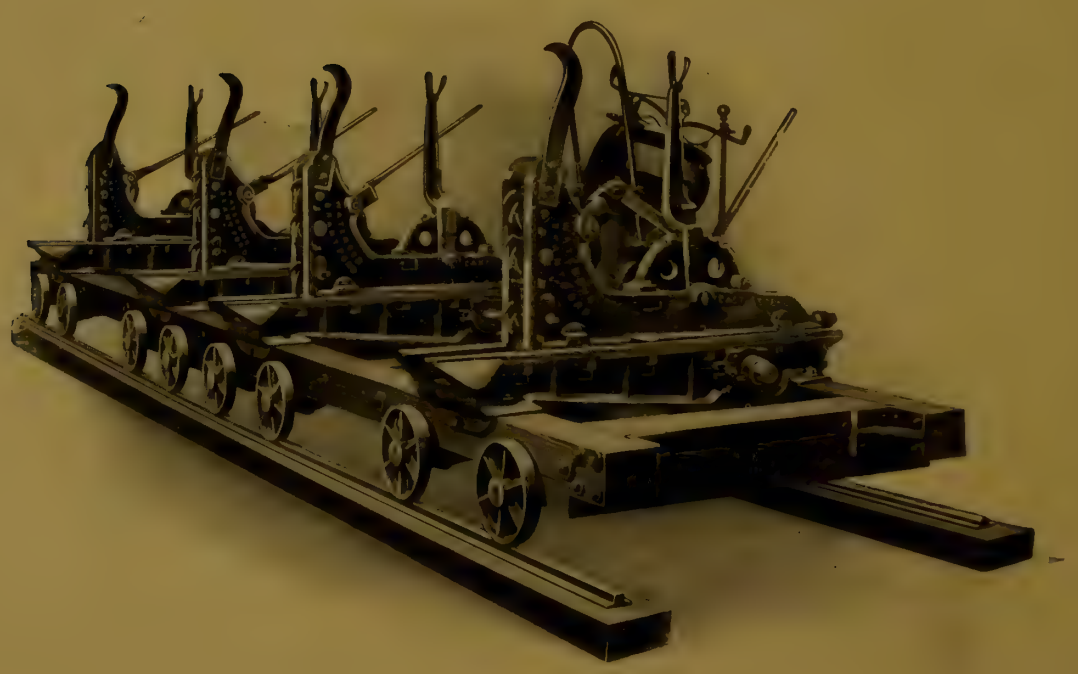
Waterous Steel Carriages

for

Fast Cutting Service



WATEROUS Steel Carriages are being used in the largest, best equipped Mills in Canada today.

Built for fast cutting, for accuracy, and to give operating service, they are carefully put together of the best materils obtainable—they stay right.

Increase in cutting efficiency and the increase of cutting speed have been taken care of in the design of these carriages.

Improvements in the knee and head blocks and in all moving parts to overcome lost motion: a new setworks—our No. 4—(which may be attached to Steam Setter, or be replaced by trout power set works) which absolutely prevents and will not develop slack; new style, inserted tooth; quick and easy operating dogs; a friction receder which is operated with the Setworks—these special features are what keep the Waterous Steel Carriage at its place at the head of the list of "up-to-date Sawmill Equipment."

We build our Steel Carriages in sizes of 36" to 72" knee opening, in any length and with any number of head blocks—screw or rack motion. They are adaptable for rope or gunshot feed.

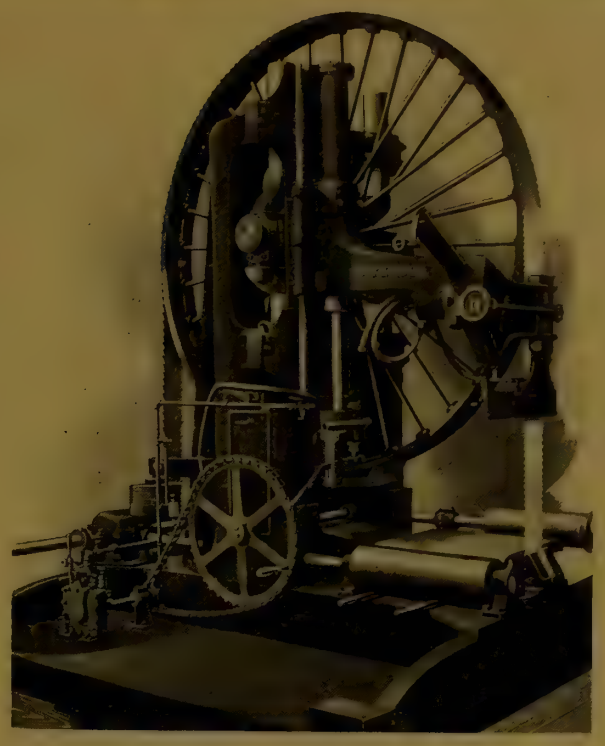
BRANTFORD, ONTARIO, CANADA

Waterous Band Mills

Every Canadian Mill demanding rapid and accurate cutting, uses Waterous Equipment.



Waterous Sawmill Machinery has well repaid our half a century study of the sawmill conditions in Canada. We know, and men who use Waterous equipment know that *only the best* is good enough for our customers. They ask for it and they get it. Our standing guarantee can be found in hundreds of mills throughout the country.

Twelve Reasons why Waterous is Better:

The base extends completely around the mill.
The upper wheel is supported above and below mandrel.
The wheel has extra wide range of adjustment.
The tensioning device is double knife-edged.
The upper wheel is mechanically tilted from front or rear.
Both guides are saw-centre swing, single or double cutting.
Upper guide is absolutely rigid, non-breakable, water cooled.
Operating mechanism is direct, rapid and power driven.
No belts to gum or slip.
All mechanism is enclosed within column.
Lower guide is *extra high* and opens instantaneously.
Every part is accessible.

Interior shook mill of El Paso Milling Co. Capacity 1,000,000 feet daily. A Yates No. 345 Hopper Feed Resaw is used.

Short Stock

How Do You Handle It?

Shook stock, cut to length, ripped to width—truck loads of it—ready for final resawing. How will you handle it? Hand feed it perhaps, piece by piece to a single cutting resaw of limited capacity—but never if you have investigated a big capacity Yates Hopper Feed Resaw. The

No. 345 Hopper Feed Yates Twin Horizontal Resaw

is unhesitatingly recommended to the man who knows that increased profits always follow decreased handling costs.

Quantities of short length material handled a piece at a time mean high production costs. The same material **hopper fed** gives low production costs and an assured profit.

Cut-to-length shook stock in double or triple thickness stacked into the hopper is resawed into shook thickness, and a steady, hour-in-hour-out production maintained.

The high feeding rate—full width cutting capacity—and continuous action gives an output unequalled by any other method.

Saves 20% to 30% in Labour and Materials

A Portable Electrically Driven Machine for Carpenters and Builders

The Elliot Woodworker

Over two hundred builders in Detroit are using the Elliot, two hundred and fifty in Toronto, and hundreds in other cities and towns in Canada and the United States. In fact, the Elliot is known as a vastly superior machine from Juneau, Alaska, to Johannesburg, South Africa. Sales—that's what proves merit.

The portability of the Elliot Woodworker, the small space required, the ease of running, the low power cost, and the exclusive labor saving devices make it the most satisfactory machine on the market for carpenters and builders.

The Brooklyn Navy Yard has six machines, Newport one, Norfolk Navy Yard three machines, West Point Military Academy one, besides numbers of others used in cantonment work by the American Government.

Wherever this exceptional machine has been introduced it has given honest service and won the confidence of its users —it saves 20 to 30 per cent. in labour and material costs.

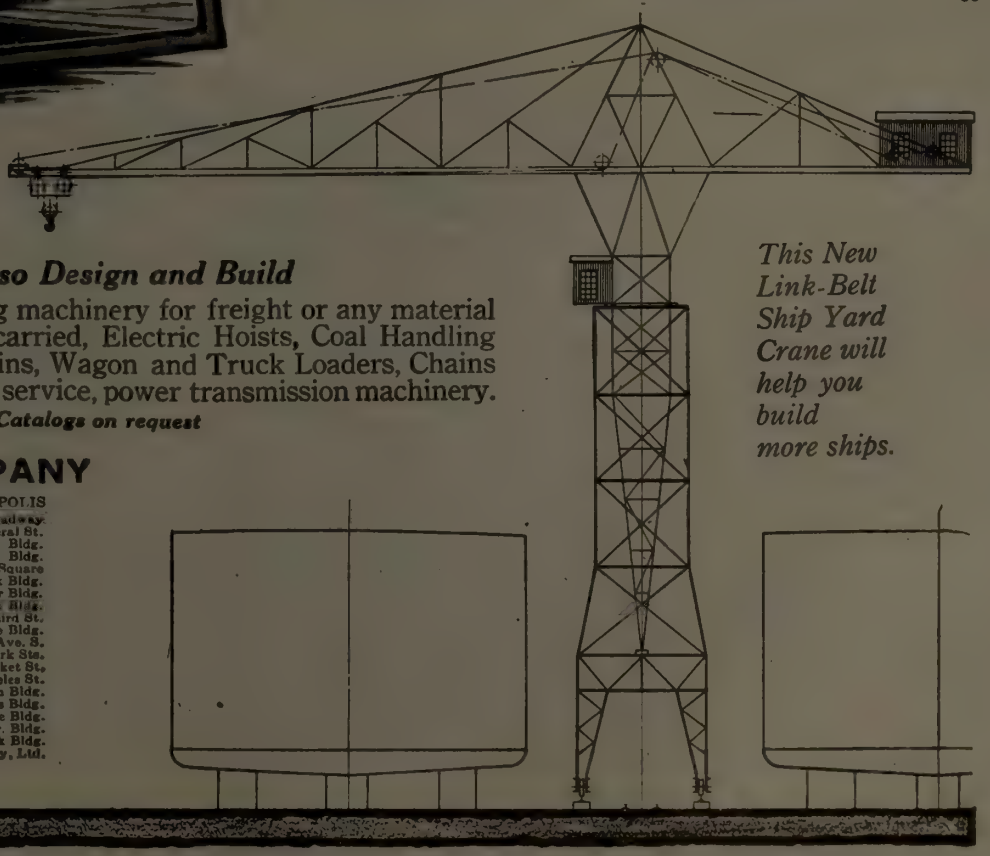
LINK-BELT CRANES
FOR SHIP YARDS

PRESENT conditions in ship yards throughout the country demand maximum speed and efficiency. There is no other device so essential to low cost and speedy construction in a ship yard as a Crane. It is extremely useful in the general handling of material around the yard, and is indispensable for handling material during the construction of vessels on the ways.

The Link-Belt Locomotive Crane and the Link-Belt Gantry Crane meet the exacting requirements of ship yards—they are reliable, speedy and efficient. We are now building many Cranes for American Ship Yards as well as for France. They are all built to the high Link-Belt Standard of Quality. Nineteen Link-Belt Cranes are in daily use in one American shipyard.



This New Link-Belt Ship Yard Crane will help you build more ships.

We Also Design and Build

Elevating and conveying machinery for freight or any material that can be moved or carried, Electric Hoists, Coal Handling Machinery, Crushers, Bins, Wagon and Truck Loaders, Chains and Sprockets for every service, power transmission machinery.

Oxy-Acetylene Welding and Cutting

Welding

In practically every line of metal manufacturing and repairing, Oxy-Acetylene Welding is saving time and money—producing neater, stronger work—and reclaiming valuable machine parts and tools from the scrap pile.

Cutting

Oxy-Acetylene Cutting also effects many economies over the old method of sawing. One man with a Prest-O-Lite Cutting outfit can do the work of two and do it quicker and better.

This Ship's Capstan Reclaimed At a Saving of Nearly $200.00

THIS illustration shows a broken ship's capstan repaired at a trifling expense by the Prest-O-Lite Process. The broken parts were welded into place and this 1090-lb. casting was made as good as new. The saving on this one job was nearly $200.

In almost every branch of manufacture the Prest-O-Lite Process of Oxy-Acetylene Welding and Cutting has proved itself to be the greatest economic factor known to mechanical art—a veritable revelation in cost-reducing and money-saving. Useful in every line of human endeavor where metal or machinery is produced, shaped, moulded, built or used.

In Shipbuilding Plants, Railroads, Steamship Lines, Mines and Factories, the Prest-O-Lite Process will effect many important savings. Costly tie-ups and delays, caused by the breakdown of an important machine, are avoided and valuable castings, tools and machine parts worth thousands of dollars are saved and quickly put back into service.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene (ready-made carbide gas) is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment.

Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.
Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 37 Toronto, November 15, 1917 No. 22

The Wooden Shipbuilding Industry

No single feature connected with war industries in Canada is of greater importance than the shipbuilding revival which has been produced by the urgent demand for vessels for ocean service. Early in the war vessels upon the great lakes commenced to be called upon for trans-Atlantic work and a slight increase in shipbuilding operations took place, but it was not until the present year that the industry commenced to assume such proportions as it has now reached.

The present issue of the Canada Lumberman will come as a surprise to some of its readers. The magnitude of the wooden shipbuilding industry in Canada has not yet impressed itself upon many of the lumber manufacturers of the country, simply because its operations have not affected their business directly. Although the wooden shipbuilding industry has only been in existence in Canada in its present dimensions, for a few months, however, it is no exaggeration to predict that in one way or another the effect of the great consumption of timber in shipbuilding will be felt, in the near future, wherever lumber is manufactured in Canada.

In this issue we have described some of the leading shipbuilding operations in Canada and have sought to give a good general idea of the industry. This is a task which can be approached only in a general way, but we feel sure that the contents of this issue will open the eyes of many lumbermen to immensity of the shipbuilding industry and its importance both from an industrial and a national point of view.

It would not be right to refer to the shipbuilding industry solely as it affects the industrial life of the people of Canada. Primarily the revival of the shipbuilding industry in Canada is due to the war. Had it not been for the loss of tonnage by submarine attack, and the great demand for ships in which to transport troops, equipment and supplies to Europe, it is safe to say that Canada would have continued to be for many years, if not for all time, a nonentity in the shipbuilding industry of the world. The reasons for Canada's backwardness in this connection are discussed in some of the articles contained in this issue. For one reason and another we have permitted other nations in the past to monopolize shipbuilding and, as a consequence, to control the transportation business upon which we depended for sending our exports to the markets of the world.

The impetus given by the war, figuratively speaking, has turned Canada, and in fact all of North America, into one great shipbuilding yard, and this continent which formerly was of insignificant importance in shipbuilding, is looked upon today as the potential source of vessel supply to save the shipping situation of the Allies. It would not be possible, at this early date, to furnish statistics of the increase in shipbuilding which has taken place. An illustration, however, may be given by the case of Toronto. Before the war, the shipbuilding operations conducted at Toronto were not of much importance. Today the shipbuilding firms in Toronto are turning out a combined tonnage, three times greater than that of the whole of Canada before the war.

The place of the wooden ship in all this activity is interesting. It was thought before the war that the wooden ship was a thing of the past. The advent of the steel vessel seemed to have put the wooden ship out of business for all time to come. Under the pressure exerted by the war, however, the wooden ship has again come to the fore. It is not hard to find a reason for this. In the first place the wooden vessel, economically speaking, is still thought by many people to be a sound proposition, within definite limits. The wooden vessel is staunch, durable and long-lived. From an economical point of view its great drawback is that it cannot be built in such large sizes as the steel vessel and so has had to take a back seat in the shipbuilding programme of the past 25 or 50 years. But the fact that it cannot be used for large vessels is one of its commendations during the present crisis. For small vessels do not present so costly a target to the submarine.

Wooden vessels can be quickly built. Had the government decided to build only steel vessels, it would have taken years to furnish what can be furnished in wood in a much shorter time. Wooden vessels which were not even designed last spring will be crossing the Atlantic before next spring with cargoes for the allies. The fact that so much of the tonnage required is being constructed of wood will also relieve the situation with the building of steel vessels, making it an easier matter to obtain the steel plates required.

As to the future of the wooden vessel, it would be folly to undertake anything in the nature of prediction. Views of directly opposite natures are held by different people on this point, but it does seem reasonable to expect that even if the steel vessel becomes once more the great ocean carrier, the wooden vessel will have its definite field of usefulness in lake and coasting trade. This, however, is entirely beside the question today, because the greatest authorities upon the war have declared that Great Britain and the Allies must have as many ships as can be turned out, both wood and steel.

Early Days of Canadian Shipbuilding

An Outline of the Chief Events Connected with the Industry—Lasalle's "Griffon"—The Royal William—First Days of Lake Navigation

The history of shipbuilding in Canada carries us back to the earliest days of the settlement of North America. Probably the most interesting portion of the history is that which relates to the origin of shipbuilding on the Great Lakes. The pioneer of naval architecture on the upper lakes was LaSalle, the great French explorer. In December, 1678, LaSalle, wishing to navigate the upper lakes, set to work upon the construction of a brigatine of 60 tons. The site chosen for the construction of this vessel was about "two leagues above Niagara Falls," on the south bank of the river. The exact spot is a matter of dispute, but the general belief is that it was about one-quarter mile south of Cayuga Creek, on what is now the United States side of the river.

On December 26, 1678, LaSalle drove the first pin into the keel of his vessel, which was called "The Griffon," as a compliment to Count Frontenac, Governor of Canada, whose arms showed two griffons for supporters. The Griffon was probably a two-masted vessel, and, from such sketches as are available, she must have been devoid of any beauty. She was unpainted and the planks of her hull were rough. The seams and joints were caulked with the fibres of the fir tree and each covered with fir tree pitch.

The vessel was equipped, rigged, and ready to sale on August 1, 1679. She carried seven small cannon, and her crew consisted of 60

La Salle's vessel—built near Niagara Falls in 1678.

sailors, boatmen, hunters, and soldiers. On August 7, 1679, the Griffon sailed out into Lake Erie and inaugurated the navigation of the upper lakes. Her career was brief. She reached Lake Michigan, but was lost somewhere between Washington Island and Mackinaw, on Lake Michigan.

An illustration of the Griffon, after a sketch by L. D. Johnson, is published herewith. This sketch was prepared from early sketches and descriptions. There is much dispute, however, in regard to the actual appearance of this historic vessel, though many authorities believe that the accompanying sketch is a fairly accurate one.

No vessel bearing the American flag was afloat above Niagara Falls before the year 1796. In this year a British-built sloop of 75 tons, purchased from the Northwest Fur Company, appeared upon Lake Erie.

On Lake Ontario the first commercial schooner to make its appearance was the Simcoe, which was built at Simcoe Island about 1793 by the Northwest Fur Company. A second vessel, built in 1798 and called the Prince Edward, was launched at the Stone Mills, on the Bay of Quinte.

In 1795 three merchant vessels were engaged in carrying passengers and merchandise between Kingston and Queenston. Previous to this, in the year 1791, government steamers had commenced carrying passengers on Lake Ontario, and the fare from Kingston to Queenston was two guineas, wines included. The voyage might last anywhere up to one week.

The first lake vessel to cross the Atlantic ocean was the "Cherokee," a Canadian vessel, built and sailed by Capt. Gaskin. The first United States lake vessel to enter into the direct trade with Europe was the Dean Richmond, from Chicago, which made its first Atlantic voyage in 1855.

In 1849 a lake vessel from Cleveland, Ohio, went out of the St. Lawrence and rounded Cape Horn with passengers and freight for California.

Early Shipbuilding in Canada

An interesting description of the rise of the shipbuilding industry in Canada is contained in a book entitled "Eighty Years of Progress in British North America," published in 1863. "Shipbuilding," the book states, "was one of the earliest branches of industrial activity in Canada. As early as 1715 shipbuilding at Quebec was pretty brisk, although there was great reason for complaint that the French would not import the fine timber of the country. The fur trade appeared to monopolize all the attention of the French rulers. Although the British drew large supplies of lumber from the Atlantic provinces, New France contributed no part of her immense forest treasures to increase the naval resources of the great rival of England on the seas. . . . In 1731 M. de Maurepas, the French Minister of Marine, offered a premium of 500 francs for every vessel gauging 200 tons or over, of colonial build, and sold in France or the Antilles, and 150 francs premium for each barge of 30 or 40 tons, if similarly disposed of." In 1752 ten vessels of 40 to 100 tons were built in Canada.

In 1734 there were 52 sawmills in that part of the province lying east of the Ottawa River, the population of the country being 37,252 souls. In 1827, or nearly one hundred years later, the number of sawmills had increased to 565, with a population of 471,876.

Vessel Output at Quebec

Between 1791 and 1861 the number and tonnage of seagoing vessels built at Quebec during decennial periods was as follows:

Year.	No. of ships.	Tons.
1791	12	574
1801	24	3 404
1811	54	13 091
1821	22	2.254
1831	38	6.170
1841	64	23.122
1851	66	41 605
1861	51	*25,546

*The average value of ships built at Quebec is taken at $40 a ton.

From 1787 to 1861 there were 2.939 ships of all kinds built at Quebec, the aggregate tonnage amounting to 890 201. Up to that time the largest ship ever constructed on this continent was built in Quebec in 1825. It was called the Baron of Renfrew, and measured 5.294 tons. Another large wooden ship was built in 1824, measuring 3 690 tons, but these huge vessels were not successful. The enumeration above does not include other vessels which were constructed at the different ports of the Valley of St. Lawrence and sometimes sent across the Atlantic for sale. Many such vessels were also built on Lake Huron, and at Toronto, etc., but in consequence of the general depression in trade after 1857 little of this class of construction was carried on in the lake districts.

In 1723 nineteen vessels cleared from Quebec, containing cargoes of peltries, lumber, and provisions.

New Brunswick's Early Operations

An interesting article on shipbuilding in New Brunswick is contained in "Eighty Years of Progress in British North America," contributed by M. H. Perley. The advantages of New Brunswick for shipbuilding, he says, were apparent to its earliest settlers. Jonathon Leavitt, one of the first settlers in the harbor of St. John, built a small schooner there before 1770. This vessel was named the "Monneguash." In 1773 a large schooner was built at Miramichi and named "Miramichi" by William Davidson, the first British settler on that river. From the building of these two schooners the Province of New Brunswick dates its shipbuilding industry. In the early days the forests of the province supplied timber of large size in any quantity for building ships of the first class. Such ships were constructed chiefly of black birch and larch or hachmatack. The black birch was used for the keel, floor, timbers, and lower planking. Larch or hachmatack was used for all other timbers, knees, and upper planking. American live and white oak were imported for stems and posts of the best

class of ships and pitch pine for the beams. White pine was used for the cabins, interior finish, and for the masts. Black spruce furnished as fine yards and topmasts as any in the world. Elm, pitch, maple, cedar, and spruce were all used in the construction of ships of the second class and small vessels.

Shipbuilding was prosecuted more extensively than elsewhere in the early days at the ports of St. John and Miramichi, where it first commenced. Vessels were also built at St. Andrews and at the various coves and habors on the Bay of Fundy, especially at Teignmouth and Quaco, along the banks of the River St. John for ninety miles from the sea, and at the Grand Lake; also to a considerable extent on the banks of the Petecodiac River, and at Sackville, in the Cumberland Basin.

Within the St. Lawrence vessels were chiefly built at Shemogne, Cocagne, Buctouche, Richibucto, Kaouchibouguac, Miramichi, Shippigan, Bathurst, Dalhousie, and Campbellton.

The "Marco Polo," renowned for her sailing qualities, was built in the harbor of St. John, and was followed by a fleet of other ships equally famous for their strength, speed, and durability.

New Brunswick's Output

The following table shows the number of new vessels registered in the Province of New Brunswick and the tonnage in each year from 1825 to 1860, including vessels built for owners in the United States and sent home under certificate or government pass:

Year.	No. of vessels.	Tons.
1825	120	28,893
1826	130	31,620
1827	99	21,806
1828	71	15 656
1829	64	8,450
1830	52	9.242
1831	61	8.571
1832	70	14.081
1833	97	17,837
1834	92	24.144
1835	97	25,796
1836	100	29 643
1837	99	27 288
1838	122	29.167
1839	164	45,864
1840	168	64,104
1841	119	47,140
1842	87	22 840
1843	64	14,550
1844	87	24,543
1845	92	28,972
1846	124	40 383
1847	115	53 373
1848	86	22,793
1849	119	39 280
1850	86	30 356
1851	99	49 595
1852	118	58.399
1853	122	71,428
1854	135	99,426
1855	95	54.561
1856	129	79.907
1857	148	71.989
1858	75	26.263
1859	93	38 330
1860	100	41,003

The proportions in which the vessels were built in the different parts of the province in 1854 may be judged by the following statement from the ports of registry: St. John, 94 vessels, 56 542 tons; Miramichi, 21 vessels, 13.205 tons; St. Andrews, 7 vessels, 17.771 tons. The vessels shown as registered at Miramichi include all those built in the Gulf. Those registered at St. Andrews include all that were built in Charlotte County.

On an average of £8 sterling per ton, the vessels built in 1854 were worth £795,408 sterling. The amount of daily labor necessary upon the hull and supports of a ship under construction at that time averaged ten days for each registered ton.

Nova Scotia's Shipbuilding Operations

Rev. William Murray contributes an article on shipbuilding in Nova Scotia to the volume referred to above. Great facilities for shipbuilding existed in Nova Scotia, he says. Correct statistics showing the extent to which this branch of industry was carried on in the earlier years are not available. The greater number of vessels in the province were comparatively small and adapted to the coasting trade and trade with the United States. Many vessels were built at Pugwash, New Glasgow, Pictou, Sydney, C.B., Shelburne, Windsor, and other places. These vessels were from 300 to 1,200 tons, and commanded a ready market in England and elsewhere abroad.

The following table shows the extent to which shipbuilding was prosecuted in Nova Scotia from 1852 to1861:

Year.	No. of vessels.	Tonnage.	Value.
1853	203	31,376	$1,557,090
1854	244	52,814	2,546,595
1855	236	40,469	2,240,710
1856	208	39,582	1,852,540
1857	...	.....	.....
1858	151	16,366	757,900
1859	...	.....	.....
1860	233	20,684	852,831
1861	216	23,634	972,448

In 1846 eighty-two vessels were built in Nova Scotia whose tonnage was 12,012. The estimated value of these vessels was $330,000. In 1847 ninety-six vessels were built, the tonnage being 18,445 and the value $553,350. In 1860 sixty-six vessels were built, valued at $309,225.

The same volume contains a short reference to shipbuilding in Newfoundland, which it says was not prosecuted to a very large extent, as the native timber did not furnish materials for ships of the first class. The returns for 1857 gave 88 vessels, totalling 2,427 tons.

The Beginning of Lake Steamship Traffic

A few other outstanding facts in connection with the early shipbuilding industry are of interest. Among these is the history of the steamer "Accommodation," built by Hon. John Molson, at Montreal, in 1809. Her engines were made in Montreal, and she was placed upon the trip between Montreal and Quebec, being the first steamer to operate on the St. Lawrence.

The first steamer upon Lake Ontario was the "Frontenac," launched on September 7, 1816, at Finkle's Point, 18 miles from Kingston. Her proportions were: Length, 170 ft.; beam, 32 ft.; two paddle-wheels of 40 ft. circumference each; registered tonnage, 700 tons. Her machinery was imported from England. She operated between Kingston, York, Niagara, and Queenston, the fare being £2 for the trip from Kingston to Niagara. The "Frontenac" was burned in 1827.

First Atlantic Steamer—"The Royal William"

Probably the most important fact in connection with Atlantic navigation is that which relates to the voyage of the first steamer to cross the ocean entirely under its own steam. The honor of having constructed this vessel belongs to Canada. The vessel was known as the "Royal William," a ship of 1,000 tons and 180 h.p., built at Three Rivers. Her engines were put in at Montreal, and she made the voyage from Pictou, N.S., to Cowes, Isle of Wight, in fourteen days, in the year 1833. This was five years before the voyage of the "Sirius," which has been supposed by some people to have been the first vessel to cross the Atlantic Ocean entirely under her own steam.

Making Ship Treenails

With a gigantic shipbuilding program suddenly thrust upon us, there is opened up a promising side line for some of the woodworking factories that are disposed to take up the manufacture of ship treenails. The specifications for a standard wooden ship, built of fir or Southern pine, call for 16,000 treenails, 1⅜ in. diameter by 3 ft. 4 in. long, and 4,000 1¼ in. diameter by 2 ft. 2 in. long. The preferred woods are locust and eucalyptus, although pine, oak, and maple are used to a limited extent. The material must be sound heartwood, straight-grained and air-seasoned.

Treenail stock may be run in random lengths on a four-side moulder or a dowel machine. Some treenail makers use a variety lathe, rigged up to run without stopping, so that an ordinary man can turn out 200 or more finished treenails per hour. In this case one end of each nail is left square for driving and the other end rounded slightly, or sharpened. Shipbuilders often complain that moulder-run treenails are inaccurate and oversize, so that before using they must be driven through an accurate hole in a slab of steel to size them.

Heavy ship timbers are spiked together with these wooden pins; and planking is fastened into place partly with treenails and partly with iron bolts and screws. Holes for the pins are bored with portable drills, driven by electricity or compressed air.—The Wood-Worker.

Longest Masts in the World

Four of the longest ship masts ever built on the Pacific Coast, if not in the world, are being turned out by Robert McIntosh, a pioneer shipbuilder and repairer, at Portland, Ore. Each of the sticks measures 136 feet in length. They are for shipment to Cape Town, South Africa. Six booms and four gaffs are being built by Mr. McIntosh at the same place, and with the masts will be forwarded to South Africa. The timbers out of which the masts are being constructed were procedar, and spruce were all used in the construction off ships of the sticks is 26 inches in diameter at the butt. They are free from the slightest blemish.

Imperial Munition Board Standard Ships

Fifty-One Now Under Contract in Canada—Details of Construction and Timber Specifications—Work Now Well Under Way

The wooden vessels fitted with steam propulsion, which are building in Canada to the order of the Imperial Munitions Board, on account of the British Government are being built on a general specification, and standard plans for general arrangements and midship sections. These plans are not intended to furnish working details, but are to be treated as general data intended to indicate in outline the class and construction of vessel required.

The details of hull construction, fastenings, etc., in the specification relieve the contractor from the responsibility of employing a skilled staff to work out detail drawings and submit proposals for such details to the Classification Society and to the Board's advisers, who will, however, give all assistance in their power to help contractors, without accepting responsibility for the proper carrying out of the contract. The vessels are to be built to Lloyd's requirements for A1 classification and to British Board of Trade requirements as far as necessary for cargo steamers. The hull's dimensions are to be as follows:—

Length between perpendiculars	250	feet
Breadth, extreme	43½	feet
Breadth, moulded	42½	feet
Depth, moulded	25	feet
Depth over keel	27	feet
Draught for displacement	22	feet
Draught over keel	21	feet
Deadweight on 20 feet maximum draught to Lloyd's summer freeboard, approximated	2,500	tons
Deadweight on 21 feet maximum draught, approx.	2,800	tons

The hull is to be divided by four bulkheads in addition to deep tank bulkheads, viz., collision and aft peak bulkheads, and bulkheads at fore and aft ends of machinery space. All lumber used in construction is to be Douglas fir, unless otherwise specified, but in the case of yards in the eastern and Maritime Provinces the lumber may be such as can be easily obtained, but it must be approved by the Board.

Owing to the danger of corrosion arising in the steel work specified, the keelson logs are not to be of oak except with the Board's special permission.

General Equipment Details

Each vessel is to be fitted with top-gallant forecastle and combined poop and bridge, two masts and derrick posts with cargo gear, four hatches with five steam winches, steam windlass with outfit and gear as required by rules, deep water ballast tank for approximately 400 tons of water, accommodation for officers and crew, bridge house with navigation bridge, to be located at the forward end of the combined poop and bridge, officers and engineers to be housed in engine-room casing.

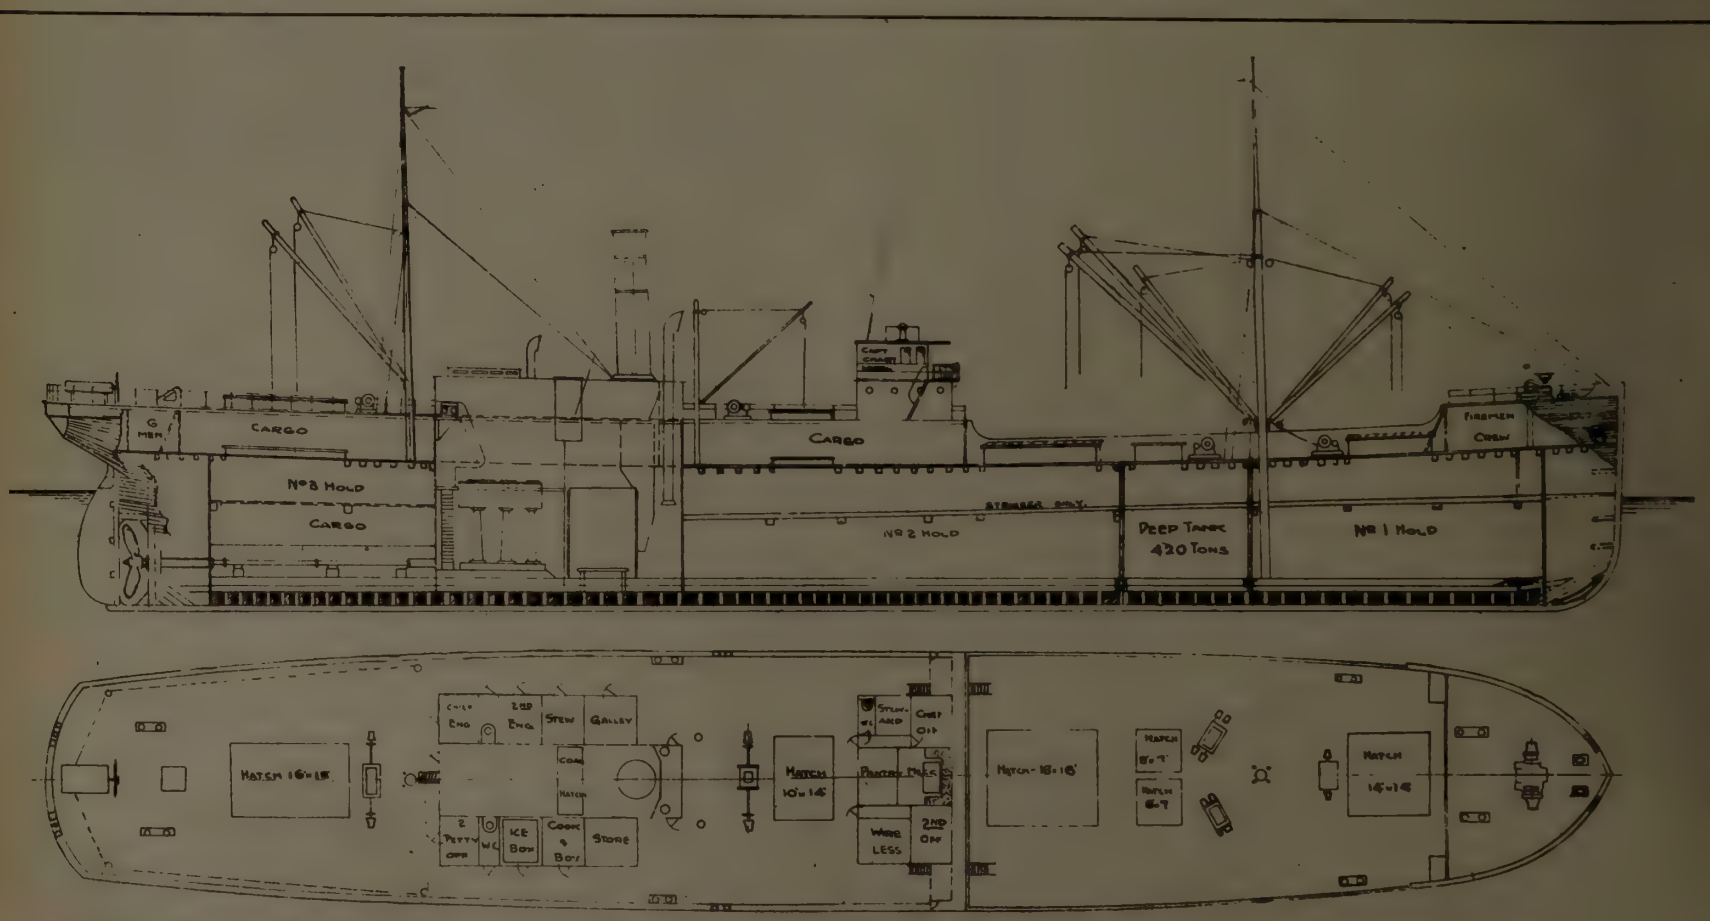
There is to be electric lighting equipment of 7½ kw. capacity, driven by single-cylinder, forced lubrication engine, to be supplied with all cables, fittings, lamps and switchboard.

Each vessel is to be provided with two class A lifeboats, built to British Board of Trade requirements, one on each side of the vessel, each fitted with yellow metal air tanks, compass, etc., and each boat to be capable of taking the whole crew; a dinghy and service boat are also to be supplied, and all boats are to be supported in davits in Classification Society's requirements.

The machinery is to consist of one set of triple expansion surface-condensing engines, to develop 1,000 i.h.p. at sea at 65/70 r.p.m.; cylinders to be approximately, 20, 33 and 54 inches diameter, by 40 inch stroke: condenser with about 1,500 feet cooling surface; independent main feed pump with long stroke simplex type and with control tank under; air circulating, feed and bilge pumps to be driven by levers from main engine; general service pump of duplex type to be fitted to serve as boiler feed pump; main feed pump of simplex long feed type, fresh water pump; ballast pump; duplex 100 tons capacity; exhaust surface type feed heater; evaporator of 15 tons capacity, auxiliary condenser for winches; feed filter of gravity tank type; two boilers of Howden water-tube type, three-furnace design, for forced draught, and fitted for coal or oil burning, and oil-burning installation and pumps to be fitted.

After completion, the trials are to consist of a 6-hour set run at full power, and builder must guarantee workmanship and material for six months after delivery.

Everything is to be supplied to complete the vessel as a full sea-



Diagrams illustrating general arrangement of 2500 ton wooden steamer, many of which are to be built in Canada for the Imperial Munitions Board.

going ship to Lloyd's requirements and to the Board's satisfaction.

Contracts for the construction of 51 vessels of the type described above have, according to a memorandum issued by the Imperial Munitions Board been placed with Canadian shipbuilders in British Columbia (for 33 ships), and on the St. Lawrence, Great Lakes and East Coast (for the balance). It is expected that the engines as well as the hulls will be built in Canada, a number of contracts for engines having already been let in the Dominion. The Board expects to have some of the vessels in the water before the end of 1917. The Board's plans involve as complete standardization as is possible, in order that in the future a maximum production may be realized if this type of vessel proves a success.

The specifications for the vessels provide for B. C. fir being used for construction throughout, the detail of material requirements and grading being as follows:—

Specifications of Material

Description	Lineal Feet	Section Inches	Piece Length
Planking			
1st Garboard	560	9x18	
2nd Garboard	520	8x16	
3rd Garboard	360	6x16	
Planking	8500	6x12	5%, 30 to 38, bal. 40′ and up, ave. 45′
Bilge Strakes	27500	6x10	" " " " " "
Walls and Top Strakes	16000	6x 8	" " " " " "
Rubbing Strake	550	8x10	" " " " " "
Sheerstrake	550	6x12	" " " " " "
Bulwark Rail Strake	5000	5x 8	" " " " " "
Ceiling			
Limber Strakes	500	6x16	30′
Bottom Ceiling	500	10x12	5%, 3 to 38, bal. 40′ and up, ave. 45′
Thick Ceiling	4500	14x14	and up, ave 45′
Side Ceiling	4500	10x 8	" " " " " "
Upper Side Ceiling	5500	8x10	" " " " " "
Poop and F'cle Ceiling	2000	4x10	" " " " " "
Decks			
Clamps	2200	14x12	40′ and up ave. 45′
Thin Clamps	1200	7x14	5%, 30 to 38, bal. 40′ and up, ave. 45′
'Tween Deck Clamps	170	7x14	" " " " " "
'Tween Deck Clamps, Thin	560	14x12	" " " " " "
Main Deck Waterways	1200	14x12	40′ and up. ave. 45′

Poop Deck Waterways	340	12x12	" " " " " "
Main Deck Rail	260	3¼x10	" " " " " "
Stem	1 piece	18x26	45′ long
Apron	1 piece	24x28	42′ long
Keel	320 lg	20x20	Not more than 5 pieces
Keelsons (3)	800 lg	20x20	Not more than 5 pieces
Deadwood	1 piece	18x24	12′
	1 piece	18x24	11′
	1 piece	18x24	14′
Rudder Post.	1 piece	20x20	37′
Propellor Post	1 piece	30x36	37′
Shaft Log	2 pieces	36x20	30′
Rudder Post Backing	1 piece		12′
		20x18	16′
Frames	85 pieces	12x32	28′
	85 pieces	12x29	18′
	170 pieces	21x23	10′
	170 pieces	12x30	9′
	170 pieces	12x30	8′
	170 pieces	12x17	15′
	170 pieces	12x16	27′
	17 pieces	12x14	16′
Beams	85 pieces	14x12	and 14"x13" from 20′ to 42′
Decking	52000 ft.	4x ¼	decking in multiples of 3′ in lengths of 20′ and up, to ave. 30′
	14000	4x 3	decking in multiples of 3′ in lengths of 20′ and up to ave. 30′
Ribbons	3300	5x 5	40′ and up
Cross Bands	20 pieces	2x10	36′ and up
	12 pieces	2x10	38′
	18 pieces	2x10	40′
	28 pieces	2x10	42′
	70 pieces	2x10	44′
Stem Knee	6		1 piece natural crook if possible
Masts			
Derrick Posts and Derricks as may be determined			
Transom	60	12x14	in lengths about 25′
Bulkheads	15000	8x 4	" " " " " "
Stanchions	1000	12x12	" " " " " "
Hatch Sills	600	16x10	
Poop Bridge and Forcastle Beams	60 pieces	12x10	20′ to 42′
Bulwark Rail	600	18x 6	in length of 35′
Shaft Tunnel	100	10x 4	in length about 20′
	300	10x 4	in length about 20′
Shaft Tunnel Beams	220	6x 6	in short lengths
Machinery Foundations	200	20x20	in short lengths

1st, 2nd, 3rd Garboards and Rail Clamps—Must be straight grained, practically clear, allowing a slight scattering of pin knots on face and knots not exceeding 1 inch diameter on heart side. Edges practically free from defects.

Planking, Bilge Strakes, Shear Strake and Rubbing Strake—Must be practically clear, fairly straight grained. Will allow the following defects: 10 to 15 knots not exceeding 1¼-inch diameter, small pitch pockets 4 inches in length when not extending through the piece. Edges must be practically free from defects. Will allow a slight tracing of sap up to 1½ inches on edges.

Wales and Top Sides and Rail Strake—Must be practically clear, fairly straight grain. Will allow 5 to 10 well scattered knots not exceeding 1 inch in diameter and same sap allowances as above.

Note.—All this material when dressed will be surfaced on the outside of the piece and will be placed on the vessel with the heart turned inside. Grade in all cases will be made from the outside of the piece.

Limber, Strake, Double Ceiling, Poop Ceiling, Side Ceiling, Thin Clamps ("'Tween Deck Clamps")—Must be sound, strong, well selected, uniformally sawn lumber, and will admit sound knots up to 2½ ins. diameter, when not clustered. Closed pitch pockets up to 6 inches in length. Small amount of sap up to the full length of the piece when not exceeding 3 inch face or edge.

Bottom Ceiling, Thick Ceiling Clamps, 'Tween Deck Clamps (14 inch Poop Deck Stringers)—This material will be accepted in a lower grade than the above. Will allow on the heart side shakes not exceeding through the piece over 2 inches and on the outside knots up to 3 inches diameter scattered the full length of the piece. Sap running the full length of the piece for 5 inches face or edge.

Waterways—Must be strong sound lumber, well sewn with any amount of small knots when not in clusters permissible. Must have one edge showing practically select face and must not have any slash knots. Practically no sap.

Stems and Aprons.—Best grade of sound, small knotted timber possible from a butt cut. Small amount of cap on any of the four corners permissable.

Keels—Grade similar to thick ceiling. Sound knotted free from shakes, will allow on the top and bottom face of each and respectively heavy wanes, splits and shakes for 10 feet in length and ½ inch of the distance through the piece. Also ½ inch wane on each edge of one face and may extend the full length of the piece.

Keelsons (3)—Grade similar to thick ceiling. Sound knotted, free from shakes. Will allow on the top and bottom face of each and respectively heavy wanes, splits and shakes for 10 feet in length and half of the distance through the piece.

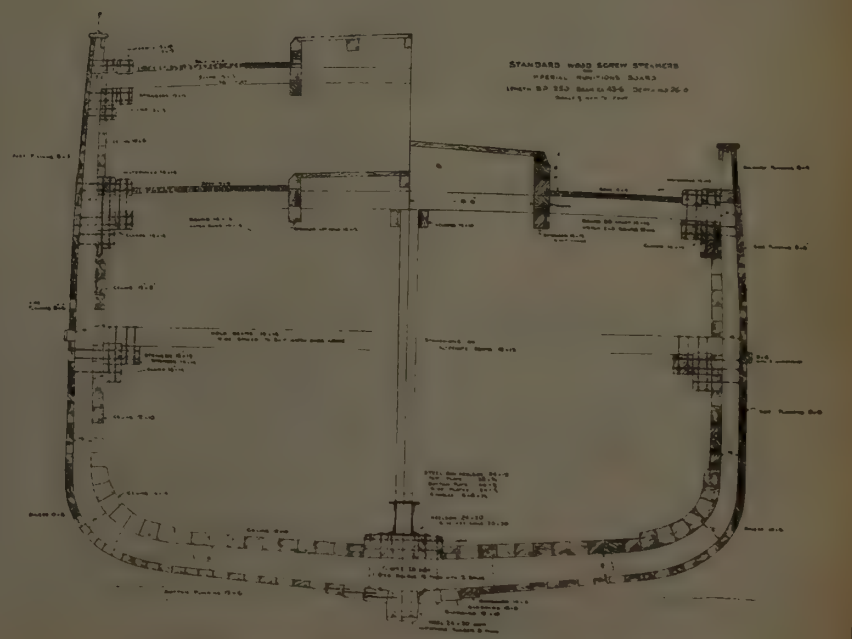
Deadwoods, Rudder Posts, Propellor Posts, Backing Piece—To be good grade similar to waterways, stem and apron, shall be sound, strong lumber free from large and loose knots. Will allow a small amount of sap on all four corners.

Shaft Log—This will probably be ordered in two pieces of 18 x 36 —12 and must be practically clear, straight grained. No sap.

Framing—This material wants to be sound strong lumber. May show wane on all four corners when not extending one-quarter of the length from each end. Will allow any amount of large knots and must be supplied as lengths are called and not in multiples.

Cross Bands—These pieces are to be used in holding the frames together when erected and must be supplied in good strong small knotted lumber. Defects of the piece to be considered in the length of the piece. Sap no defect.

Ribbons—This material may be supplied in hemlock at your option. Must be practically clear, straight grain to stand bending.



Midship section of 2500 ton wooden steamer.

May show any amount of sap and 2 inch face wane on edge or may show wane on both edges.

Promiscuous Common—Shall be ordinary common as supplied to Rail Trade.

Beams—This must be selected strong, small knotted. The fact that these pieces will be dressed four sides must be considered. Grade to be about equal to staging plank.

Decking—To be well sawn and show one edge grain face and calking seam edge free from defects. Under side and lower half of calking edge may show much defects that will not impair its strength.

It is generally understood that the complete specifications excepting the framing must be practically free from sap.

Ships Now Under Contract

The latest list available of contracts let by the Imperial Munitions Board for Standard wooden vessels is as follows:—

Wallace Shipyards, Vancouver, B.C.	6
Foundation Co. of British Columbia, Victoria, B.C.	5
Western Canada Shipyards, Ltd., Vancouver, B.C.	6
Lyall Shipbuilding Company, Vancouver, B.C.	6
New Westminster Construction & Eng. Co., Ltd., New Westminster, B.C.	4
Pacific Construction Company, Coquitlam, B.C.	2
Cameron-Genoa Mills, Victoria, B.C.	4
Quebec Shipbuilding & Repair Company, Quebec.	2
Grant & Horne, Ltd., St. John, N.B.	2
Quinlan & Robertson, Quebec.	4
Three Rivers Shipbuilding Co., Three Rivers, Que.	2
Fraser Brace & Company, Montreal, Que.	4
Toronto Shipbuilding Company, Toronto, Ont.	2
Port Arthur Construction Co., Port Arthur, Ont.	2
Total	51

The above vessels are being constructed under contracts placed by the Imperial Munitions Board for the British Ministry of Shipping. Col. Wm. I. Gear, J.P., vice-president of the Robert Reford Company, Steamship Agents, Montreal, has been appointed Director of Steel Shipbuilding by the Board and has an office in the Transportation Building, Ottawa. The wooden shipbuilding in eastern Canada is being handled from this office. In British Columbia the wooden shipbuilding programme is in charge of Mr. R. P. Butchart, Victoria, B.C., who has been appointed by the Board, with the title of Director, and has established an office for this purpose at Vancouver. Mr. J. W. Troup, manager of the B. C. Coast Steamship Service of the C. P. R., has been loaned by that company to assist Mr. Butchart, and has been appointed Assistant Director.

The general plan of operations followed by the Imperial Munitions Board in connection with these contracts is as follows:—The Board takes over the shipbuilding yard and plant which are furnished by the company. The timber and other supplies are purchased and furnished by the Board, although in some cases this material is furnished by the company, but has to be entirely approved by the Board. Wages and other operating expenses are paid for by the Board. The contracts with the shipbuilding companies are simply for the construction of the hulls. Other arrangements are being made in regard to machinery, equipment, etc. When the hulls have been launched and the contracts completed, a bonus is paid by the Board to the company, which practically amounts to a payment for the use of their yard, equipment, etc., and for the services of the company's office staff.

After completion, the trials of these vessels are to consist of a 6-hour set run at full power, and the builder must guarantee workmanship and material for six months after delivery. Everything is to be supplied to complete the vessel as a full sea going ship to Lloyd's requirements and to the Board's satisfaction.

Sizes of Timbers Required for Shipbuilding

Victoria Lumber and Manufacturing Company's Operations Devoted to Getting Out High-Class Material Needed

The Victoria Lumber and Manufacturing Company, Ltd., Chemainus, B.C., is one of the most favorably situated companies in British Columbia for taking out ship timbers. The company is devoting every effort to fill the demand for this class of material. The capacity of its plant is about five million feet a month. By using every piece possible from selected timbers the company is cutting about 800,000 feet a month for shipbuilding purposes.

The material the company is turning out for shipbuilding is as follows:

Beams—12 x 12 to 18 x 18, in lengths 16 ft. to 42 ft.

Garboards—10 x 18, 9 x 16, 8 x 14, in lengths 30 ft. to 70 ft.

Planking—5 x 8, 6 x 8, 6 x 10, 6 x 12, 9 x 16, in lengths 40 ft. and up (averaging 50 ft.).

Ceiling clamps and waterways—3 x 10, 5 x 12, 5 x 14, 5 x 16, 4 x 12, in lengths 40 ft. and up (averaging 50 ft.).

Framing timbers—12 x 14 to 12 x 36, in lengths 16 ft. to 29 ft.

Clear decking—4 x 4 and 5 x 5, in lengths 20 ft. and up (averaging 30 ft.).

Keels—20 x 24, length 76 ft.

Keelsons—20 x 20, lengths 46 to 80 ft.

Stern—18 x 21, length 42 ft.

Skid log—14 x 24, length 40 ft.

Filling piece—12 x 24, length 36 ft.

Backing piece—24 x 24, length 8 ft.

Rudder post—24 x 24, length 10 ft.

Horn timbers—12 x 12, length 38 ft.

Stern rim—18 x 30, lengths 10 and 15 ft.; 18 x 32, length 16 ft.

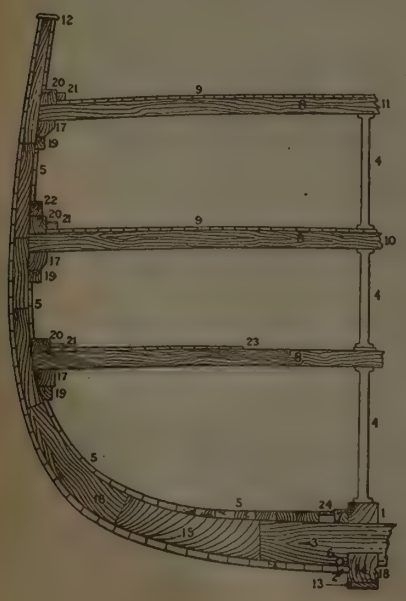
Apron—24 x 28, length 38 ft.

Shaftlog—18 x 36, length 10 ft.

Stern post—30 x 32, length 20 ft.

Forefoot—22 x 44, length 12 ft.

The company secures the material from timber, logged from its own timber lands. It operates its own logging camps and railways.



A Wooden Vessel's Parts

The principal parts of the hull of a wooden ship, as illustrated in Webster's Dictionary, are as follows:—1 Keelson; 2 Garboard Strake; 3 Floor or Floor Timber; 4 Pillar or Stanchion; 5 Ceiling; 6 Limber Hole; 7 Sister, or Side Keelson; 8 Beam; 9 Deck Planking; 10 Main Deck; 11 Upper Deck; 12 Rail; 13 False Keel; 14 Keel; 15, 16 First and Second Futtock, etc., forming the frame; 17 Shelf Piece; 18 Rabbet of the Keel; 19 Beam Clamp; 20 Waterway; 21 Inner Waterway; 22 Spirketing; 23 Partial Hold Deck, the planking extending as far as the figure, 23; 24 Limber Board.

Shipbuilding is amongst the most ancient of arts. As in the idea of bridge-building, the idea for a ship was probably suggested by the floating of a falle ntree bearing some animal upon the water. So, proceeding by way perhaps of logs tied together to make a raft and by means of a hollowed tronk, canoes and coracles were naturally evolved.

The first ship boilt of which we have any description is Noah's Ark. Assuming a cubit to be 18 inches, then the Ark was 450 feet in length, 75 feet in beam, and 45 feet in depth. It was built of gophir wood, or of cypress, and it is worthy of note that in the time of the Greeks this was found, by practical experience, to be, like cedar, eminently suited for parts of a ship under water.

The idea of propelling ships independently of the wind obviously first lead to the use of manual labor in the use of oars. The discovery of the use of steam as a means of propulsion of land vehicles soon lead, naturally, to attempts to utilize it on behalf of floating vessels. It is claimed that the first attempt at this propulsion was made by Blasco de Garay, a Barcelona, in 1583.

Col. J. B. White, in charge of the Canadian forestry operations in France, has returned to Canada on leave. Col. White was very active in raising forestry battalions for England and France.

Wooden Shipbuilding In British Columbia

Thirty-Three Vessels to be Turned Out for Imperial Munitions Board—Other Ships Also Under Contract—Great Activity in B. C. Yards

By A. F. Menzies, M.E.

A. F. Menzies, M.E.

The first ship that was built in British Columbia was undoubtedly a dugout canoe, designed and constructed by an Indian. It was hewn from a log cut in the same forests that are now supplying timber for the wooden ships that are helping to beat the Kaiser.

Until the present extensive shipbuilding programme was undertaken this branch of industry had a precarious existence in British Columbia. Ships, and good ones, too, had been built, both in steel and wood; but the builder had always been fighting long odds.

A large number of internal combustion engined craft had been built, and a few years ago the waterfront at Vancouver accommodated numbers of small yards turning out these craft. They ranged from large and elaborate pleasure cruisers to good sized halibut fishing boats and tugs.

Several steel tugs had been produced, as well as a few ferry and coastwise passenger boats, both in steel and wood. The large fleet of wooden tow boats employed in log and other towing operations were all built locally, in some cases both hull and machinery.

Probably no other country has had such a remarkable growth as British Columbia. It is only a few years since logging operations were being carried out on the sites of the present yards. On the Indian Reserve, in North Vancouver, one can always see a dugout canoe in some stage of construction. And from the Reserve an excellent view of the Lyall Shipbuilding Company's plant can be had.

Plenty of Perfect Timber to be Had

The forests of Douglas fir, with which British Columbia is so well supplied, yield excellent timber for shipbuilding. Sticks as large as 36 inches square by 66 feet long; 18 ins. by 24 ins. by 99 ft.; 20 ins. by 24 ins. by 80 ft. have been cut without sapwood, or other defects. The following, taken from Mark's Engineers Handbook, goes to show that Douglas fir is not lacking in strength.

	Structural Sizes	
	Modulus of Rupture	Lbs. per sq. in. bending
	Air dried	Green timber
Douglas fir	6372	5983
Longleaf pine	5749	6099

A table of maximum spans for wooden beams from the same authority gives Douglas fir a slight advantage over longleaf pine.

For interior work, side grain fir, properly stained, gives a beautiful finish. As to its lasting qualities, if cut in the right season and properly air dried and reasonable care taken in design to see that complete ventilation is possible and that salt pockets are provided, little danger need be apprehended. Of course, like all similar woods, fir is attacked by the toredo if not protected by copper paint, creosote, or other protective coating.

The extensive wooden shipbuilding programme undertaken in British Columbia by the Imperial Munitions Board calls for 27 ships, and to build the ships alone over 40,000,000 feet of lumber will be required. This lumber will vary greatly in size; but must be all select quality. Getting out this material is going to give the mills quite a jolt, but, as one prominent mill manager expressed it, "It is good business, and we are going to take care of it." On account of the high quality of lumber required for shipbuilding purposes a large quantity of a lower quality will be made available.

The sawmills are the oldest mainstay of British Columbia's commerce, and there is no doubt but that they will respond to the Nation's cry for ships, and will furnish the quality and quantity.

British Columbia's Wooden Ship Programme

The 33 wooden ships contracted for by the Imperial Munitions Board are designed to take the highest classification in Lloyd's Register of Shipping. The designs have been worked out by men well versed in the design and operation of all classes of shipping. The length of the boats was decided on as being about the limit it would be advisable to go without recourse to extensive steel diagonal strapping. It was considered better to obtain a relatively larger number of slightly smaller boats than to increase the size and place another load on the already suffering steel market.

These boats are of the well decked type with the poop extended to the bridge deck. They are 250 feet long B. P. by 42 ft. 6 ins. moulded beam by 25 ft. moulded depth. The carrying capacity on a 21 ft. draught of water is about 2,800 tons.

The hull is divided into several compartments by watertight bulkheads, which will materially assist in keeping the vessel afloat should it become damaged. About one and a half million feet of lumber is required for each boat, while for caulking the seams over 350 bales of oakum will be required. For fastenings, galvanized spikes of various sizes, and bolts, both screw and drift, will be required in immense quantities. The following brief description of the more important timbers will give an idea of the sizes of lumber used.

The keel is in four pieces, all 20 ins. by 24 ins., and from 54 ft. to 76 ft. in length. The various lengths being joined together with scarphs 12 ft. long. The keelson is also 20 ins. by 24 ins., and the sister keelsons 20 ins. square. These sticks are in as long lengths as is practicable, and the scarphs are carefully shifted in order to maintain the maximum possible strength throughout. On the top of the wooden keelson there is a steel box girder keelson consisting of top and bottom plates 25 ins. and 40 ins. by ¾ in. respectively, web plates 24 ins. by ½ in., all secured by 6 in. by 6 in. by ½ in. angles.

The frames are doubled 12 in. sided and are tapered from 24 in. at the keel to 11 in. at the main deck. They are spaced 3 ft. centres. There are three garboard strakes, the first being 18 ins. by 10 ins. The planking is all 6 in.

The ceiling in the bottom is 12 ins. by 10 ins., on the turn of the

Plant of Pacific Construction Company, Limited, Port Coquitlam, B.C.—View showing some of the timbers used for framing wooden ships.

Placing the frames—Reel forms ready nearby for another vessel—Pacific Construction Company, Limited, Port Coquitlam, B. C.

bilge 14 ins. by 14 ins. and 12 ins. by 10 ins. and 8 ins. on the sides. In order to avoid local weak spots the butts of the planking and ceiling are well shifted.

On the line of the hold beams there are two stringers each 14 in. by 16 in. and one 14 in. square clamp. The main deck stringer is composed of three strakes of 14 in. by 14 in. These sticks are also in long lengths.

The main deck beams are 14 in. by 14 in., spaced 3 ft. centres, that is, one on every frame. The main deck is of 4½ in. by 4½ in. edge grain. Edge grain timber is used for decking on account of its wearing qualities, also there is no tendency to sliver. The narrow planking is preferable on account of the lessened amount of contraction and expansion to be taken care of at each seam. The upper deck is 3½ in. by 3½ in., also edge grain.

The propeller post is 30 in. moulded by 24 in. sided, being swelled to 32 in. at the shaft line. The shaft log, another large piece, is composed of two pieces of 36 in. by 18 in. To bracket the various parts together a large number of natural knees are used.

There are three cargo holds and one deep tank for water ballast, the holds and tanks being separated by watertight bulkheads. The cargo holds are served by six steam winches operating through 5-ton derricks.

Machinery Equipment

The propelling machinery consists of one set of triple expansion engines which will develop about 1,000 I.h.p. The cylinders are 20 in., 33 in. and 54 in. diameter, having a common stroke of 40 in. The engines are of the usual marine type with a built-in condenser and lever-driven pumps. The crankshaft is built up and is in three interchangeable sections, the diameter being 11⅛ in. A cast iron stern tube will be fitted to carry the propeller shaft through the shaft log. The tube will be provided with a brass bush lined with lignum vitae to form a bearing for the brass liner on the shaft. Lignum vitae, or "Wood of Life," is almost universally used for this important bearing. It contains a natural lubricant; and, when the wear comes on the end grain, lasts for years before appreciably wearing down.

The boilers are to be of the "Howden" water tube type, fitted with a system of heated, forced draft. The draft is obtained from a fan which forces the air round a series of tubes through which the waste gases are passed on the way to the funnel, thus heating it. The heat thus obtained is a clear saving, as otherwise it would have gone up the funnel.

The contracts for the hulls, engines, and boilers are let to different firms, while the work of installation is to be undertaken by the Imperial Munitions Board themselves. For this purpose a large assembly plant is now under construction at Ogden Point, Victoria.

By December several of these boats will be launched, and the middle of 1918 will see the last of the contracted number off the builders' ways.

British Columbia's Shipbuilding Plants

Until recently there were three British Columbia concerns of size engaged in shipbuilding and repairing, both in steel and wood, besides the several smaller concerns engaged on wooden construction only.

A few years ago, Mr. N. A. Yarrow, of the well-known Old Country shipbuilding family, took over the B. C. Marine Railways Company plant at Esquimalt. The old concern had several vessels to their credit, notably the "Nanoose," a 116 ft. tug for the Canadian Pacific Railway Company, the machinery, compound engines 17 in. and 40 in. by 27 in., was also produced by the firm. The "Princess Maquinna," a high class passenger boat, was turned out for the same company. This vessel is 232 ft. 6 in. by 38 ft. by 14 ft. 5 in., and is propelled by triple expansion engines. The "Princess Royal," also a C. P. R. coastwise passenger boat, is another of this firm's products. Some steel barge work on the longitudinal framing system had also been done.

The plant is located near the Esquimalt navy yard, and large repair jobs were often carried out in the Admiralty graving dock. Smaller repairs, and some also of considerable magnitude, were done on the marine railway at the company's plant.

The B. C. Marine Limited, of Vancouver, was at one time a branch of the Esquimalt concern; but on the latter being taken over by Yarrows Limited, became a separate business under the guidance of Mr. Geo. Bushby, who had been local manager for some time.

Yarrows Limited have gone in extensively for the construction of shallow draft vessels for use in Indian waters. These craft have been completely erected at Esquimalt and taken to pieces for shipment.

The Wallace Shipyards Limited

Perhaps the best known figure in shipbuilding circles in British Columbia is Mr. A. Wallace, the moving spirit of the Wallace Shipyards Limited, of North Vancouver. This concern has developed from very small beginnings to receive the honor of building the first deep set steamer in British Columbia, and the firm was in receipt of many congratulations when the representatives of the Imperial Munitions Board took over the S.S. "War Dog."

This vessel was numbered 91 on the company's records, the previous numbers having been bestowed on various craft, including a steel tug 100 ft. long for the Dominion Government Public Works Department, and a couple of large ferries for the city of North Vancouver.

In the past the Wallace Yards have gone in extensively for repair work of all classes, a lot of deep sea work being handled, as well as the local boats. The yard is equipped with two marine railways, the larger of the two being capable of hauling out vessels up to 2,000 tons and 260 feet long. Both the ways are kept constantly busy. At the time of writing the smaller ways were occupied by the "Cassiar," a wooden steamer owned by the Union Steamship Co., which found to her cost that British Columbia rocks are hard. She requires a new stem and repairs to her stearn. The large ways accommodated the Dominion Dredge "Mastodon," which was undergoing her annual overhaul. Extensive repairs are being made to her bucket chain, while the 100-ton sheer legs on the end of the wharf were utilized to lift down some of the upper gearing, on which a new friction is to be fitted.

A reconstruction job of note was also under way, the steel steamer "Bowler," originally the "Safiro," which after a chequered career of 33 years is to be placed in commission again as an auxiliary power vessel. The hull plating was badly pitted and it was decided to apply wood planking to the outside. The top sides were done while the vessel was afloat, under the supervision of Capt. McKenzie, a well-known Vancouver shipping man, while the under water portion is being carried out by the Wallace Yards.

In order to be better fitted to carry out work expeditiously this yard is putting in a modern foundry, construction of which is now under way. The foundry is located on Industrial Island at the mouth of False Creek. This island is reclaimed ground made by the Vancouver Harbour Commissioners, and is being leased by them at very moderate rentals, for industrial purposes. Several other con-

The "Margaret Haney"—Deck view during construction—Built by the Cameron-Genoa Mills Shipbuilders Limited, Victoria, B. C.

cerns have plants on the island, either completed or under construction.

The machine shops of the Wallace Shipyards is a very busy place. In addition to engines for the steel vessels they are building, they have orders from the Imperial Munitions Board for three sets of engines for the wooden ships; also a quantity of rudders and other equipment for the same. The machine shop force was quite proud of its work on the War Dog's engines, these being the first marine engines of any size constructed in the province. The excellent showing made on the trial trip was certainly a consolation for the grief which must have been experienced at times during construction.

The War Dog, being the first ocean-going steamer constructed in British Columbia, naturally created quite a lot of interest. She is a steel well decked cargo steamer 300 ft. long by 45 ft. beam moulded and carries 4,700 tons on a 22 ft. 7 in. draft.

The propelling machinery consisted of a set of triple expansion engines, developing about 1,300 indicated horse power. The cylinders were 24 in., 38 in. and 62 in., with a common stroke of 42 in. The working pressure being 160 lbs. per sq. in.

One of the illustrations shows the War Dog being launched on the 17th of May last. It will be seen from the illustration that the building berth is spanned by a wooden gantry which carries an electric travelling crane. The berth is now occupied by another ship of similar type which will be launched shortly. This vessel's dimensions are similar to the War Dog; but some of the details of design have been altered at the request of the Imperial Munitions Board.

Wallace Shipyards Plant No. 2 was organized to construct six auxiliary schooners for the Canada West Coast Navigation Company. This plant was located on the Fell Fill, a piece of made ground at the foot of Bewick Ave., North Vancouver. The schooners are of the type shown in the illustration of the Mabel Brown. Five of these vessels have been delivered and placed in commission by the owners. They have all carried lumber to various foreign ports. The sixth boat, the "Marie Barnard," was launched on September 29th, and is now being fitted out.

These schooners have a deadweight capacity of 2,550 tons, or 1,500,000 feet of lumber. Those which have had time to complete a voyage have given an excellent account of themselves. They were designed by Mr. J. H. Price, who is now identified with the Cameron Genoa Shipbuilding Company, of Victoria. The boats are of the five-masted, bald headed type, and are 253 feet long by 44 feet beam by 21 feet deep. In their construction about 1,300,000 feet B.M. of lumber was used per boat. While the mainstay for propulsion is the sails, they are all equipped with two 160 b.h.p. Bolinder hot bulb engines, for use in calms and in making port. A speed of from 7 to 8 knots is obtained with the engines alone.

The construction of these boats, as well as a similar number by the Cameron Genoa Company, was undertaken for the Canada West Coast Navigation Company, under the Shipbuilding Bill passed by the late Bowser Government. The total cost of construction has been over $3,000,000, and the resultant gain in tonnage over 30,000.

The No. 2 yard has recently been sold to the Lyall Shipbuilding Company, which will be referred to later. The original concern, however, undertaking to finish the schooner contract.

The third old established shipbuilding company, the Victoria Machinery Depot, has not gone extensively into the present boom. Having a large and well equipped machine shop they were kept exceedingly busy on shell contracts for the Imperial Munitions Board, being the general contractors for the Victoria district.

Besides carrying on an extensive repair business, this firm have several good vessels to their credit. They have also turned out several stern wheel steamers for the up-country rivers and lakes, some of these boats being quite heavily powered.

The Victoria Machinery Depot has recently received an order from the Imperial Munitions Board for a number of "Howden" water tube boilers for use in the wooden steamers.

The recently established yards, with the exception of J. Coughlan & Sons, are all engaged on the wooden ship for the Imperial Munitions Board. The Cameron Genoa Company, of Victoria, who are just completing a six-schooner contract for the Canada West Coast Navigation Company, have four of them to build. The schooners are duplicates of those built at the Wallace No. 2 yard and are for the same owners. The fifth boat was launched recently and is now at the buiders' sheerlegs, having the masts stepped. The sixth vessel will be off the building berth soon and then the four berths with which the yard is equipped will be available for wooden steamers. The wooden steamers in the other three berths are well along, being almost completely framed, and on one, planking has been commenced. In fact, excellent progress has been made by all the yards engaged on the wooden steamers in getting away to a surprisingly quick start. This pace, which there is no doubt will be kept up, is an object lesson to those critics who decried the wooden steamer idea. Had these boats been built of steel, the material, could it have been obtained at

Cameron-Genoa Mills Shipbuilders Limited, shipyard at Victoria, B. C., showing three auxiliary five-masted schooners and one wooden steamer (on the right) under construction for the Imperial Munitions Board—Photo taken on Sept. 8th, 1917.

all, would not have been on the ground yet, and we would have been just that much longer in obtaining the tonnage.

When the four Imperial Munitions Board boats are delivered the Cameron Genoa Company will have the respectable total of 26,500 tons to their credit.

Foundation Company's Operations

Close to the above plant the Foundation Company are busy on a five-steamer contract and have their boats all well advanced. There is considerable rivalry between these two yards as to who will launch the first boat. At present there is hardly a day's work between them. It must not be thought that, on account of youth, these concerns engaged on the wooden steamers are of the mushroom, fly-by-night type. All the firms to which the Imperial Munitions Board have entrusted contracts are backed by solid business men, some of them being well-known from coast to coast.

Both these yards are equipped with crane-type derricks for handling the heavy timbers. The derricks consist of a stout vertical mast securely guyed. At a sufficient distance below the point of attachment of the guys to give clearance to its outer end the horizontal boom is secured. The boom is able to swing in a complete circle and being fitted with a travelling carrier can cover a complete circle, the diameter of which is twice the length of the boom. The hoisting winches are located well back from the building berths, enabling the operator to see signals plainly from the men engaged in placing the sticks.

The Westminster Construction and Engineering Company have four Imperial Munitions Board wooden ships to get out at their yard at Poplar Island, New Westminster. This concern sprang from a combination of the Westminster Marine Railway Company and the B. C. Construction and Engineering Company. Mr. S. Dawe, of the former concern, is general manager of the new venture. The site of the yard is on the upper end of a small island in the North Arm of the Fraser River, and is leased from the Dominion Government. To get supplies in conveniently a private bridge was constructed connecting the plant with the city of New Westminster.

A well equipped plant with four building berths has been installed, and Mr. Dawe expects to have no trouble in completing his work on time. To raise the level of the site above high water mark of the river a quantity of sand was pumped in by the Dredge King Edward, a 20-in. hydraulic dredge operated by the Public Works Department of the Dominion Government. As the sand was removed from a shallow spit running out from the island a double purpose was served.

Injecting new life into a defunct yard was the job undertaken by the Pacific Construction Company when they took over the Coquitlam Shipyard. The two wooden steamers which they are constructing are well under way. Mr. J. L. Davidson and Mr. Stuart Cameron are president and vice-president respectively, while Mr. H. P. Simpson is in active charge of the work.

The plant is supplied with power by the Western Canada Power Company, whose high tension transmission lines from the power house at Stave Lake pass the site on their way to Vancouver.

While this concern has only two ships under contract at present, the yard has available water frontage to accommodate ten building berths.

The Lyall Shipbuilding Company

The Wallace Shipyards Plant No. 2, which was recently taken over by the Lyall Shipbuilding Company, is now equipped with six building berths, and, as the last of the auxiliary power schooners contracted for by the original concern was launched on September 29th, all the berths will be occupied by Imperial Munitions Board work. Four of these vessels are well under way, two of them being completely framed, two nearly as far advanced, while the keel blocks are ready for the fifth and sixth. A spur track from the Pacific Great Eastern Railway, which runs along the foreshore directly behind the plant, supplies it with railroad facilities.

The Western Canada Shipyards are located in the heart of the city of Vancouver, on a site occupied for a long time by the Royal City Sawmills, which were destroyed by fire a few years ago. This concern was organized by Messrs. Armstrong, Morrison & Company, the well-known Vancouver contractors, who have built several notable bridges in the province. Excellent progress is being made on the six wooden steamers contracted for with the Imperial Munitions Board. These boats, together with those built at Coughlan's yard, on the south side of False Creek, will be launched into the deep water channel which has been dredged in the creek by the Pacific Dredging Company, under contract with the Dominion Government.

The largest shipbuilding undertaking in the province is that organized by J. Coughlan & Sons. This firm has been extensively engaged in the fabrication and erection of modern office buildings, as well as operating a brick yard at New Westminster. Recently they have established a large yard for the construction of steel ships, on the south side of False Creek.

Contracts have been accepted for the construction of six vessels of 8,800 tons D. W. The yard has accommodation for four vessels at a time and naturally all the berths are engaged. These boats will be propelled by geared turbines which are being built in the east. The boilers, however, will be constructed in the boiler shop which the firm has under construction beside the shipyard.

No industrial enterprise can be undertaken without causing ripples on the commercial ocean. In regard to shipbuilding, apart from the actual construction of the ships, large quantities of what are finished products to other lines are used.

The auxiliary machinery for a ship is quite an item. Winches and capstans for British Columbia's ships are all being built locally. The Terminal City Iron Works, of Vancouver, supplied the winches for the Canada West Coast Navigation Company auxiliary schooners. These winches are of the central valve type, being handled by one lever, and, when properly arranged on deck, one man can handle two winches.

The North Shore Iron Works, a North Vancouver concern, has developed a winch on the lines of the celebrated Clark Chapman type. This firm supplied the winches for the War Dog and have received further orders from the Wallace Shipyards. The Imperial Munitions Board has also placed orders with them for winches for their wooden steamers.

Steering gears, a very necessary and, to a certain extent, a complicated piece of machinery, for the wooden steamers, are being constructed by the Schaake Company, Limited, of New Westminster, and Yarrows Limited, of Esquimalt. The former concern has been for the past two years engaged in the machining of high explosive shells. The latter has already been referred to.

Forgings, which form an important part of any ship, have, until recently, been rather difficult to obtain in British Columbia. The Vancouver Forge Company have been organized to meet this difficulty, and are now in a position to get out all classes of heavy and light forgings. Among other equipment installed at their forge at Victoria Drive are two large steam hammers, two oil furnaces and a number of open fires, cranes, of course, being provided for handling

Launch of the "War Dog"—the first ocean going steel steamer to be built in British Columbia.

the heavier pieces. This shop is at present busily engaged on rudder and winch forgings for the Imperial Munitions Board.

In order to be in a position to supply large marine boilers, the Vulcan Iron Works have built a modern boiler shop on Industrial Island. A complete equipment of tools has been installed, including a set of rolls capable of bending the heaviest plates used in boiler construction; a hydraulic flanging machine and a hydraulic rivetter.

This firm has, for a number of years, been engaged in the building of boilers, tanks, etc., at their New Westminster shops. A job of considerable size handled by them was the installation of several pipe lines for the Vancouver Power Company at the No. 3 Lake Buntzen hydro-electric plant.

The Vulcan Iron Works have a good order to start their new shops on. They have a contract with the Wallace Shipyards to supply the boilers for the latter's steel ships. These boilers are 15 ft. 6 in. diameter by 11 ft. 3 in. long, and are to carry 180 lbs. per square inch working pressure. The shell plates are 1 11/32 in. thick and a completed boiler will weigh approximately 45 tons.

British Columbia's Shipbuilding Future

That British Columbia will eventually, if she has not already become, a prominent shipbuilding province is a certainty. It may be said that there are three necessities to any enterprise. The place, the nerve and the materials. The splendid natural harbors and rivers of British Columbia are unequalled as locations for shipyards. The nerve of the British Columbia business men has never been questioned. The previous reference to the forests tell of the ample supply of excellent timber. Douglas fir will afford sticks of the largest size required for the construction of wooden ships and beautiful finishing material for the interior of steel boats.

In the ordinary course of events steel is the most suitable material for shipbuilding, and, while British Columbia has at present no steel plant producing iron ores, the ore is here, also the coal from which to make the coke necessary for smelting purposes. Limestone, which plays an important part in the production of pig iron, is also available. It is true the visible iron ore is a magnetite; but who will say science will not evolve a suitable method of reducing it. The ore, the coal and the limestone are all available within short distances of each other and close to tide water. These three gifts of nature, conveniently located, plus nerve, played an important part in making Great Britain what she is. So why should British Columbia not do likewise?

Next to steel, copper, alloyed with other metals, is perhaps the most important metal necessary for shipbuilding. The following figures, supplied by Mr. E. A. Haggen, editor of the Mining and Engineering Record, give an idea of British Columbia's capabilities in this direction.

Production for the year 1916.

	Quantity	Value
Lead, pounds	48,727,516	$3,007,462
Copper, pounds	65,379,364	17,784,494
Zinc, pounds	57,168,980	4,043,985
Coal, long tons	2,084,093	7,294,325
Coke, long tons	267,725	1,606,350

Another of British Columbia's natural resources which will play a larger part in the construction of the ships of the future is the immense water powers. The country is mountainous and the higher levels receive a large amount of snow, which, melting as the seasons change, forms a natural storehouse of power.

Victoria is served by the British Columbia Electric Railway Company from their plants at Coldstream, where 22,200 kw. electric energy is available. Vancouver and New Westminster are supplied by the same concern and also by the Western Canada Power Company, who have plants at Lake Buntzen and Stave River Falls respectively, aggregating 83,200 kw., and as much more capable of easy development. The amount of water power at present utilized is small compared with that available within reasonable distance of the large centres of population.

To build ships, labor is essential, and in competitive times British Columbia has been handicapped in that it is a new country and living is expensive; consequently high wages, comparatively prevail. In times like the present this is not felt; but, on return to normal, this phase will have to be squarely faced. It is not likely, however, that the benefit of the excellent start will be lost and the future will probably see British Columbia building ships with British Columbia products, from forest and iron ore to trial trip, and loading them, too.

Steam Trawlers and Drifters

The Dominion Government is having built in Canada, 36 steel steam trawlers, and 100 wooden steam drifters, of standard British types. The trawlers will be about 125 ft. long between perpendiculars, 23 ft. beam, and 13½ ft. deep. They will have triple expansion engines of about 500 h.p. The work of having these vessels built has been delegated, by the Naval Service Department, to J. W. Norcross, vice-president and managing director, Canada Steamship Lines, Ltd., Montreal, who is acting as Director of Naval Construction, and is being assisted by three of the company's other officials, W. E. Burke, Assistant Manager; F. S. Isard, Comptroller; and H. W. Cowan, Operating Manager. The orders are being distributed among existing shipbuilding plants from Quebec to Port Arthur, and it is probable that one or more plants which have not been in operation for some time will also be utilized. The materials, including engines and other machinery, are bought by the department and supplied to the builders.

The steam trawlers and drifters are built on typical British lines, and are from 110 to 150 ft. long, according to the fishing grounds which it is intended to work. The vessel is rigged with two masts and carries mainsail, mizzen-sail and foresail.

Steam herring drifters are used, around the coast of Great Britain, in the herring fisheries. The modern steam drifter is a smart, sturdy, little craft with two masts, fore and mizzen, the foremast being arranged to lower when the vessel is drifting with the nets, so as to offer less wind resistance. The majority of steam drifters are now built of steel (but those to be built in Canada will be of wood) and vary from 80 to 99 ft. between perpendiculars by about 18 ft. breadth and 9½ ft. depth to top of keel. They are fitted with compound surface condensing engines of from 200 to 250 i.h.p. and attain a speed of from 9 to 10 knots.

The Minister of Marine recently stated that the work on these vessels is progressing satisfactorily, but not as rapidly as had been hoped for. There is difficulty about getting engines and boilers, which has caused delay. A number of vessels have been launched, and it is hoped to have a number of them in patrol service in such places as the British Government desires to place them. The work is being performed in a number of places in Canada. In Quebec it is being done by George Davie, of Levis, in Montreal by Canadian Vickers, Limited, and in Toronto by Norcross and Polson. Work is also being done at Collingwood and Port Arthur, and other points.

Shipbuilding in the Maritime Provinces

Nova Scotia the Pioneer Province — Important Industry in New Brunswick— Romance of the Early Days—the Modern Revival

Written specially for the Canada Lumberman by Elihu Woodworth

THE wooden shipbuilding industry in America was first established at Port Royal, now Annapolis, and, so far as this continent is concerned, may be said to have originated there. Haliburton, in his History of Nova Scotia, tells us that in the summer of 1606 "a barque and a pinnace" were built and launched at Port Royal by Pontgrave. No details concerning the dimensions of these vessels are given, but it may be assumed that they were strongly built and of considerable size, for they were designed to carry back to France Pontgrave and the other settlers who had spent the preceding winter at Port Royal. Pontgrave embarked all his people, except two men who were left in charge of the fort, and they "had set sail and were on their way to France," but they put back to Port Royal on learning that the "ship Jonas" from France "had been spoken off Canseau." Pontgrave returned to France a month later on the Jonas, leaving Poutrincourt in command of Port Royal. Poutrincourt, in command of the barque, made a voyage to Cape Mallibare, now known as Cape Cod, and we are told that "the barque was leaky," and that "having injured the rudder of his vessel," he entered a harbor and erected a forge in order to make repairs. He appears to have succeeded in his efforts, for he returned to Port Royal "in the barque" on the 14th of November, 1606, to join the order of "Le Bon Temps." Next year he "employed his marque in small voyages about the bay to trade for furs," and Murdock tells us that "He also built two barques, and, having no pitch, he collected the gum of the fir trees, caused bricks to be made, contrived a furnace, also an alembic made up of several kettles, and distilled this gum into pitch." In August of that year Poutrincourt embarked all the settlers on his vessels and voyaged to "Canseau," where they joined the Jonas and returned to France. This is a condensed account of the beginning and end of the first shipbuilding enterprise in America of which we have any record, and there is certainly good reason for believing that Nova Scotia is entitled to be considered the pioneer of American shipbuilding. Pontgrave built and launched his vessels one year before the first permanent British settlement was established at Jamestown, Virginia, and two years before Champlain founded Quebec. Hudson discovered the river which was named for him in 1614, and it was half a dozen years later before the Mayflower, with her cargo of furniture and first families, arrived at Plymouth Rock. Even if other settlements had been made before the one at Port Royal, it is not likely that much shipbuilding would have been done, for the first settlers were sadly lacking in facilities for such enterprises. Timber of all kinds was abundant, but it is not at all likely that there was a large stock of canvas and cordage, of cables and anchors. Presumably Pontgrave, like Poutrincourt, had no pitch, and this no doubt explains why his barque was leaky on her first voyage. Under such conditions as then existed it is not surprising that the settlers built few vessels; the wonder is that they succeeded in building any.

There is no record of any further shipbuilding in America for many years, but there is no doubt that, with improved facilities for construction, vessels were built by the colonists from time to time as they were required. That they were built in considerable numbers seems evident from the fact that in 1690 Sir William Phipps, of New England, who had recently taken possession of Port Royal, set sail on an expedition to capture Quebec with "some thirty-two ships in all and over two thousand men." The failure of the expedition involved the people of Boston, who were probably the builders and outfitters of the fleet, in "a heavy financial loss."

It is not surprising that the North American colonists soon developed into a shipbuilding and seafaring people. They came from maritime countries where they had always been accustomed to ships and sailors; some of them probably had been seamen or were descended from seamen, and no doubt there were some shipwrights among them. They settled near the coast where timber was abundant; they had plenty of more or less skilled labor and they needed ships. What was to prevent them from building vessels suited to their wants, and from manning and navigating them after they were built? Take Nova Scotia, for instance, with her numerous harbors, her abundant and excellent timber, her coasts swarming with fish, and with shipping as the easiest if not the only way of communicating with neighboring settlements. Vessels were needed for trading and fishing, and we may be sure that the required vessels were built. These, at first, were small coasters and fishing craft, but when the settlements grew larger and their wants increased larger vessels were built for trading with United States ports and the West Indies. Then, too, shipbuilders found that their vessels had a market value, and many a sturdy craft was turned off as a business speculation. In the early years of the nineteenth century it was not uncommon for a shipbuilder to build a staunch brig, load her with ton-timber, sail her to England and there dispose of vessel and cargo at profitable prices.

Nova Scotia's Palmy Days

The palmy days of Nova Scotian shipbuilding were undoubtedly in the latter half of the last century, but the earlier years were by no means unproductive. In 1826 "the ship Atlantic," a vessel of 330 tons, was launched at Dartmouth and was, probably, with one exception, the largest vessel built in the province up to that date. But larger ones soon followed, and the shipyards of Nova Scotia must have been fairly busy, for in addition to the vessels lost and sold, a parliamentary return in 1852 showed that the registered vessels of the province numbered 2,896, aggregating 176,300 tons, and employing more than 11,000 seamen.

The latter half of the nineteenth century witnessed a marvelous development of shipbuilding in Nova Scotia, but the years of greatest activity were between 1860 and 1890, while all the largest ships, with very few exceptions, were built in the seventies and eighties. The industry was not confined to any section of the province, but was practically universal. From cove and inlet was heard the sound of the shipwright's axe and the caulker's mallet. Labor was abundant, wages, although far below the present rate, were satisfactory, shipbuilders were becoming wealthy and the country was prosperous.

Yarmouth County was one of the first places to become interested in the game. In 1787 her first brig was launched—a vessel of 48 tons. Several small schooners and sloops had been built earlier in the history of the county; brigs of increasing tonnage followed and in 1814 the shipbuilding industry culminated in the launching of a ship-rigged vessel of 300 tons. At the beginning of 1879 the number of vessels on the Yarmouth registry books was 297, with an aggregate of 153,515 tons. According to the census of 1881 the population of Yarmouth County was 21,284. Unless the population was larger in 1879, which is not likely, the Yarmouth people then owned rather more than seven and one-quarter tons of shipping per head. Among the vessels built by or for Yarmouth owners after 1879 were the "County of Yarmouth," 2,154 tons; "Frederick B. Taylor," 1,798 tons; "Ellen A. Read, 1,750 tons; "Vendome," 1,150 tons; "Stalwart," 1,545 tons; and "Vanloo," 1,496 tons.

Yarmouth, however, had no monopoly of the shipbuilding industry. The adjoining counties of Shelburne and Digby turned off many fine vessels—some of them for Yarmouth owners. Annapolis, the birthplace of American shipbuilding, changed her allegiance, but retained her historical industry. King's County built ships at a dozen or more places and some of her shipyards were kept constantly busy for many years. C. R. Burgess, the largest shipbuilder and shipowner in the county, built and owned a famous fleet. He owned at one time five full-rigged ships, averaging nearly 2,000 tons each, besides a number of other vessels ranging from 530 to 1,800 tons. His largest ship, the "Canada," was launched at Kingsport in 1891 and was 2,127 tons register. After many years of successful service she was sold to J. B. King & Company, who converted her into a barge and employed her in carrying gypsum from Windsor to New York. Notwithstanding her twenty-six years afloat, she is still a strong, handsome vessel, and apparently is good for many more years of service.

In the palmy days of wooden shipbuilding Hants County ships were favorably known all around the world, and went wherever ships could go. Bennett Smith commenced building at Windsor in 1855 and continued the business until 1877. During that period he constructed many fine ships, a dozen or more of them ranging from 1,200 tons upward. After his death in 1886 his sons continued the business several years and added some large vessels to the fleet, but they finally gave it up, and sold the whole lot to foreigners at far from profitable prices. Shubael Dimock, who for years was foreman for Bennett Smith, finally started business for himself at Windsor and built several large ships. At Hantsport were the shipyards of E. Churchill & Sons and J. B. North & Son. From 1863 to 1887 the Churchills turned off a dozen or more vessels ranging from 824 to 1,855 tons, besides a fleet of smaller craft. From 1852 to 1894 the Norths built a fleet of fifty-three vessels consisting of ships, barks,

barkentines, brigantines and schooners. Their largest ship registered 1,602 tons, and they had several others nearly as large. Of late years the Hantsport yards that once were so busy have been silent and deserted, but now a new company has bought the Churchill yard and a schooner of about 350 tons register is in course of construction.

Windsor and Hantsport were far from being the only or even the largest shipbuilding localities in Hants County. The business flourished for many years at Maitland, South Maitland, Noel and Selma, while vessels in smaller numbers were turned off in other parts of the county. The industry reached its culmination at Maitland in 1874 when twenty-two large vessels were launched. These included the famous ship "W. D. Lawrence," of 2,459 tons register, the largest sailing ship ever built in Canada. There was a larger one at New York at that time, but she was built to be a steamer and does not fairly count as a sailing ship. The dimensions of the "W. D. Lawrence" were: length of keel, 244 feet; length on deck, 272 feet; breadth of beam, 48 feet; depth of hold, 29 feet; between decks 9 feet, making a depth of 47 feet below the upper deck. The height from the bottom of the keel to the rail was 55 feet. Her main lower mast, of Southern yellow pine, was 100 feet long and weighed 18 tons. The height of the mast from keelson to truck was 206 feet 8 inches. Her main yard was 90 feet long and the length of her main upper topsail yard was 72 feet, with a hoist of about 50 feet. Her spread of canvas was 8,000 yards. Her chains weighed 33 tons and her two largest anchors weighed three tons each. The W. D. Lawrence was successfully employed eight years by her builder and owner and was then sold to Norwegians. Mr. Lawrence, in answer to some unfavorable criticism, published a statement which showed that the big ships paid annual dividends of 22 per cent. on the original investment.

On the opposite shore of Cobequid Bay Colchester shipyards turned out many fine vessels. At Great Village the well-known firm of McLellan & Blaikie carried on a flourishing business for many years. At Masstown, Bass River, Economy and other villages along shore shipbuilding was the chief industry for more than half a century. The business gradually died out, and at present there are not many indications of its speedy revival.

Pictou was one of the first counties to enter the shipbuilding game. We are told that "a vessel was launched from the point above the Gut in the year 1788," and Murdock's History states that in October, 1798, Messrs. Lowdens launched "the ship Harriet, burden 600 tons." This statement is somewhat indefinite. Nowadays when we speak of a vessel of, say, 600 tons, it is generally understood to mean her registered tonnage. In the case of the "Harriet" it may mean her carrying capacity, which in many of the vessels built today nearly doubles their registered tonnage. However, the Harriet was no mean vessel, for we are told she was "pierced for 24 guns and supposed to be the largest and finest ship built in this province." She appears to have been something of a "bluffer" as well, for she carried only four real guns, while the remainder of her armament consisted of "quakers." A famous Pictou ship of the long ago—the "Orquell"—made a trip from Pictou to England which long held the record; another ship—the "County of Pictou"—sailed from Pictou harbor and was never heard from again. The "Royal William," the first vessel that ever crossed the Atlantic entirely under steam, made her first trans-Atlantic voyage from Pictou in 1833, but was not built in Pictou County. And finally, to Pictou belongs the honor of establishing the first steel shipbuilding plant in Nova Scotia—the shipyard of the Nova Scotia Steel and Coal Company at Trenton, which has turned off one steamer this season with a carrying capacity of 1,900 tons, and will soon launch a larger one.

Cumberland County has long been noted for its shipbuilding activities. Cumberland men were among the first to go into the business; they developed it greatly during the boom period; they never allowed it to die out entirely, even when it was very dead in other parts of the province, and they promptly participated in its earliest revival. All along the Parrsboro shore shipbuilding was for a time the leading industry. Vessels were built in practically every creek and cove which afforded facilities for building and launching. At Advocate arbor four or five schooners might be seen on the stocks at once within a stone's throw of each other, with one or two large vessels at West Advocate. The first vessel built at Spencer's Island was the brigantine Amazon, of 170 tons, which was launched in 1862 and was destined after a varied experience to take part in an unsolved mystery of the sea. At one time in her history she was driven ashore in a gale on the east coast of Cape Breton, where she remained all winter and was then sold. Her new owner repaired her, changed her name to Marie Celeste, and finally sold her to a Boston firm. In 1873 she sailed from New York for Lisbon and the number of souls on board was said to be fourteen. This included several passengers besides the Captain's wife and youngest child. In December, 1873, she was towed into Gibraltar by the British ship Dei Gratia, which had found her derelict in the vicinity of the Canary Islands. When found the sails were set and the boats were at the davits. There were no signs of any disturbance or confusion, and in the cabin was a sewing machine with an unfinished piece of work on it. The story of the Marie Celeste has been told all over the world and has given rise to countless theories and suppositions, but no reliable trace of the missing voyagers has ever been discovered. But the shipping fame of Spencer's Island rests on a broader basis than the mystery ship. The Amazon was succeeded by a splendid fleet of large vessels, mostly ships and barques, ending in 1891 with the ship Glovecap, of 1,721 tons, the biggest vessel ever built in the county. These were followed by a fleet of two schooners, one of which, the Coral Loaf, was sunk this year by a U-boat. At Port Greville the Elderking, Hatfields, Grahams, Pettiass, Bentleys, and later the Cochranes, turned out scores of fine vessels. In October, 1879, Captain J. E. Pettis launched the tern schooner J. S. Pettis, of 292 tons register, the first three-masted schooner ever built in Canada. At Parrsboro town many builders launched many vessels of various sizes, and probably, from first to last, no port in the province built more vessels. Many vessels were also built on Chignecto Bay and Cumberland Basin and on the shore of Northumberland Strait, but of these space will only permit this passing mention.

Ships are closely associated with sailors and, as a matter of fact, the finest ship is useless without a master and crew. The men of Nova Scotia took naturally to the sea, and even in the best days of wooden shipbuilding there was no lack of seamen. Many of the old-time shipbuilders were experienced ship-masters, and in drafting their vessels had at least the advantage of knowing what they wanted. Some of them built ships and sailed them; some of them, who had retired from the sea, built ships for others to sail. Among the "Captains courageous" who have sailed Cumberland ships to all the ports of the world were the Knowltons, Morrises, Blinkhorns, Spicers, Merriams, Hatfields, Bentleys, Salters, Howards, McLaughlan's, Durants, Ogilvies and many others. It would be useless to attempt a reference to even a part of the master mariners who have sailed from other parts of the province, for their name is legion. Fifty years ago a Yarmouth lady, a Mrs. Hatfield, had her parlor decorated with the portraits of her six sons, each of whom was master of a fine ship. This, of course, was an exceptional case, but there were many homes in Nova Scotia which sent out from two to four master mariners. These, as a rule, were brave, skilful men who navigated their ships to all the ports of the world, and their "Bluenose" crews were not excelled in skill and daring by any men who ever sailed salt water.

New Brunswick's Shipbuilding Industry

In New Brunswick shipbuilding made an early start and was for many years a leading industry. Ships were built in many parts of the province, but the business concentrated at St. John, and more vessels were turned off in that vicinity than from any other port in the Maritime Provinces. The first vessel built above the Falls of the St. John River, and one of the first of which there is any record, was built for Benedict Arnold, whose memory is not honored over the border. His St. John builder seems to have had reason for loving him, for on account of his being two or three days behind contract time in completing the vessel, Arnold refused to accept her unless a ruinous reduction was made in the contract price. This builder was great grandfather of Hon. J. D. Hazen, late Minister of Marine and Fisheries, and now Canada's representative at Washington. Other builders found it more profitable to build for themselves, or were more fortunate in their contracts, for some of them became owners of fine fleets and all of them made money. The success of the pioneers induced others to emulate them, and at one time St. John shipyards could be counted by the dozen, while some of them turned off two or three vessels a year for many years. Shipbuilding in New Brunswick was a prosperous and growing industry from 1770 to 1884.

Probably St. John's shipping prosperity reached high-water mark in 1876, the year before the great fire. In that year her register showed 805 ships, aggregating 283,073 tons, or an average over 350 tons to each vessel. St. John's prosperity and progress were based on shipbuilding and ship-owning, but she suffered one serious setback from a shipyard fire. In 1841 the Jane Duncan, a ship of 900 tons, was nearly ready for launching in the yard of Owens & Duncan, Portland. One day Mr. Owens found that the holes in the dead-eyes were too small to allow the lanyards to pass through for setting up the standing rigging, so he asked one or two of the men to remain during the noon hour and help him enlarge the holes by burning. Red hot bolts were brought from the blacksmith shop for this purpose, and in some way one dropped among the tarry chips and shavings under the ship. Fire started at once and soon got beyond control. The freshly tarred bottom of the ship and her painted sides were enveloped in a sheet of flames. The tide was out, and a small brig which had just delivered forty tons of lignum vitae on board the ship, was aground and was quickly ablaze. The fire spread to the adjoining buildings and burned over a large area. When the fire was got under it was found that the Wesleyan Chapel and fifty-three houses had been burnt or pulled

down and more than 1,100 people rendered homeless. The fire spread so rapidly and burned so fiercely that nothing could be saved from the houses. The Chapel was partially insured, but there was no insurance on the ship and practically none on the other property destroyed. The loss to Owens & Duncan was a serious one and is said to have amounted to over $60,000—a large sum in those days—but they built many fine ships afterward. Later the yard was acquired by David Lynch, who, in the course of forty years, sent out more than sixty vessels. Among them were the nine large ships and barks built for Howard D. Troop & Son, of St. John, and widely known as the "Troop Fleet." The other vessels built by him included ships, barks, barkentines, schooners, pilot boats, yachts, tugs and steamers. Some of his fleet had more than a local reputation for speed, especially the pilot boat David Lynch. Probably no other man in New Brunswick was so widely known as a skilful and reliable shipbuilder.

St. John's fastest ship was the Marco Polo. She was launched in 1851, and was chartered soon after by the British Government to carry passengers to Australia. Her first voyage under the charter broke all sailing records, for the trips out and back were each made in less than eighty days. During the rush to the Australian mining camps she was frequently unable to accommodate all who applied for passage. The largest ship ever built at St. John or in New Brunswick was the Morning Light. She was built at St. John in 1855 by W. & R. Wright, and registered 2,440 tons, only a few tons less than Nova Scotia's biggest ship. Many other fine ships were built at St. John, but the mere mention of their names, or even the names of their builders, would require too much space. The city of the Loyalists undoubtedly became the shipbuilding and ship-owning centre of the province, but fine fleets were built and owned at Dorchester, Sackville, Moncton, Hillsboro, Richibucto, Newcastle, Shediac and Chatham, while from dozens of other ports around the coast an occasional vessel was turned off. A considerable portion of the shipbuilding records of St. John is now traditional, for the registry books of the port from 1822 to the middle of 1877 were burned in the great fire which destroyed a great part of the city in the latter year.

Shipbuilding has been carried on to some extent on Prince Edward Island, but its development was small and slow in comparison with the other Maritime Provinces, and was devoted chiefly to the production of small schooners for coasting and fishing. Perhaps the largest vessel ever built on the Island was the bark Charles E. Lefurgey, of 936 tons register, which was launched at Summerside in 1884; and probably one-half of the vessels now owned by the Islanders were built elsewhere. One expects Island men to take to the water, but the inhabitants of the "Garden of the Gulf" appear to prefer agriculture.

The best known shipbuilder of his time was Donald McKay, of East Boston. The famous clipper ships built by him, such as the Great Republic, White Squall, Staffordshire, Flying Cloud, James Davies, and Glory of the Sea, were among the largest and fastest wooden vessels ever built and were known all over the world. McKay was born in Shelburne County.

Decline of the Wooden Shipbuilding Industry

The decline of the wooden shipbuilding industry is usually attributed to the development of steam navigation and the competition of big iron steamships. These undoubtedly were powerful factors in stopping the building of big wooden sailing ships, and in finally driving the "windjammer" from the seas, but the decline, as far as these provinces were concerned, commenced before a tramp steamer had even visited our ports. The shipowners themselves were unintentionally responsible for starting the decline. They naturally wished to keep their fleets in good condition, and when one of their ships was nearing the end of its class they prepared to get rid of it rather than have the trouble and expense of having it reclassed. Accordingly the old ship was sold for what it would bring, and a new one was built to replace it. Practically the only customers for second-hand ships were the Norwegians, and as they had the field to themselves, they were very close buyers. They also had the reputation of being able to sail their ships more cheaply than any other owners, and, as the amount of their investment was small, they could well afford to underbid the owners of better vessels. This was particularly the case in the lumber trade, for their vessels could carry lumber when they were scarcely fit for anything else. At one time a large proportion of the fleet carrying deals from provincial ports consisted of ships which had been sold to Norwegians by provincial owners. By selling their old vessels to Norwegians at ridiculously low prices the provincial owners contributed to the destruction of the shipbuilding industry, for they helped to establish a competition which could not be successfully met by new ships. Provincial ships still held their own in distant ports where first-class ships were required, and where the Norwegians did not venture to compete; but with the advent of the tramp steamer even "deep water" voyages became less profitable. The big iron and steel steamships would go to any port that had water enough to float them; while their great carrying capacity and speedy despatch, to say nothing of reduced freight rates, commended them to shippers everywhere. The final stroke was given by the insurance men, who refused to underwrite freight in wooden bottoms except at ruinous rates which the shippers were naturally reluctant to pay. Of course, all wooden ships were not driven from the seas at once, and they never became totally extinct, but owners generally got rid of them as soon as they could, and very few new ones were built. Even the Norsemen and Italians found the old wooden ships were no longer profitable and began to acquire steamers, but in doing so they adhered to their policy of buying old vessels.

In considering the revival of the wooden shipbuilding industry it is well to remember that in some parts of Nova Scotia the wood revival conveys an incorrect impression of the present situation. Lunenburg, famous still for the the fast privateer she sent out during the war of 1812-14, has been building vessels ever since, and the fishing schooners she turns off every year are unsurpassed in strength, speed and beauty. Larger schooners for the West Indies trade have also been built as required, and the demand for them has never slackened, but is steadily increasing. In Shelburne some shipyards have never been idle. Joseph McGill, one of the builders, has turned off a fleet which has acquired much more than local fame. During the past ten years he has built the hulls for nearly two-score steamers of various styles and sizes for the New Burrill-Johnson Iron Company, of Yarmouth. Digby in recent years has built quite a large fleet of fishing and coasting schooners, with a larger one occasionally for off-shore trading. This statement, with slight modifications, is true of several other counties, but it is none the less true that in many of the shipbuilding centres of former years the industry was practically dead, or at least in a comatose condition. Cochrane's shipyard turned out at least one large schooner every year, but there were times when every other shipyard in Cumberland was idle. In Kings, Hants and Colchester Counties, formerly shipbuilding centres, the industry ceased to exist.

Then came the Revival. Four or five years ago a few men in various parts of the country had vision enough to see that vessels larger than was needed for coasting would be required. When the war came and the Government began to commandeer merchant steamers, it was soon found that there was not enough square-rigged vessels left to supply the demand. Then the men who had wisely built big schooners decided to employ them in carrying deals overseas, although the wiseacres protested that schooners were unfit to be ocean carriers. But in spite of all predictions the trial voyages proved successful, and then it was that the revival actually began. Even then its growth was slow, for some builders thought the war would soon be over, while others had been out of business so long that making a fresh start was very like a first beginning. But the growth was sure, and the larger it became the faster it expanded. More vessels were built last year than were turned off the year before; the vessels built this year will probably outnumber the output of the two preceding years, while next year's activities will doubtless exceed anything that has been seen in the last thirty years or more.

The revival in New Brunswick began later than it did in Nova Scotia, but its growth in some parts has been more rapid. One St. John firm has contracted with the Imperial Munitions Board to build two steamers with a carrying capacity of 3,000 tons each. Other leading firms are engaging extensively in shipbuilding, and all around the coast are indications of a return to the industry which once made the province famous. Of course, it is impossible at this writing to tell just how far the movement will spread, but it will not be surprising if next year witnesses a shipbuilding renaissance that will equal the busiest days of the old-time industry.

Mark Twain, in concluding an account of his visit to Rome, boasted that he was the only man who had ever written on the subject without quoting "Butcher'd to make a Roman holiday." In like manner I may claim to be the only one who ever wrote about ships and shipbuilding without saying something about "Sailing the Seven Seas." One writer allowed the Seven Seas to break in three times in an article that would cover about half a page of this magazine. Now I am not quite sure which the seven seas are, nor where they may be found, and some of the other writers might be equally puzzled, but the phrase is aptly allitrate and softly sibilant, and it requires considerable self-restraint to keep from using it when writing of those that go down to the sea in ships.

At the conclusion of the investigation into the newsprint price situation, Commissioner Pringle, on October 29th stated that the government might very well assume control of the newsprint paper industry for the duration of the war in order that the publishers may be assured of a steady and adequate supply of paper.

The death of Mr. John Archie Bulmer, of Montreal, one of the oldest lumbermen in the city, is announced. He retired several years ago from the lumber business.

Quebec Shipbuilding—Past and Present

An Account of the Industry's Early Days, Its Rise and Decline and an Outline of Its Present Revival

By George Gale, Author of "Quebec Twixt Old and New"

DOUBTLESS there is no subject of such paramount importance to-day throughout the Dominion of Canada as that of building ships, both of wood and steel, in order to relieve in a large measure the alarming state of affairs that prevails at present, due to the scarcity of British and neutral tonnage. It is, in a word, a mighty effort on the part of the man power of Canada, of the North American continent, in fact, to offset the German submarine menace by assisting in the building of vessels, and thus aid in conveying the immense cargoes of freight offering in food and munitions to the civil and military population of the British Isles, France and their allies in Europe, who are engaged in the unparalleled life and death struggle in the cause of liberty and humanity against our enemies on land and sea as well as in the air. As a consequence, many ancient and abandoned shipyards from the Atlantic to the Pacific, where the whirr of the saw, the blow of the maul, and the ring of the mallet from the busy workers, once familiar sounds, have not been heard for a decade, are to-day the scenes of the greatest activity. The hearts of the few remaining veteran ship carpenters, caulkers, etc. (one may speak with authority for this district, at least), who loved their old callings and were very proud of their work years ago in the shipyards, are again made happy as a result. Many of these workmen, although long past the age for further practical activity, are delighted to know that the art of shipbuilding has revived and that wooden vessels, once the pride of the ocean, that had to all intents and purposes almost entirely vanished from the seven seas, have again been placed in commission as freight carriers, and, as in former days, are once more bowling across the briny deep loaded to their utmost capacity.

Abandoned hulks, moored to rotting wharves, and committed to rust and decay long before the war, have been repaired and fitted out to carry freight, while sailing vessels which were converted into coal hulks have been overhauled, re-rigged with tall spars and sent to sea once more. The majority of the ships are sailing under the schooner rig with three or more masts. Although not so speedy, vessels thus rigged are found to be able to ride the waves satisfactorily and are much cheaper to handle as to crew and other details than the square rigged ship with its immense spread of canvas of royals, sky sails, studding sails and stay sails. Quebecers have always been very much interested in the wooden ship industry, which, at one time, directly and indirectly, gave the majority of our population the means of a livelihood and was in the early days responsible for such popular suburbs as St. Roch's, St. Sauveur, Stadacona, Hedleyville (now Limoilou), Cap Blanc, etc. It was a question of living near the water front, within easy access of almost the only labor that was then offering. In fact, shipbuilding at one time was what the shoe factories are, or rather, ought to be to-day. Almost from the dawn of the past century, for a period of over sixty years at least, when the depression was first noticed, it was the most important industry in Quebec, providing employment for thousands of persons and at a time when work was most required, during the fall and winter months. Not only the ordinary carpenters, but the ship smiths, sail, rope and spar makers, riggers, shantymen, framers, ship chandlers, mill owners, as well as lumber and general merchants, in fact, all classes of the community shared in its prosperity. It has been truly said that at one time in Quebec more than half the men were engaged in shipbuilding, and nearly all the rest in doing business with them. Consequently, when the trade finally fell away, owing to low freight rates, dear money and the advantage of steam over sail, a period of suffering for our laboring classes followed. Even the shipbuilders themselves were not exempt from the hard times, and while many found themselves on the verge of bankruptcy the majority of the others were poorer by far than when they went into the business. It might not be amiss to mention here that whether with the axe or saw the French Canadian workman was an expert at the calling and formed the bulk of the skilled labor to be found in a shipyard. He had a reputation from the earliest years for his splendid workmanship. Later hundreds, if not thousands, of these men deserted the ancient Capital and made their way to the shipyards on the shores of the Great Lakes, at Owen Sound, Collingwood, Chicago, Detroit, Toledo, Cleveland, Buffalo, Oswego, etc., where work at their trade continued brisk and wages high.

Activities of Early Days

During the years that the trade boomed, however, there were scenes of great activity, especially from November to May, in the half hundred or more yards on both sides of the St. Charles River, as far as Stadacona—where Jacques Cartier wintered his three small ships on his second voyage to Canada in 1536—in one direction, and in the other at Gingras, behind the historic pile known as the General Hospital, in which, for almost 225 years, the aged poor have found a refuge, and where the wounded French and English soldiers in 1759 and those of Arnold's army in 1775 were tenderly succored by the devoted nuns. John Munn's yard was located at the foot of Grant Street. The small park, presently bounded by St. Roch, St. Joseph, Desfosses and St. Paul Streets, even in the recollection of some of our older inhabitants, was used as a shipyard. The present St. Ann railway depot occupies the site of a yard formerly the property of Messrs. Nicholson and Russell. Many others were located at Cap Blanc, Wolf's Cove, Sillery, Cap Rouge, Pointe aux Trembles, Levis, Lauzon, Island of Orleans, etc. As a result scores of vessels, in the early days as small as one hundred tons, but latterly some of two thousand tons burthen, of magnificent design, were fitted out for sea in the various yards. During one of the winters of the Crimean war period, in the fifties of the past century, eighty-two ships, barks and

Hall's Saw Mills at Montmorency Falls, near Quebec, many years ago. These mills were once reputed to be the largest in the world.

brigs were built in the yards on the banks of the River St. Charles and left their ways gracefully to the delight and amidst the cheers of thousands of Quebec's population. In 1864-65 one hundred and thirteen vessels of all sizes were constructed in the various shipyards, while in the following winter there was the usual sight of five ships on the stocks at the same time in the Dinning yards at Cap Blanc, namely, the Friga, Mora, Grace Redpath, Helen Drummond, and the Richard. In Allan Gilmour & Company's extensive yards at Wolfe's Cove, where some of the most expert tradesmen in the shipbuilding industry were employed—but now, alas, have nearly all passed away—four vessels on the stocks, in close proximity to one another, were often to be seen. The handsome clipper ships from Quebec, loaded with square timber, deals, staves and lathwood, made many a record passage to England and the continent in the olden days, and were the pride, not only of the Atlantic, but of the Quebec men who assisted in their designing and construction. Many million feet of pine deals, carried in some of these vessels every season, were cut at the Hall sawmills at Montmorency Falls, said to be the largest mills in the world at that time. They were on the site now occupied by the textile factory. There were no less than six mills side by side and two known as "tidal" mills in operation, with six miles of dockage, where hundreds of workmen found employment. Two of our prominent fellow citizens, Mr. J. G. Scott, formerly general manager of the Quebec and Lake St. John Railway, and now president of the Board of Trade, as well as Mr. D. H. Pennington, lumber merchant and Harbor Commissioner, started their business careers with the Hall concern. Other mill owners at the time were William Price, the father of the industry in the Saguenay district, whose mill was located on the Levis side of the river, even in the early days of the past century, as well as Bennett & Company, Hamilton Bros., and Ritchie & Cull, in addition to the Jones mill at Hedleyville.

Quebec's Celebrated Clippers

The best known Quebec built clippers were the Illustrious, Trenton, Tea Taster, Boomerang, Lady Dufferin, Shooting Star, Hilda, Brunelle, White Rose, Minnehaha, Rosemeath, Chillian Wallah, Volage, etc., some of which proved marvels for speed and endurance on the high seas for years. The Shooting Star, built in Lee's yard at Hare Point, of one thousand four hundred tons burthen, made the passage while on her maiden voyage from Quebec to Liverpool, with a cargo of deals in fourteen days. The beautiful clipper Brunelle, called after her builder, logged over fourteen knots an hour and left many swift sailers and even steamers far astern, while the Rosemeath, with a full cargo, made the passage from Quebec to Glasgow in fourteen days. Other instances of fast Quebec sailers might be mentioned as well as wonderful sea races recorded if space permitted. The best known day's run for a clipper ship—the Flying Cloud—not a Quebec built vessel by the way, was four hundred and thirty-three and a quarter statute miles from noon to noon, a record of travelling over the waters of the Pacific that could hardly be surpassed by the modern greyhounds propelled by steam to-day. To see a ship with her studding sails set alow and aloft was considered by our forefathers one of the seven wonders of the world.

The Island of Orleans, a few miles below Quebec, was quite a centre for shipbuilding at one time, but not for many years past. Fine square rigged vessels, the envy of their captains and crews, were launched from yards at L'Anse du Fort, near the ferry landing at Bont de l'Isle—where the Huron Indians sought in vain a refuge from their murderous enemies, the Iroquois, in the middle of the seventeenth century—and at St. Patrick's Hole, located within a mile this side of St. Laurent. It was during the years 1823-24 and 1824-25 that two vessels, the Columbus, of 3,690 tons, and the Baron of Renfrew, of 5,294 tons, both built by Charles Wood, were launched from the yard at L'Anse du Fort. They were the largest wooden vessels ever built in this city or district, or, for that matter, anywhere else, and were constructed solely for the conveyance of square timber to the English market. The Baron of Renfrew was 303 feet in length, with a beam of sixty feet, a hold of thirty-five feet and five decks of seven feet each. There was considerable difficulty experienced in launching the vessels and both were wrecked before returning to Quebec, entailing a loss of over five million dollars on the owners, who were English capitalists.

The Industry Reviewed

The shipbuilding industry has, however, once more been revived at the Island of Orleans after a lapse of many years. Some time since a party of patriotic business men, all but one of them strangers to Quebec, however, determined to try the experiment of building ships in this locality, and thus, in a small measure at least, perform their "bit" in responding to the appeal of the Premier of Great Britain for ships, and still more ships, besides bringing Quebec into line with the other old shipbuilding centres of the Dominion. The gentlemen in question, who deserve the thanks of our population and to receive every encouragement for their spirit of enterprise, are Messrs. James Playfair, of Midland, Ont., J. A. (Major) Gillies, of Braeside, Ont., R. A. Carter and G. A. Wood, of Montreal, and last but not least, our own fellow townsman, Mr. Martin P. Connolly. The company, which is known as the Quebec Shipbuilding and Repair Co., leased for a term of years a portion of the spacious property known as the Maritime Shipyard, situated at a convenient distance from the ferry landing at St. Laurent, where there is a fully equipped modern shipyard and repair plant, including a sawmill and other machinery to expedite the work. Mr. D. McLaughlin, a veteran though still active shipbuilder from St. John, N.B., who constructed many a wooden flyer in the olden days in the Maritime Provinces, and takes pride in his calling, is in charge of the work, and has, as assistants, several trained men from his own province. The bulk of the work, however, is being performed by the inhabitants of the Island, who, although novices for the most part, are very apt pupils, judging from the manner in which they wield the broad axe already, and go about their work as though to the manner born. The vessels are schooner rigged, of the two deck type, with four masts and auxiliary power, and a dead weight capacity of 2,100 tons. Their length over all is 223 feet, beam 42 feet and depth of hold 20 feet, while they are being built in accordance with the requirements of Lloyd's register of shipping and classed A1 for fifteen years. The wood used in the construction of the vessels is all Canadian, and includes oak, rock elm, birch, black spruce and Douglas fir from British Columbia, the latter for the masts.

The work on one of the vessels, christened the "M. P. Connolly," and called after one of the energetic directors of the company—the ceremony being performed by Mrs. Connolly—was sufficiently advanced to be successfully launched the latter part of October in the presence of a large number of spectators. The ship is now moored in the inner basin at Quebec, where the masts and rigging are being placed in position and the vessel otherwise made ready for sea before the close of navigation. This is the first wooden craft of any size built by private capital or otherwise in the province for some twenty-five years, and Quebecers are consequently very proud of the fact.

In addition to their yard at the Island of Orleans the Quebec Shipbuilding and Repair Company has secured a strip of land on the River St. Charles side of the Louise Embankment from the Quebec Harbor Commissioners and are presently engaged in converting the place into a suitable shipyard. Here they intend starting at once, with a large staff of workmen, on two wooden freighters of some 2,500 tons each, this time for the Imperial Munitions Board.

On the north side of the St. Charles River, opposite the city, Messrs. Quinlan & Robertson, who for some years past have been employed in dredging and making other extensive improvements in the St. Charles River for the Federal Government, but were obliged to suspend operations until after the war, have devoted a portion of their extensive plant to the building of ships. They have a contract with the Imperial Munitions Board for the construction of four large wooden steam freighters of the standard size. A large number of men are at present employed in their yards and the two vessels on the stocks are already well advanced. It is expected that at least three of the four ships will be ready for launching at the opening of navigation next spring.

Two other freighters of a similar type are being built at Three Rivers by the Three Rivers Shipbuilding Company, while Messrs. Fraser, Brace & Company, of Montreal, who have a contract for four, are busily engaged on the work in their yards bordering on the Lachine Canal.

There are rumors that other firms, both in Quebec and outside districts, will shortly start building vessels of a somewhat lesser tonnage also for the Imperial Munitions Board.

Industry in Need of Government Encouragement

What is urgently required to stimulate the wooden shipbuilding industry still further and thus add largely to the tonnage that is of so much value and importance at the present time, as well as for years to come, is some action on the part of the Ottawa authorities in the way of the payment of bonuses. The Government should encourage the construction of small wooden freighters, cargo carrying vessels of, say, 200 tons and more with the most liberal bounty. Then the industry would not be confined to the larger centres solely, as at present. With some advantage offering mill owners of say Chicoutimi, Rimouski, Matane and other outlying river ports could co-operate with farmers and in a few months build quite a fleet of the smaller class of vessels, for which there is an abundant supply of timber almost at their very doors. These vessels could carry thousands of tons of fish, if nothing else, from Newfoundland to some parts of Canada all the year round, and to Quebec and Montreal during the season of navigation at least. This would be of immense benefit to the people of the Dominion and a great factor in solving the problem of the present excessive cost of living. It would also, no doubt, in a large

measure, assist in hastening the day when the German submarine peril would be overcome.

The late Narcisse Rosa, a former well-known French Canadian shipbuilder, who constructed many a splendid vessel in his day, in Quebec, gave the number of vessels built in this port from 1797 to 1896 as 2,542, of 1,377,099 tons, and valued at $55,119,600. But shipbuilding had its origin in New France as early as 1666, when Intendant Talon had a vessel of one hundred and twenty tons constructed on the banks of the St. Charles River, while many keels were laid in succeeding years. Patrick Beaton built a full rigged ship, christened the Neptune, of 363 tons and measuring 117 feet in length, in 1797, and it is the first one recorded since the conquest. The last wooden vessel built in this district was the barkentine White Wings, of 430 tons, constructed by William Charland and launched from his yard at Lauzon in 1893. As late as 1887, however, the Titanic, a ship of 1,405 tons, was built by George T. Davie, at Levis. It was as early as 1839 that John Munn, the most prominent shipbuilder in Quebec at one time, launched the largest vessel hitherto built here, a ship of 1,267 tons, named the United Kingdom. The Quebec, Rowland Hill and John Munn, the latter four hundred feet in length, three well-known passenger steamers of the early period of the past century, that plied between this port and Montreal, were also built by Mr. Munn.

Among the leading men in the shipbuilding trade in the port of Quebec from the early forties of the past century down to the construction of the last vessel in 1893, were the following:—Messrs. J. Campbell, J. Ross, W. Patton, G. Pemberton, H. Lemesurier, E. Oliver, W. Lampson, H. Gowen, Nicholson and Russell, J. Bell, H. Sharples, J. Dunn, W. Power, J. Leaycraft, T. Kelly, T. Oliver, J. Wilson, E. Burstall, H. Burstall, G. H. Parke, John Munn, J. Jeffery, James Oliver, A. Gilmour, J. Tibbitt, G. Black, W. Cotnam, J. Nesbitt, P. Valin, W. Russell, M. I. Wilson, J. Perrie, R. Jeffery, H. N. Jones, E. Sewell, J. Lemelin, W. Price, C. Sharples, J. Goudie, J. Gilmour, W. Stevenson, D. Burnett, N. Rosa, T. Lee, W. Baldwin, I. I. Samson, E. Trehan, Peterson and Shaw, H. Dubord, T. Oliver, J. E. Gingras, G. Lemelin, G. Usborne, J. Sharples, P. Brunelle, H. Dinning, J. Lane, McKay and Warren, G. T. Davie, W. Ray, R. McCord and Son, Dunn and Samson, P. Maxwell, J. G. Ross, Lachance and Flanagan, C. Wilson, W. Charland and F. X. Marquis.

Reminiscences of Early Days

Shipbuilding had its origin in New France as far back as 1666, when Intendant Talon had a vessel of one hundred and twenty tons built in Quebec, and with the view to establishing shipbuilding as a regular industry in this country, issued orders to the Seigneurs to reserve all the oak growing on their domains for that purpose. Several vessels were built in 1671, while in 1687 one was built by the local merchants. In 1672 Talon built a record vessel of four hundred tons. These vessels were wholly for commercial purposes. After Talon's departure the industry fell away and no shipbuilding was carried on save in a very small way and to meet purely local wants until 1732, when Intendant Hocquart took up the question, established a shipbuilding yard of four or five acres on the River St. Charles, with a dry dock on the opposite shore, and ten merchant ships were constructed there that year and eleven the next, with a stimulus of a bonus from the King of France, graduated according to tonnage for vessels of sixty to two hundred tons. These seem to have been the largest vessels of any kind with one exception built until 1739, when orders were received from the French King to try the experiment of building war vessels. Accordingly, the construction of a corvette of five hundred tons was begun with an engineer named Neree Levasseur acting as contractor or builder for the King. On the 4th of June, 1742, the first transport for the French navy, the Canada, was launched here, amidst great rejoicing, and was sent to Rochefort, France, with a crew of eighty St. Malo men. She was loaded for the voyage with boards, iron and oil. In the spring of 1744 the Caribou, of seven hundred tons, carrying twenty-two guns and a crew of one hundred and four men, left the yard on the St. Charles and sailed for France in July, followed in 1745 by the "Castor," of twenty-six guns and two hundred men. This was the first warship built for the protection of Canada's trade and to guard the Gulf of St. Lawrence. The "Martre," launched in 1747, was the last war vessel to be built on the banks of the St. Charles River, as it was found that the water there was not deep enough, even at the highest tides, for the increasing tonnage of war vessels. After the purchase of several building lots and preparing the ground for shipbuilding, a yard was opened at the Cul de Sac, at the site of the old Champlain market, where the Transcontinental Railway offices now stand in the Lower Town, and the first vessel built there was the "St. Laurent," of sixty guns, in 1748. In 1750 the "L'Original," of seventy guns, followed, but she broke her back on leaving the slip. Timbers from this ship were picked up from the river bottom some years ago. "L'Original" was in turn followed by the "Algonquin" in 1753 and the "Abenaquis" in 1756, the last two being small, lightly armed corvettes. The frigate "Le Quebec" was launched in 1757. After this the construction of the bigger war vessels was given up here, the French naval authorities having found that the "Caribou" and the "St. Laurent" did not come up to their expectations, owing to the inferior quality of the wood used in their construction. But mercantile vessels of relatively small tonnage compared with those in our own days continued to be built here down to the conquest. The wood used in the construction of sailing and war vessels in the early days was white and red oak, elm, birch and spruce. The masts were brought from Bay St. Paul, some miles below Quebec, and the Lake Champlain district. The majority of the vessels, especially the war craft, were manned by crews brought out from France, while the foremen carpenters, riggers, block makers, etc., were also sent out by the French Government in order to instruct the Canadians in the work. The iron work for the ships was cast at the St. Maurice forges, located some seven miles from Three Rivers, Que., which were opened in 1732. The forges were worked for some years by the French Government and guns as well as projectiles were cast there. After the conquest the English military authorities took possession of the forges, but in 1767 leased them to a local company for a term of sixteen years. In 1783 Hon. Conrad Gugy was the lessee and he was followed in turn by Messrs. Munro & Bell, Matthew Bell and others. The forges have not been in operation for a number of years. The old style box stoves, household utensils, as well as the farm implements used by the early settlers, were also cast there down to an early period of the past century.

Future of Shipbuilding in B. C.

By John Eadie, Manager Dingwall Cotts & Co., Vancouver

IT is not easy, in reply to a request for one's opinion on the prospects for shipbuilding as a permanent industry in British Columbia, to write anything that can in any way be considered authoritative or reliable, mainly because the conditions which will obtain in the future are so entirely unknown. Nothing can be more gratifying to the people of Western Canada than the way in which the resources of the Pacific Province have been mobilized to build both steel and wooden ships for the Empire's needs. It can only be hoped that the same adaptability and readiness to use available resources will be available to deal with conditions arising after the war, and that the very considerable obstacles in the way of establishing a permanent industry may be overcome, but it would be foolish not to recognize that obstacles do exist.

As regards steel steamers, the distance from the sources of supply of steel will always militate against British Columbia, when there is any kind of competition in the world's markets, even assuming that the high labor costs can be overcome by the reduction of the cost of living and a consequent reduction of wages. If there were any immediate prospect of steel being rolled in British Columbia this position would be entirely different and British Columbia might readily become a large shipbuilding centre, but this must necessarily be a long way off, and meantime freight rates on steel and other material from eastern points must remain a handicap against British Columbia.

When we consider wooden shipbuilding the position as regards material is reversed, as probably the most suitable shipbuilding timber now available is obtained right on the coast. It is, however, problematical whether the wooden vessel, either steamer or sailing ship, will be economical in cost of construction and in operation, as compared with the steel steamer, after the war. In normal times the cost of wooden construction has been higher than that of steel, and the same comparison may be anticipated in the future. On the other hand, the demands on the world's output of steel will be tremendous for many years after the war, and it may well be that, with the increased experience and facility gained by British Columbia yards in carrying out the present wooden ship programme of the Imperial Munitions Board, the costs of building wooden vessels may be lower than steel for longer than is sometimes anticipated. In this case, and if the type of wooden steamer at present being built be found strong and suitable in every way for the carriage of dry and perishable cargoes, there is a future for the building of these vessels for the carriage of Pacific Coast products to their various markets, as this will be the last market in the world to feel the effect of a reduction in freight rates, and we shall be thrown on our own resources to arrange for the transportation of our own goods. With the development of the lumber export trade, too, there will probably always be a demand for small wooden schooners, possibly with auxiliary engines, for the transportation of lumber, these vessels being owned either by the mills or by lumber exporters. The

lumber trade, after the lesson of the past three years, are not likely in future to take the chance of the open tonnage market, and to see their entire transportation facilities withdrawn whenever there is a world shortage of tonnage.

Everything depends on the energy and enterprise of our business interests and of the people in general, not only on the coast but in the interior, to take advantage of our natural resources and facilities and personal skill, and to organize and develop them to the utmost degree of efficiency to ensure access to markets for Canadian products. This will probably mean a much more extensive interest in shipbuilding and shipowning by our people of the coast, and even of the prairies, than has hitherto been the case, as the prairie interests are as much involved as those of the coast towns in seeing an efficient shipping trade built up from our ports.

The Importance of Canadian Shipbuilding

Wooden Vessel Construction the Most Important Business for Canada To-day

Transportation of Supplies Must Be Rendered Certain

Written specially for the Canada Lumberman by Edward Harper Wade, Quebec, P. Q.

Edward Harper Wade

THERE is a prevalent belief and widespread feeling throughout the Dominion that sending men to the front is of such paramount importance that all other considerations shrink into comparative insignificance, and that, failing an adequate supply of volunteers to make up half a million effectives so sent, conscription and winning the war are practically synonyms, or equivalent expressions. Many are even quite honestly somewhat hysterical respecting what seems to them the one necessity, and talk about the abandonment of our boys in the trenches, or the refusal of adequate support to our overseas troops, as though anything of the kind were possible or contemplated under any circumstances by any party. The present is certainly a time for prompt action, but no less for careful consideration. It must be remembered that those who pump water and lay and protect the hose are just as necessary in extinguishing a fire as those who actually fight it.

Canada is called upon to assist in winning the war in four different ways, not one only—in men, in munitions, in food, and in ships—and their relative importance may at this present time be in the reverse of the order in which they are named. It is for those that the Canadian electorate entrusts with the government of the country to apportion to each individual his or her task, as the services of each may be most effectively applied to advance the end in view—the one end that all good Canadians, without distinction of party, race, or province, know well must be accomplished—the final and decisive defeat of the Germans and the utter destruction of their military power.

Our boys at the front must be provided with abundant munitions and supplied liberally with the necessary food and clothing. To enable this to be done it must be possible to send forward from Canada all they require, and this cannot be done without vessels. Provision must be made for bringing back those who are incapacitated for further services, not only in fulfilment of our duty to our best and bravest, but to relieve the United Kingdom from an unnecessary burden at a time when her food resources are strained to the utmost.

Harry Lauder, who has given in the cause of right and justice his only son, dearer to him than anything else in the world, has recently been appealed to by the government to use his influence in inducing consumers to limit the household use of bread to the absolutely necessary. In response to this appeal he has told the people how serious the present position is; that they may yet know what it is to find available food supplies inadequate for the requirements of the population; that they may yet have to face not only shortage but starvation and that it is quite possible our brave boys may have to go over the top hungry when attacking the Germans. He told them he spoke the truth as he knew it, and as a simple man of the people, speaking in all honesty to his fellow-countrymen.

Transportation the Key to Security

It is becoming increasingly clear that the wheat harvests of the world are not adequate for even the present restricted consumption apart from the problem of transportation, and for a considerable proportion of the earth's population absolute famine is within measurable distance.

However great the supply of munitions and the production of foodstuffs on this side of the Atlantic may be, it is certain that unless both can be delivered in Europe they are useless for winning-the-war purposes. As war preparations progress and develop in the United States, a great army of trained men will materialize, but it is in France and Flanders they are required—not North America. Already they are going forward in considerable numbers, but again the problem of transportation presents itself. It must not be forgotten that every man sent over must be fed from this side, and every body of men kept adequately supplied with munitions from the same source. It has been stated that each soldier sent will entail the sending of his weight in munitions and supplies every thirty days if he is to be efficiently provided for, so that for long to come there will be an immense fleet required in that connection alone—a fleet that is now under construction in the United States, but that will largely be required for that special purpose, so will not relieve to any marked extent the present existing shortage of tonnage for other requirements.

The position under the submarine menace now shows signs of improvement, but is still very uncertain. Against a loss of about four and a half million tons in the past eight months, new construction, completed and launched, is less than a million tons in the same time. It is only by reducing the losses and increasing the output that the Allies can hope to bring to naught the German hope of starving out the United Kingdom and other European opponents, and so rendering ineffective the armies opposed to them on the various battle-fronts. The possibility of reducing the losses is involved in uncertainty and governed by conditions not yet under control, for though the position is decidedly more promising it is by no means assured. Increasing the output is within the power of every shipbuilding country, under efficient government control and management assisting and directing private business enterprise.

The supply of fighting men seems assured by the entrance of the United States into the war; the sustained production of munitions seems amply provided for, but the supply of food, and especially the means of transportation of men, food, and munitions across the Atlantic, and of wheat, wool, and other necessaries from Australia, New Zealand, India, Argentina, and other places from which the voyage is long, is now the most important problem. How far it now exceeds the very momentous one of supply of fighting men is shown by the warning that Sir Joseph Maclay, controller of shipping of Great Britain, had addressed to the United States, that they must not keep on

Interior of wooden vessel during construction, showing rough temporary timbers. Quebec Shipbuilding & Repair Company, Isle of Orleans, P.Q.

sending men to the front unless they can provide corresponding shipping. Ships, not men, seem to be the great need of the Allies, according to Sir Joseph Maclay, who is the official spokesman on the subject for Great Britain. There are already, according to Sir Joseph—and his words have been most forcibly supported and confirmed by Lord Northcliffe, who represents the United Kingdom on this side of the Atlantic—more men in training in North America than can be made use of in France until the world's shipping has been tremendously augmented.

Steel Ship Construction Only Possible on Small Scale

Canada, unfortunately, is able to do but comparatively little in constructing steel steamers at the present time, for although possessed of great coal deposits in Nova Scotia, almost at tide water, within easy distance by sea from practically unlimited supplies of iron ore in Newfoundland, also at tidewater, such development as has taken place is utterly inadequate to meet the present demand for ordinary purposes, for even now the rails are being taken up on some of our Canadian railways to meet urgent war requirements in France, which would not be the case if our manufacturers could supply them. Canadian manufactured structural steel for shipbuilding purposes is not to be had in any adequate quantity, and steel plates for steamer construction are practically unobtainable. Canada is now paying the penalty of neglect of her unequalled resources for the production of iron and steel, resources that, properly and fully developed and utilized, would have made her a great shipbuilding country—a leading producer of steel steamers as she formerly was of wooden sailing ships. A carefully devised and wisely regulated system of bonusing, safeguarded by the reclamation and refund of the bonus on exported products might have done much. Government assistance in obtaining the necessary large capital to enable private or company development might have done more. The iron and steel industry of Canada, assisted and fostered by bonuses on production for a time, made steady progress till the end of 1913, when the record figures of 1,128,000 tons of pig iron and 1,168,000 tons of steel ingots and castings were produced, but in 1914 these figures fell to 738,000 tons and 828,000 tons respectively. Two Canadian companies, in their Newfoundland holdings, own possibly the finest deposit of hematite iron ore in the world. One hundred and forty-four thousand tons of this were shipped to Germany and Holland in 1912-13. There is no reason why there should not have been an abundant supply of steel instead of the present shortage. It is of little use to look to the United States for a supply of shipbuilding steel, as there is no available surplus in that country, and the export is restricted by government licenses and permits.

Wooden Ships—Canada's Opportunity

It is therefore evident that mainly by the building of wooden ships can Canada do her part in meeting the submarine menace and most effectively assist in winning the war. On the Pacific Coast, where material is readily obtainable, considerable progress has been made. In the Maritime Provinces good work is being done. In the shipyards of Quebec the sound of the adze and mallet is again heard, and building is progressing; but the present total is deplorably short of what might reasonably have been expected, or at least hoped for. The impossibility of obtaining adequate supplies of suitable timber is one difficulty; organizing and reviving in a somewhat altered form an industry that had seemingly passed away for ever is another. Still, all things considered, a fair commencement has been made.

It is certain that for long after the end of the war freights will remain at a high level, and there will be ample employment for a far larger fleet than in all probability will be in existence when peace is declared.

Let no one suppose that those engaged in the building of vessels, the production of wheat and other necessaries of life, or the manufacture of munitions and war material, are not doing as good work, and as necessary towards winning the war, as those who volunteer or are conscripted for active service at the front, though we can never have for them the same feeling as towards those who have faced death on our behalf. Conscription for shipbuilding or wheat growing may eventually be found as requisite, or even more necessary, than conscription for active service. Lord Northcliffe states that between the Dominions and the Homeland, Great Britain has approximately seven and a half million people in and about the war. To this must shortly be added continually increasing American contingents. Then there are the armies of the Allied nations. All these are more or less dependent on food and supplies from abroad, as are the civil populations of the various European countries. Providing and delivering the necessaries of life and means of warfare to meet European wants may be more important than the addition of another hundred thousand to the millions now driving back the Germans, but that is for all Canada to consider. Considerations, opinions, and feelings must be made subservient to winning the war.

In any case, it is clear that wooden shipbuilding is at the moment by far the most important business in which Canada is engaged or can engage. Each vessel constructed and launched is a valuable contribution towards accomplishing the desire of every Canadian heart, which is, without distinction of race or party, the final and decisive defeat of the Germans and the utter destruction of their military power as the necessary preliminary to that perfect and lasting peace which will follow winning the war.

The steamer Keith Cann, launched recently at Shelburne, N.S., is the largest steamer yet built in Shelburne and the first vessel to be constructed by the Shelburne Shipbuilders, Ltd. The steamer is owned by H. D. Cann & Son, the veteran steamboat owners.

Wooden Shipbuilding in New Brunswick

Its Splendid Past and Its Modest Present — New Activities Indicate Possibility of Important Growth in Near Future.

Written specially for the Canada Lumberman by R. E. Armstrong, Sec. St. John Board of Trade

TIME was when wooden shipbuilding was as the breath of life to New Brunswick. With an almost unlimited demand for wooden ships, with suitable timber everywhere and workmen a-plenty, shipyards sprang up in scores of places throughout the province. Wherever one went the sound of the workman's adze and maul assailed the ear, and wherever it was possible for ship to sail, there the "wooden walls" of New Brunswick might be found.

The list of wooden shipbuilders who operated at St. John was a long one, including such names as Jonathan Leavitt (who built the first sailing vessel at St. John in 1770), Simonds & White, Gilmour, Rankin & Co., George Thomson, W. & R. Wright, Stackhouse & McLachlan, John Clark, Owens & Duncan, Gass & Stewart, Capt. Cruickshank, Nevins & Fraser, Olive Brothers, Storms & King, Oliver Pitfield, the McDonalds, Thomas E. Millidge, Brown & Anderson, Wellington Brothers, McFee, John Stewart, Joseph K. Dunlop, S. J. King, D. V. Roberts, Hilyard Brothers, Harry Rowan, William Ruddock, David Lynch, W. & J. Lawton, Edward McGuiggan, John Tennant, and others.

At Tynemouth Creek, J. S. Parker and others built ships; at Black River, J. & R. McLeod and others; at Gardiner's Creek, W. & R. Wallace; at Quaco, James Moran, A. Parks & Son, William DeBowe, the Rourkes, Wisharts, and others; at Rockland, R. A. Chapman; at Oromocto, Richard Hawes; at Harvey, Gaius Turner; at Clifton, C. W. Flewelling; at Moss Glen, Gabriel Merritt; at Rexton, Jardine & Co., and throughout the province many others whose names have been forgotten.

Among the prominent owners of wooden ships in New Brunswick were Troop & Son, who owned a great fleet, sailing in every part of the known maritime world; William Thomson & Co., Taylor Brothers, George F. Smith, Oliver Emery & Co., Scammell Brothers, Samuel Schofield, George Berteaux, George Carvill, George McLeod, L. McMann & Sons, Daniel J. McLaughlin, Mills & Jago, Luke Stewart, Donald Carmichael, John M. Taylor, Barton Gandy, W. J. Davidson, George W. Gerow, Vroom & Arnold, George Thomas, Joseph A. Likely, James Kennedy, Zebedee Ring, George Eaton, John Purdy, R. A. & J. Stewart, Oulton Brothers, Alexander Yeats, Robert Robertson & Sons, C. McLauchlan & Son, Henry Vaughan, D. V. Roberts, J. C. Brown, W. W. Turnbull, Pritchard & Son, Joseph W. Penery, Edwin Frost, George F. Baird, Fred E. Sayre, C. A. Palmer, Hall & Fairweather, T. S. Adams, H. J. Olive, and many others.

St. John's Great Shipbuilding Days

Shipbuilding reached its zenith in New Brunswick in 1854, when 135 new vessels, registering 99,426 tons, were added to the provincial fleet, most of these being placed on the St. John registry books. At that date there were on the registry books at St. John 582 vessels, of 119,965 tons.

In 1876 St. John stood forth in the list of shipowning ports of the world. At that period it owned 805 vessels, aggregating 280,073 tons. From that date wooden shipbuilding began to decline. In 1894 the number remaining on the registry at St. John was 488, of 111,888 tons. Year by year the shipping glory of the port continued to fade, until last year there only remained on the register 326 vessels, of 34,841 tons.

Some famous ships were built in New Brunswick. Nehemiah Beckwith, grandfather of Hon. J. D. Hazen, Minister of Marine and Fisheries, built the Lord Sheffield for Benedict Arnold, in 1786. In 1850 the Benjapore, the largest wooden ship then afloat, was built by W. & R. Wright.

About the same year the ship Marco Polo, destined to become one of the most famous ships of her day, was launched from the Smith yard at Courtenay Bay, St. John. She didn't get off to a very good start, as she grounded in the launching and was considerably strained. She made up for this disaster later on by smashing many ocean records. Captain "Bill" Thomas, it is recorded, skidded her across the pond in fifteen days. Under command of Captain Forbes, another driver, she entered the Australian trade, and made some record-breaking passages. This great wooden ship finally closed her career as a collier, leaving her bleaching bones on the shores of Prince Edward Island.

The age of steam soon drove the wooden sailing ship to the wall, every yard in the Province of New Brunswick being as silent as the grave in 1884. Wooden shipbuilding was gone, as everyone believed, forever, leaving behind it, however, a wealth of tradition that could not easily be forgotten. Briefly, this was the New Brunswick of the past as a shipowning community.

To-day's Shipbuilding Industry

What can be said of the New Brunswick of the present? Not very much so far. With the brilliant record of bygone days in mind, and with the fear entertained by many that the government would probably requisition ships as fast as they were built, it was found very difficult to reawaken interest in the construction of wooden craft in New Brunswick. The St. John Board of Trade, impressed with the need of more ships, approached the federal and provincial governments and urged the granting of a bonus or some other form of encouragement to prospective shipbuilders, but there was nothing forthcoming from either quarter.

Finally, after months of anxious effort on the part of shipbuilding promoters, the general contracting firm of Grant and Horne decided to take the plunge. This courageous young firm secured a contract from the imperial director of shipping to build two wooden steamers of a carrying capacity of 3,000 tons. Their plans were approved by English Lloyds, and a yard was secured at Courtenay Bay, upon the site of one of the old shipyards. A mill and moulding loft were soon erected, the ground graded and piles driven for "ways," and a few weeks ago the keel was laid for the first of the ships. It was made the occasion for a simple ceremony, the mayor and president of the Board of trade joining in a complimentary address to the contractors, the chief magistrate afterwards driving the spikes in the keel.

The keel of this new ship, composed of Douglas fir from British Columbia, is 250 feet long. The breadth of the ship is 43 feet 6 inches; depth, 25 feet. With turbine engines it is expected that she will develop a speed of 9½ knots.

The working model does not display the graceful and symmetrical curves which were so marked a feature of the hulls of the clipper ships of half a century ago, but for the most part there is little deviation from the old methods of construction. The saw, however, plays a more important part in the shaping of timbers, although the axe and adze have yet their work to perform.

The keelsons, which are the main backbone of the ship, are a combination of steel and wood, instead of the all-wood keelsons of the old days. There are the main centre keelson and two assistant keelsons of wood, laid side by side, and on top of these is a vertical box girder of steel. The old-fashioned wooden futtock or "crook" is used in the building of the hull. Every precaution is being taken to ensure rigidity and strength. The ship will be supplied with two masts, fitted with powerful derricks. There will be no sails whatever.

In addition to the Grant & Horne firm, there are two other corporations in St. John that are making preparations for the construction of vessels.

The St. John Shipbuilding Company, which has been incorporated, with a capital of one million dollars, and which numbers on its directorate several prominent Canadian steamship men, proposes to establish a yard at St. John and another at Bathurst. This company, which intends to engage in the construction of a fleet of small tugs for the Imperial Government, has been delayed in the accomplishment of its task by the loss of plans, which were on board a torpedoed ship. Duplicate plans have been supplied, and it is expected that a definite announcement will be made by the company in a few days. Thomas Nagle, of St. John, is manager of this company.

D. A. Saker & Co. is the name of the other shipbuilding firm in St. John. This firm has established a yard on what is locally known as the Strait Shore, about midway between the harbor proper and the falls. A mill and moulding loft have been constructed, and preparations are now being made for the ways upon which the first vessel is to be built. It is the intention to start upon a large schooner.

At Moss Glen, fourteen miles from the city, on the Kennebecasis River, Peter McIntyre, of St. John, has a schooner of 425 tons framed up, L. P. McLean being the master builder. The dimensions of the vessel are: 136 ft. length of keel, 35 ft. breadth of beam, 12 ft. 6 in. depth of hold. About twenty men are at work upon this vessel. With the exception of a little Southern pine, native woods are being used entirely in her construction.

At Alma, Albert County, C. T. White & Co., lumber merchants, have made a start on a large schooner.

The Eureka Shipbuilding Company, Ltd., composed of Frank

Ingersoll, Joseph E. Gaskill, Frederick S. McLaughlin, Frank L. Lakeman, and N. Mark Mills, all of Charlotte County, N.B., with a capital stock of $32,000, has been incorporated. This company has two schooners under construction at Meteghan, N.S.

The Rosebank Shipbuilding Company, of Chatham, is preparing to construct vessels. They expect to start building at an early date.

The International Shipbuilding Company, with a capital of $2,000,000, has been incorporated, for the purpose of building steel and wooden ships at Newcastle, N.B.

Up to the present time this constitutes the sole development of wooden shipbuilding in New Brunswick.

In the adjoining Province of Nova Scotia the art of wooden shipbuilding has not been allowed to languish as in New Brunswick, so that when the demand for increased production in ships came, builders were able to respond more quickly than in New Brunswick. At the present time Nova Scotia is quite a busy hive of industry in this respect.

"The Mabel Brown"

The accompanying illustration is from a photograph of the motor-driven five-masted schooner "Mabel Brown," launched by the H. W. Brown Company, Ltd., Vancouver, B.C., who constructed the vessel. The "Mabel Brown" is the first of the auxiliary wooden schooners built in British Columbia, and on her maiden trip carried 1,534,000 feet of lumber for the Government of New South Wales. The vessel

This ship carried 1,534,000 feet of lumber to Australia on her maiden trip.

is built throughout of British Columbia Douglas fir. She took on her load in ten days at the plant of the Victoria Lumber and Manufacturing Company, Ltd., Chemainus, B.C., and occupied about 45 days in reaching Sydney. The freight charges on her cargo amounted to $45,000. The "Mabel Brown" is the first of many similar vessels which are now being built in Canada.

The Pacific Marine Review, in an article on British Columbia Shipbuilding, says:—A year ago there was not a large ship being built in the province of British Columbia and the industry did not represent an output of much more than $50,000. Today there are $27,000,000 worth of steel and wooden vessels under construction or contracted for.

While the shipbuilding industry of the province is by no means new—wooden ships were built here as far back as 1788—its firm establishment as one of the chief assets of the West Coast of Canada has taken place within the year. It is of course due to the ever-increasing demand for ocean tonnage.

It was at Nootka Sound that the first wooden ship was built in 1788, since when a number of small vessels have been constructed from time to time. With the growth of Vancouver and Victoria, shipbuilding and repair yards were established and several steamers and sailing ships of medium dimensions produced.

A year ago, however, there was not a single large vessel either building or contracted for in British Columbia. The Aid to Shipping Act, passed by the Conservative Government early in 1916, drew attention to the facilities available for shipbuilding, and soon afterwards contracts were placed for the construction of ten auxiliary-power wooden schooners.

This particular type of vessel costs about $150,000, and is similar to the motor sail ships that have been built in the Pacific States. They are 225 feet long, 44 feet in beam and 32 feet deep. Bolinder engines of 160 h.p. drive twin screws.

In order to assist communication between Eastern and Western Canada through the Panama Canal the Dominion Government decided to establish a line of vessels and have already let contracts for two ships of the auxiliary schooner type.

This started the activity, and contracts amounting to $18,000,000 had been let up to a short time ago. The Imperial Munitions Board has also let contracts for a further 33 wooden steamers in this province.

The total programme of construction now amounts to more than $27,000,000 in value.

U. S. Pacific Coast Timber Schedule for Wooden Ships

The lumber schedule is governed strictly by the following rules:

1. Dimensions of timbers in the form to be used in the ship are net, after surfacing. Material must be sawed large enough to surface down to these dimensions. Dimensions and quantities in the rough, in accordance with the usual milling practice, are given separately for the information of manufacturers.

2. The specification of "selected common" Douglas fir means the following, as quoted from the Standard Schedule of Grading Rules, etc., for Douglas fir and associated species, No. 6, issued by the Pacific Lumber Inspection Bureau, 1912:

"Selected Common—This is a grade selected from the grade of No. 1 common, and shall consist of lumber free from defects that materially impair the strength of the piece, well manufactured, and suitable for high-class constructional and structural purposes or the purposes for which it is intended, including bridge timbers, floor joists, ship timbers, factories and warehouses, designed to carry heavy loads, etc."

The following specifications, taken from the same schedule, shall govern timber used for ship plank and decking:

"No. 1 Ship Plank—Including outboard planking, garboards, wales, clamps, rails and lumber for similar purposes, shall be firm grain, free from large knots or other defects impairing its use for the purposes intended.

"Will allow small, tight, hard knots when not on face corners or calking seam. Bright sap on face side edges not exceeding one-quarter the width or thickness. Small pitch pockets not extending through the piece. Said defects to be considered in connection with size of piece and its quality otherwise. Must be well sawn.

"Decking—Shall be uniformly sawn, firm grain, and free from knots and defects on one face and caulking edges. Flat sizes shall show edge grain on broad face. Will allow pin and small knots on underside and lower part of caulking edges. Bright sap, whether green or seasoned, on face sided corner not exceeding one-quarter the width or one-third the length."

3. The specifications governing all other grades of Douglas fir are given in the Standard Schedule of Grading Rules issued by the Pacific Lumber Inspection Bureau, 1912.

4. Hardwood items shall be of selected stock, high-grade structural timbers.

5. Knees shall be free from rot, heart or ring shake, large or loose knots, and other defects which would impair their strength for the purposes intended.

6. Treenails shall be of clear all-heart wood, straight-grained, and thoroughly air-dried.

Ship Keels and Other Special Timbers

Outline of An Industry Peculiar to Wooden Ship Construction—Types of Vessels Built in the Maritime Provinces

Written Specially for the Canada Lumberman by Elihu Woodworth

THE business of getting out wooden ship-knees can scarcely be considered an exact science. It does not even require a thorough knowledge of mathematics. Experience teaches, but the selection of suitable trees for making knees appears to be a matter of intuition rather than the result of education. The results obtained by some specialists in ship-knees compared with the returns made by other equally faithful workers leads to the conclusion that the successful knee-producer, like the poet, is born, not made.

To make a wooden ship knee requires, as is generally known, the principal root and part of the trunk of a suitable tree. The root must practically run at right angles with the trunk, and in most cases its size and direction are fairly indicated above ground. Fuller knowledge may generally be obtained by clearing away the moss above the roots, and when this is done the man who is guided by intuition is usually able to decide whether the tree will suit his requirements or not. If he goes on with the work he may not have a single logical reason to give for his decision, but he generally gets what he is after. But finding a tree with an apparently suitable root is by no means a guarantee of success. A root may start out straight from the trunk with good promise of continuing that course, and then make a sudden dip into the earth, and thus prove too short for the purpose required. Or it may happen, after the surface earth has been removed and the roots have been cut off, that the heart of the tree will be found rotten and consequently valueless. And it has sometimes happened that the essential root has been split and spoilt by the tree being blown down before the felling process had been completed. But assuming that the tree is successfully felled, the root the right size and shape and the trunk sound, the next thing is to cut off the trunk at the height required for the knee. In former times the remainder of the trunk was usually left to rot where it fell, but nowadays lumber is too valuable to be wasted in that manner. In former times, too, the knee was hewed into shape with the axe, which was naturally a tedious as well as laborious process. Now the work is generally done in the mill at the shipyard by using a band saw, and is done much more easily and quickly. In some recently opened or re-opened yards, where some labor-saving appliances are still lacking and band saws have not yet been installed, the work of shaping the knees is still done in the primitive manner, but the old way is generally regarded as a waste of time and energy and will undoubtedly be abandoned wherever circumstances will permit.

How Ships Knees are Used

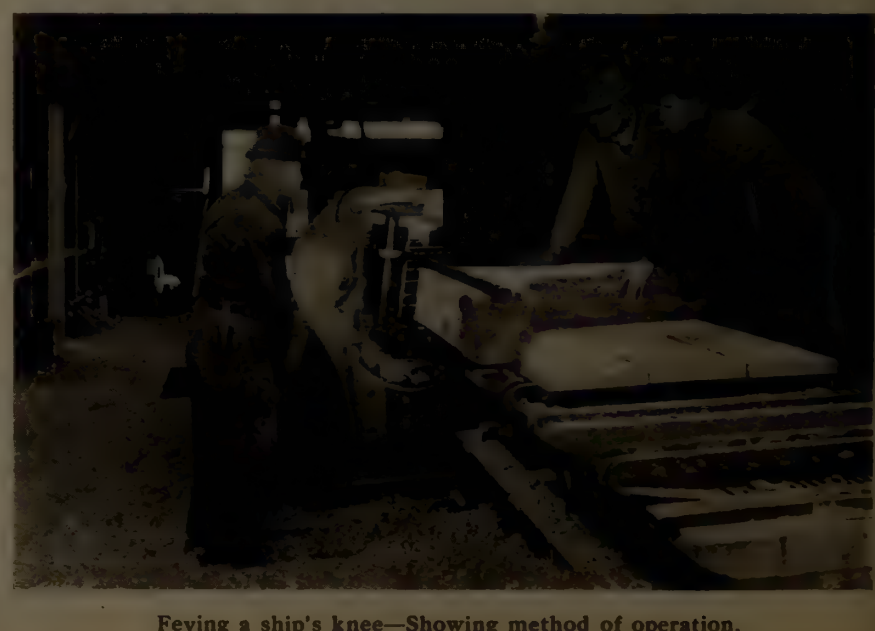
The size of knees depends, of course, upon the position in which they are to be placed. They are supposed to approximate the thickness of the beams or timbers they are designed to support, and, consequently, in vessels of from two hundred to five hundred tons, may range from six to ten inches square. Of course, the knees used to support and strengthen the stem and stem posts are much larger and differ somewhat in shape from the ones in general use. In former times when only wooden knees were used a knee was placed under each end of each deck beam. Now iron knees are used almost exclusively for this purpose, and the part of the knee which goes against the side of the vessel is made longer and curved to fit the vessel's side. Knees are placed horizontally between the deck beams on both sides of each end of each beam, and the sides of the knees that go against the side of the vessel meet between the deck beams. When parts of the deck beams are cut out to make hatches, the timbers which are put for and aft across the ends of the beams to form the sides of the hatches are braced with knees in a similar manner. Two knees of the same size and shape are put back to back under the middle of each deck beam with the lower ends resting on the keelson. The upright parts must, of course, be long enough to reach from beam to keelson, the lower ends must not be over two feet long. Similar knees are used as posts for the deck houses, the perpendicular part being whatever length is required for the height of the house, the other end being just long enough to admit of being conveniently bolted to the deck. Other and generally smaller knees are used wherever there is a possibility of them adding to the strength of the vessel, and the additional strength afforded by well-placed knees is almost beyond belief or comprehension.

Judge Haliburton (Sam Seick) tells of a Yankee who went to Prince Edward Island and advertised that he would give prizes of five, three and two pounds for the three largest ship knees brought him, the knee to be delivered at Charlottetown on a certain date. Every farmer in the Island thought he knew where the three biggest knees were to be found, and on the day appointed hundreds of teams came into Charlottetown, each bringing three enormous knees. The Yankee was on hand and after making a careful selection promptly paid the prizes. The farmers looked at each other. They realized that they had been buncoed, but could not quite understand how it had been done. At last one of them said to the Yankee, "what are we going to do with these we have left?" He told them he had nothing to do with that, that it was their own business, but he finally made them a ridiculously low offer, and, as the knees were of no use to the farmers they accepted it. The shrewd Yankee thus became the owner of a large schooner load of prime knees at a merely nominal price, but it is not likely that such a speculation could be repeated today, for the owners of any kind of ship timber are now pretty well aware of its value.

The quantity of timber required in the construction of a vessel is surprisingly large. If the timber required for a vessel of any specified size were all collected together it would be difficult to convince anyone unfamiliar with shipbuilding that it would all be used in constructing a vessel of the dimensions specified. And when one has seen the huge timbers moulded and fitted together to form a ship, and when that ship has her timbers covered without and within with thick planks strongly bolted, and is braced wherever it will do any good with knees of marvellous strength it is difficult to realize that a time may come when she will be no better fitted to cope with disaster than a vessel of glass. The danger of shipwreck has always attended navigation and must ever be counted among the possibilities, but now a new peril has been added to the perils of the sea and the strongest vessel that can be built may be torn to fragments by a single torpedo.

Sizes and Use of Various Ship Timbers

A few notes regarding the size of the timber used in building a ship may be of interest. Of course, the size of the timbers differ in accordance with the size of the vessel under construction, so it is evident that no fixed rule can be given, but by taking the dimensions of a three-masted schooner recently launched in Nova Scotia a general idea may be formed. The schooner in question is 460 tons register or 500 tons gross, and will carry about 800 tons of cargo. Her keel, which is 142 feet long, is fourteen inches square and is composed of six pieces which are scarfed and bolted together in the strongest manner possible. Beneath this goes the "shoe," which is the same length and width as the keel and ten inches deep. When these are fitted together the keel is laid on a row of blocks firmly fixed so as to sustain the weight of the vessel without settling and with the proper degree of inclination toward the water to make launching practicable. The floor timbers, which may be a foot or more square, are then laid across the keel a few inches apart and in some cases almost or quite touching, and the side timbers are carried up to the height required. The



Feying a ship's knee—Showing method of operation.

stem and stern posts are then put in and secured to the keel, and as they both slope outward the length of the vessel on deck or "over all" may be some twenty feet more than the length of keel. The keelson is then put in and this consists of three timbers of the width and thickness of the keel, placed together vertically and running across the floor timbers parallel with the keel. Galvanized bolts of a suitable size are then driven through keelson, floor timbers, keel and shoe and the frame is ready for ceiling and planking. Ceiling is the first operation, and consists of putting planks in the inside of the timbers from both sides of the keelson up. As the width or "beam" of the vessel under construction is 35½ feet, and the depth of hold 13 feet, an approximate idea of the planks required may be obtained. The planks next to the keelson are nine or ten inches thick and the thickness of the planks is reduced gradually to five or six inches when the top sides are reached. The "clamps" or top planks running the whole length of the vessel, must, however, be nine or ten inches thick, for on them the ends of the deck beams must rest. The garboard strake, or first line of planks on the outside is chamfered into the keel the whole length and bolted through. The planks vary in thickness according to their position and may range from eight or nine inches at the keel to five or six inches at the water line. The bottom planks are of hardwood, birch, beech or maple, birch being generally used—while spruce or hard pine is used on the top sides and rail. The planks have nearly all to be moulded to fit the positions they are designed to occupy, and many of them have to be steamed so that they may be bent to fit the curves of the frame. After the planks are in place any projecting edges or inequalities are dubbed off so as to make the surface as smooth as possible, and then holes are bored through planks, timbers and ceiling. Through these holes treenails, or wooden bolts, are driven, and these are firmly wedged at both ends so that the outside of the vessel is compactly held together. After the deck beams are laid cross knees are placed under their ends and run down the ceiling to which they are bolted. The wooden knees are put in between the ends of the deck beams as before described, the waterways are put down and the deck laid and the vessel is ready for caulking.

This is not intended to be a complete guide to shipbuilding, but merely to give the uninitiated a slight glimpse of the process. It may be mentioned in passing that knees are not the only parts of a ship's frame that depend upon roots. Nearly all the crooked timbers have to be cut with part of the main root left on the trunk in order to give the required curve. Occasionally a crooked trunk may be found that will make a timber of the desired shape without going into the ground, but as a rule every tree that is felled for ship timber has to have part of the biggest root left on. This adds very much to the difficulty of getting out ship timber in winter when the ground is frozen or covered with snow, or both.

Increased Cost of Timber and Labor

A very important consideration in the revival of shipbuilding is the enormous increase in prices. Timber is still plentiful in many places, but the price has at least doubled owing to the advance in wages, which are fully twice as high as they were a few years ago. Skilled workmen, such as ship-smiths, dubbers and caulkers, can scarcely be had at any price, but this trouble will correct itself, for new men are now learning these trades, and the supply will grow to meet the demand. Materials such as iron, oakum, paint, cordage, canvas, anchors and chains have doubled and trebled in price, while in some cases some of the articles mentioned have actually sold for four times the price they commanded a few years ago. And yet in nearly every case where a man has built a vessel for his own use he has been offered sufficient profit on his investment to induce him to sell.

One notable thing about the revival of shipbuilding is the fact that practically all the vessels that have been built in the Maritime Provinces in recent years have been fore and aft or schooner rigged. With the exception of the fishing fleet of two-masters, the great majority of the vessels built have been three-masted or tern schooners, but probably quite a number of four-masters will be turned off next year. In early days every vessel of two masts was square-rigged if measuring fifty tons or more. The first two-masted fore-and-aft vessel ever built is said to have been launched at Gloucester, Mass., in 1714, and was said to be a complete innovation on any rig ever seen up to that date. She is also said to be responsible for the name by which vessels of her rig are distinguished today. It is said that a bystander at her launching exclaimed, as she slid down the ways: "How she schoons," and that her builder immediately remarked: "If she schoons she must be a schooner." This story may or may not be true, but it is evident that it took the new rig a long time to become popular except for vessels of small tonnage, and even in that case they sometimes found the sloop, or one-masted vessel a stubborn competitor. In the middle of last century the British Navy had a large gun-brig squadron consisting of sturdy two-masted vessels with yards across both masts, but, of course, much smaller than ships of the line or even frigates. At the same time, many fine brigs were trading between the provinces and the United States and West Indies. These soon had to give way to a new rig called a brigantine or hermaphoodite—a vessel with its foremast rigged like a full rigged brig and its mainmast like a schooner. This was a very popular rig for many years and was claimed by many shipmasters to be superior to either the brig or schooner as it provided sails adapted for any and every occasion. Of course, the full-rigged ship was always considered THE rig for big vessels, but at one time the bark, with two square-rigged masts and a schooner rig on the mizen, appeared to be more popular for everything but the very largest. Then came the barkentine, a bark of smaller size with only the foremast square-rigged. This style of rig was quite popular for a time and may still be found occasionally. A variant of the brig and schooner, or rather, perhaps, a cross between them, was called a topsail-schooner and was a rig with the lower sails precisely like a two-masted schooner, but with one square sail on the fore-topmast. Sometimes another yard and another sail were added and the vessel then became a "top-gallant schooner." Such rigs were quite common at one time and appeared to give satisfaction, but probably are now extinct. The evolution of the big many-masted schooner began in the latter part of the last century and was confined almost exclusively to the State of Maine. The first four-masted schooner was built at Bath, Me., in 1880, and measured 995 tons gross. Other four-masters soon followed, and in 1882 the first schooner of over a thousand tons was also built at Bath. She had four masts and registered 1,137 tons. The first five-masted schooner was built in 1888 and registered 1,778 tons. No other five-master was built for ten years, but in the meantime many big four-masters were turned off, and among them the Frank A. Palmer, launched in 1897 and registering 2,014 tons. The second five-master, a vessel of 2,440 tons, was launched in 1898. The largest five-master ever built was launched two years later and registered 2,663 tons. In the same year two six-masted schooners were launched from Maine shipyards—the George W. Wells, of 2,970 tons, and the Eleanor A. Percy, of 3,401 tons. These were the largest wooden ships ever built, for the seven-master Thomas W. Lawson, while considerably larger, was built of steel. Counting the wooden ships only, a fleet of twenty-eight schooners, measuring from 1,732 to 3,401 tons, was turned off in twenty years from the Maine shipyards. The dimensions of some of these monster schooners are startling. Here are a few figures from one of them: "Length over all, 395 feet; beam, 50 feet; moulded depth, 34 feet 5 inches; displacement, 10,000 tons; dead weight carrying capacity, 7,500 tons; height mainmast, step to truck, 182 feet; total sail area, 40,617 square feet." And it must not be forgotten that no record is here given of the scores of two, three and four-masted schooners ranging from 100 to 1,700 tons which were built in the same state during the same period.

In the Maritime Provinces at the same time the square-rigger still retained public favor. The schooner was well thought of up to six or seven hundred tons, but vessels above that tonnage were still rigged as barks and ships. Now the tendency is to build nothing but schooners, and larger ones are being built every year. It is not likely that an attempt will be made to rival the mammoth "wind jammers" of our neighbors, but larger schooners will be built in the provinces within a year or two than have ever been built here before.

Encouragement of Shipbui ding in Nova Scotia

The Premier of Nova Scotia introduced a bill into the Legislature recently providing for the encouragement of shipbuilding in the province. The bill provides for a shipbuilding commission of five members and a secretary, to investigate the facilities for shipbuilding in the province and for the manufacture of articles incidental thereto, and to make suggestions for the adoption of rules and regulations to facilitate the development of such industry. The commission is empowered to engage technical assistance and to make arrangements with other similar commissions or departments in Canada, to work together and it may be created a corporate body, under the name of the Nova Scotia Shipbuilding Commission, with all the powers of a corporation. If so formed, it will have power to build purchase and own vessels or acquire shares in same and to operate vessels of all kinds to establish shipbuilding plants, to purchase existing undertakings for shipbuilding purposes, and to promote and finance companies for such purposes. Power will also be given the commission to issue bonds and other securities, and for the purpose of establishing the commission the government will be authorized to raise $2 000 000 by the issue of debentures or consolidated stock of the province, for the expenses of the commission, and for subsidies granted to any company engaged in the building, equipment, or operation of ships.

The Pacific Shipbuilding Co., Ltd., has been incorporated under the Dominion Companies Act with an authorized capital of $50 000 and office at Vancouver. The incorporators include J. C. Shields, lumberman, Vancouver, and J. T. Robinson, broker, Kamloops.

Timber Requirements of Naval Service

Intimate Relation Between Lumber Industry and an Important Branch of Government's War Administration—Quantities and Varieties Required

Written specially for the Canada Lumberman by J. A. Wilson. Director of Naval Stores

IN spite of the many developments of shipbuilding practice during the past century the relations between the lumber industry and the navies of the world, which have existed since the earliest days of navigation, continue to be close and intimate. Apart altogether from the present activity in wooden shipbuilding, occasioned by the shortage of tonnage consequent to the withdrawal of German shipping from the trade routes of the world and the ravages of the U-boat campaign, there are important requirements which are filled by the lumber industry year after year in the normal course of naval work. These requirements are naturally greatly increased by the extraordinary activities in the exercise of sea power and the great extension of naval operations in the war zones in European waters and elsewhere. The increase in the number and variety of craft employed brings with it a corresponding increase in the use of those materials used in the construction and fitting of ships, harbors, and other naval work. Timber of many varieties will always play an important part in naval work.

The Naval Service Requirements

With Canada's magnificent military effort in the war the public is familiar. It has been performed in the full limelight and rightly given the widest publicity. With her many other war activities the public are not so well acquainted. Many of them must, from their nature, be carried out without publicity. Of these the work of the Naval Service is one of the principal. Though not on the same scale as that of the sister service, this work is very important and far-reaching. The personnel is large and the quantity of material of all kinds necessary for its proper performance is great. It covers an immense range of articles; practically no field of industry is not drawn on for supplies of one kind or another. Not the least important are the timber requirements.

A glance at stock lists of His Majesty's Canadian Dockyards will show the variety of timber used, all of which is of interest to Canadian lumber merchants, and some, and these of which the quantities required are largest, to Canadian lumber producers. Commencing with pine, it continues through elm, cedar, greenhart, sabiou, elm, oak, ash, beech, hornbean, maple, birch, sycamore, teak, mahogany, lignum vitae, spruce of all grades of boards and deals, special qualities for oars, silver spruce for aeroplane work, British Columbia fir, poles and masts of all kinds and sizes for different work.

The quantities of the various woods used, of course, vary greatly. Of the rarer hardwoods for special work only the requirements are small, while the consumption of the more commonly used varieties reaches a fairly large figure, as will be seen from the following table:

Department of the Naval Service Expenditure of Lumber, 1916-1917

	Ft. B.M.
Ash	1,300
Birch	2.100
Cedar	10,000
Elm	5,200
Fir	125,000
Lignum vitae (pounds)	600
Mahogany	3,000
Oak	6,000
Pine	60,000
Spruce	600000
Teak	12,000

These figures are consumption from stock, and do not include lumber used in shipbuilding, construction of wharves, buildings, or other work done under contract.

For obvious reasons the features of most importance and interest to the Canadian lumberman and merchant cannot be dealt with fully at this time, as the details of the actual construction of wooden ships for purely naval purposes cannot be given yet. When the full extent of these activities may be published, Canada will have every reason to be gratified at the extent and importance of the contribution of her shipbuilders. A very large proportion of the craft built for work in this country have been wooden ships. Particulars have already been published of the remarkable work of two well-known firms in turning out 550 eighty-foot launches complete and accepted, after trial, in less than as many days. These vessels were all built of Canadian timber, and these first orders have been followed by others for craft of larger size for more important duties.

The export of timber for war purposes is another feature which will be of interest to Canada Lumberman readers. Owing to the closing of the Baltic, shutting off in a great measure the important British lumber trade with the Russian and Swedish ports, the importance of the Canadian market was greatly enhanced, and this country was called on to supply many of those requirements which were usually filled from Northern European sources. Large quantities of spruce and other timber were purchased from Canadian mills, and arrangements were made for their transport to England and France. The Imperial Government supplied the ocean tonnage and the Overseas Transport Service, under the able direction of Mr. A. H. Harris, director of overseas transport, arranged for the loading of the cargoes. In this way several hundred million feet of timber were exported during the year ending March 31, 1917, from Maritime Province and St. Lawrence ports, Newfoundland and the Pacific Coast.

The Naval Service is directly interested in these activities, having control of the vessels while in Canadian waters. This large tonnage was handled without delay or difficulty of any kind. This export trade was undoubtedly of great value to the lumber industry at a critical time in its history. The extension of the work of the forestry units now in France and England, rendering possible the use of home-grown timber, has resulted in a considerable falling off in this trade, which will not probably attain as high a figure again. The shipments this year so far have been confined to limited quantities of woods for special purposes.

Whether in the future the wooden cargo carrier can compete with her steel sister ship remains to be seen. However that may be, the lumber industry will always be called on to contribute a large and valuable quota to the material used by the naval service, and it would be a fatal mistake if the lumberman, under any conditions, looses his interest in the maintenance of that sea power to which the naval service of Canada is lending such assistance as lies within its power.

Situated at vital strategic points, Canada's dockyards at Halifax and Esquimalt will always be centres of naval activity, and, as such, will be important consumers of timber and timber products.

Newfoundland Shipyards Busy

Most of Her Fleet Sold Early During War—Now Being Replaced by Vessels Built in the Colony

Written specially for the Canada Lumberman by J. W. McGrath

IN the early colonial days all of Newfoundland's shipping came from England, but as time passed Newfoundland fishermen began to build their own vessels, both those used in fishing around the coasts and in the Labrador waters, as well as a fleet of larger vessels which prosecuted the seal fishery in winter seasons, after which they were used for the remainder of the year in carrying the products of the country to foreign ports and bringing back provisions and groceries and the many other essentials required in the industrial and commercial life of the colony. Many of these ships were as strong as "Newfoundland oak" and English iron could make, standing firmly against a rigorous clime and the storms and fierce seas which are known only in the North, ofttimes surrounded with fields of Arctic ice. As time brings many changes, so with the passing of years much of this great native fleet of all classes of vessels passed away and shipbuilding gradually died out. Our fishermen, instead of building their fishing vessels as did their fathers of old, preferred to purchase American and Canadian-built vessels. Our marine fleet of ocean-wide carriers became of late years a group of cosmopolitan bottoms, of English, American, Canadian, Norwegian, and Dutch build. But with the advent of the war other great changes in the shipping life of the country came about.

Disappearance of the Old Fleet

A large and splendid fleet of steel steamships, which were owned by our commercial men and used in winter months in connection with the seal fishery and in summer in our foreign trade, were all sold to the Russian Government. The loss was seriously felt in connection with our trade and shipping, and cannot be replaced for some time after the war is over. As a consequence, much more work and far off voyages had to be undertaken by our wooden fleet of sailing vessels,

and with the pressing of great number of these vessels into the foreign-going trade the transportation and shipping facilities of the colony have been strained to the utmost.

Since the outbreak of the war Newfoundland has lost, through the submarine and the storms of the Atlantic, no less than sixty of its foreign-going sailing vessels. This, together with the loss of its steel fleet sold to Russia meant a very serious outlook. Newfoundlanders, however, have gone to work to build their own ships, and that they will succeed there is not the slightest reason to doubt. By the end of the present year from twenty-five to thirty new vessels, averaging from one hundred and fifty to five hundred tons each, built by Newfoundlanders of Newfoundland wood, will have been added to our foreign-going fleet of sailing vessels. Many of these ships will have motor power. By the end of 1918 at least one hundred new sailing vessels will be added to our fleet. There is scarcely a fishing village in the country which is not engaged in one way or another with the building of ships at present, and the sound of the mallet, caulking iron, and saw are heard from early morn to late at night.

Newfoundland Forests Furnishing the Timbers

Business a short time ago was not looking any too bright for the lumbermen of Newfoundland, inasmuch as curtailment in the shipping of lumber abroad was inevitable, owing to lack of shipping; but with ships building in every other district of the colony the lumberman's hands are now full to supply the necessary timber. As a result, also, certain sections of Newfoundland forests which have been considered to be of very little service have suddenly become of great commercial value and centres of much life and activity. The hardwood forests of birch, witch-hazel, and juniper are now coming into their own. Up to the present little of these woods was cut or sawn into timber, as the market was limited. When the building of ships commenced it was found that Newfoundland had an extensive supply of these woods eminently suited for shipbuilding purposes. The style of vessels built so far has been of the tern class, as these have been found most suitable for the fish carrying trade between here and European and South American markets. It is more than probable that, as larger vessels are being built, other styles of ships will be drafted.

It is thought by some who are competent to judge that shipbuilding has come to stay in Newfoundland, and henceforth may be counted as one of its permanent industries. This seems evident from some of the dockyards and extensive plants that are being installed.

The Harbor Grace Shipbuilding Company have bought the premises and plant of one of the largest and most up-to-date whaling plants in the colony, and, with alterations and extensions, are converting it into a large modern electrically-equipped shipyard, where they have laid the keels of four sailing vessels from four to five hundred tons register, but they are also arranging to build iron and steel steamships next season.

The great pulp and paper concern owned by the Northcliffes of England are building three wooden vessels at Botwoodville, their port of shipping. These vessels will soon be ready to launch, when four or five more keels for still larger vessels will be laid.

The pit prop firm of J. O. Williams & Co., Barry, England, with branch offices at St. John's are building three vessels, which will be ready for foreign voyages at the end of the present year. Then they will lay the keels of three or four other vessels. These firms have established large, well-equipped yards, with modern machinery, and there is every reason to think that they will continue in the business.

With one exception, all the work in the planning, building, and construction of these vessels has been done by Newfoundlanders. Not only that, but the making and fitting of the spars, making of sails and rigging, is all native work, and, without a doubt, every new ship sailing away from the shores of Newfoundland will be captained and crewed by Newfoundlanders.

The shipbuilding plant at Harbor Grace is owned by a Norwegian firm, whose headquarters are at New York, and who are the owners of a line of steamships sailing between America and Norway, and otherwise largely interested in shipping circles.

Roughly estimated, the value of ships which will have been built in the shipyards of this country by the end of 1918 will be between eight and ten million dollars.

Timber Consumption

From the standpoint of timber construction it may be said that the construction of the various shops, slips, etc., entailed the consumption of nearly three million feet. In addition to this, each of the boats will take probably seventy thousand feet of timber for the interior construction.

Particular attention is also drawn to the large poles which are used for the overhead trolleys, each of the poles supporting the head of these cables being 120 feet high. The masts of the vessels will also require to be 100 feet long or over.

It will be seen, therefore, that the lumber industry in British Columbia has benefited to no small degree through the construction of these vessels.

Wooden Ships Have Great Vitality

With the revival of the industry of wooden shipbuilding, the following historical facts are of special interest. They are gleaned from an article dealing with the life of wooden ships, which appeared in a London publication in October, 1902:

As a general rule the lifetime of a ship built of the very best material scarcely exceeds 120 years. To be sure there are exceptions. Perhaps the most remarkable of these is the case of the whaler "True Love," of Hull. The "True Love" was a bark of 248 tons, and was built in Philadelphia in 1748. After she had sailed for a few years under the American flag she was purchased by an Englishman and converted into a whaler. When she was ninety-seven years old—old enough to be retired—she still voyaged to the Arctic Ocean. After changing hands once again she was still in active commission for forty-four years as a carrier of wood in the Baltic Sea. Finally, after an active life of 139 years she succumbed to the inevitable axe.

Still another hoary ship was the sailing vessel "Betsy Caine." The exact date of her launching is not known, but it is definitely recorded that in 1688 she bore the name of "Princess Marie," and had the honor of carrying Prince William of Orange to England. She was then used for a time as a pleasure yacht by Queen Anne. After her period of royal usefulness had passed she was sold and re-christened "Betsy Caine." Her end was pathetic. She was shipwrecked at Tynemouth in 1827, after she had carried the English flag uninterruptedly for 139 years.

A long life was also granted to the three-masted schooner "Three Sisters," a contemporary of the "Betsy Caine." She had taken part in 1689 of the siege of Londonderry. At the beginning of the last century, after she had attained the respectable age of 130, she was still voyaging in the Irish Sea.

In an account of old ships, the brig "Brotherly Love," which carried Captain Cook on many a notable voyage, should not be omitted. After a service of 140 years she sank in a collision in the harbor of Hamburg.

An Old Danish Ship

In November, 1892, the Danish ship "De Tree Sostrene" cast anchor in the harbor of Dundee. Some curious person hit upon the idea of looking up the history of the vessel. The investigation proved that the Danish ship was built in 1772 in Rudkjobing and was at that time 120 years of age.

The "Success," which voyaged from one English port and another, was launched in 1789. As late as 1895 she made a voyage to Australia, and later crossed the Atlantic Ocean.

An investigation carried out some time ago by the shipping register officials of Great Britain showed that on their books were recorded twenty-four English ships over 100 years old, and thirteen over ninety-five years old. A ship twenty-six years old was reckoned "middle age."

It is, of course, difficult to ascertain what is the maximum term of service of a steamship under the most favorable conditions. It is remarkable that of the steamers built from 1815 to 1830 not a single one seems to be in existence. This is perhaps due not so much to lack of endurance in the steamship as to the fact that the cost of running a modern vessel is less than that of an old-timer. The oldest vessel of the English merchant fleet is the side-wheeler "Sir Charles Ogles," of Halifax, built in Dartmouth in 1830. The oldest English iron ship is the Cardiff ship "Swift," which is now (1902) seventy-one years old, and is still in active service.

The article also notes the fact that recent investigations showed beyond doubt that the oldest warship extant is the "Victory." The "Victory" was launched in 1765. She is still doing service as a training ship at Portsmouth.

time owned mills at Montford and other points, but lately manu- the railway, of which T. DesBrisay is the resident superintendent.

Lloyd's and Pacific Coast Auxiliary Schooners

In view of the fact that the auxiliary motor vessels now building on the Pacific Coast are of a new type, it is desirable that underwriters should understand that the construction is somewhat experimental at present, says "Fairplay," London. Several of the vessels now in commission have proved difficult to handle in narrow waterways, and an effort is being made to insert a clause in policies to the following effect:

"Warranted to be towed in and out of Grays Harbor, Williams Harbor, Coos and Humboldt Bays, and to tow out of Columbia River."

As the value of the timber cargoes carried by these vessels runs into a considerable figure, underwriters on cargo would be well advised to stipulate for a similar clause if vessels load their timber at any of the above-named places.

How Modern Wooden Ships Are Constructed

Details of Methods in Use for Laying Out Yards—Selection of Timbers, Building and Erecting Frames—Equipment and Material Required

THE construction of a wooden vessel is rather a mysterious matter to most people, but the materials used, methods adopted and equipment involved have become sufficiently standardized to permit of being definitely described in a practical manner. For what is contained in the following article, including illustrations and information, we are indebted to a series of articles in the Marine Review, of Cleveland, Ohio, by H. Cole, Estep.

Before considering the design and construction of ships in detail, it is advisable briefly to consider the methods of shaping and fashioning timbers for ship construction and also the principal methods of fastening the various elements together.

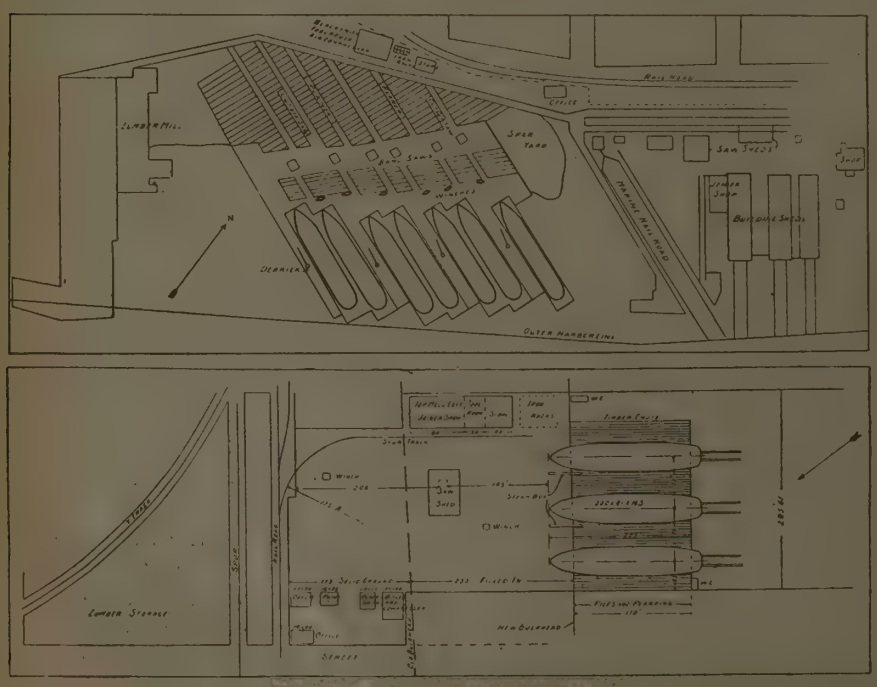
Generally speaking, timbers are shaped by sawing, chopping, planing and boring. As far as possible, in modern wooden shipyards, machines are supplanting hand labor for all of these operations. Band saws or jig saws, together with common circular saws are used for a great variety of operations. Air-driven boring augers are used and special machines have been developed for beveling timbers and performing other operations peculiar to shipbuilding. In many cases, however, hand tools must be used, as for instance in dubbing-off the inside of the hull preparatory to laying the ceiling. For many operations such as this, the adz is indispensable. For rough hewing, axes are employed, while hand planes, bits, chisels, and all the tools found in the carpenter's kit also are utilized.

For fastenings, dowels, treenails, drift bolts, spikes and screw bolts are employed. The various pieces may also be scarfed, that is, beveled together, so as to add to the strength of the joint.

Treenails are usually 1¼ inches in diameter and from 26 to 30 inches long. They are made of hard wood, usually locust, and are used chiefly for fastening the planking and ceiling to the frames. For this purpose a hole the scant diameter of the treenail is bored in the [illegible] to be fastened and the treenail is driven home with an air hammer. After it is in place, it is cut off, split on the end, and wedged to a tight fit. The subsequent action of the water is supposed to swell the treenail and make it fit tighter.

Although treenails are used extensively in modern shipbuilding, there is doubt as to their efficiency after the ship has had an opportunity to work in a seaway. Undoubtedly, however, they were employed in the construction of the ark, for want of knowledge of more modern fastenings, and this is a sufficient recommendation for their continued use, in the eyes of many old-line shipbuilders. The chief virtue of treenails seems to lie in the fact that they work with the ship, and therefore do not present as unyielding a resistance as a steel fastening.

To supplement treenails, however, in fastening the main members of wooden ships together, steel or iron drift-bolts are used. Usually they are about 1 inch in diameter. They are generally driven by air hammers in holes bored 1/16 inch smaller in diameter than the bolt. Although the difference between the size of the hole and that of the bolt is small, they hold tenaciously, especially when the ship is new. It is said that drift-bolts driven 3 feet into a fir timber hold so fast that they break in tension before they pull out. Wherever possible such bolts are driven through and clenched on steel rings in the inside.



Two plans of shipyard layouts.

For "Sticking" the planking to the frames and other preliminary fastenings, as well as for securing the deck planks, galvanized standard ship spikes are used. Usually they are ½ inch square and 8 or 10 inches long. Screw bolts also are used for some forms of fastenings, as well as bolts fitted with washers and nuts. The latter may be taken up from time to time as required.

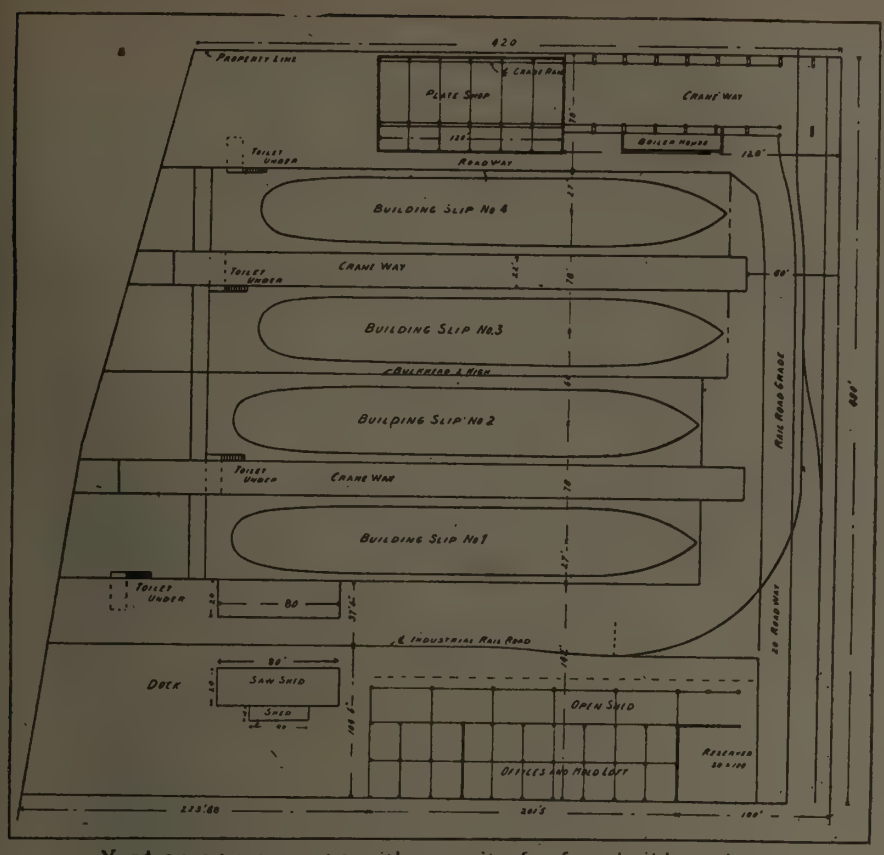
In modern wooden vessels built on the coasts of the United States, considerable use is made of edge-bolting to fasten the various keel and keelson elements and the strakes of ceiling together. Edge bolting means fastening the pieces together longitudinally. In other words, the ceiling strakes are bolted through and through to each other, as well as being bolted to the frame timbers. There is no doubt that this form of fastening adds greatly to the strength of the hull structure, particularly in a longitudinal direction, offering resistance to hogging strains. In fact, some experts go so far as to say that the edge-bolting is all that prevents the largest of wooden ships from breaking-up in a seaway. This is probably an exaggeration, although it has been demonstrated that timbers well edge-bolted at least approximate the strength of single pieces of the size of the members so combined.

Plan and Equipment of the Shipyard

Before the actual work of building the ship can commence, the shipyard must be planned and equipped. If the builder is going into the construction of wooden ships on a permanent basis, this problem is perhaps the most important one he will be called upon to solve. Mistakes in the design or method of building a given hull can be rectified when the next ship is laid down, but blunders in the layout of equipment of the shipyard can seldom be corrected, except at prohibitive expense. The shipbuilder who starts out with a half-baked, poorly laid out, pinched and skimped plant, is saddling himself with a handicap that may later spell ruin. The impression is all too prevalent that a well planned, thoroughly equipped plant, carefully arranged and organized, is relatively necessary for building wooden ships. Quite the reverse is true, and a study of the plants that have built ships continuously for a generation or more, through good times and bad, reveals the fact that they are all as completely equipped for their task as any steel shipyard. In fact, one of the unfortunate results of the present boom is the multiplication of haywire yards on both eastern and western coasts. If wood shipbuilding is to establish itself permanently, the idea that anybody's back lot will do for a building site, and a chest of carpenter's tools for equipment, must be definitely abandoned.

The location of the yard is the first phase of the problem to be considered. Four factors govern the selection of the site: The supply of labor, the cost of the land, the contour of the ground and the depth of the water. Labor supply and real estate prices are complementary; where labor is abundant, property is expensive, and where land is cheap the supply of labor is dubious. The builder must compromise these conflicting elements to the best of his judgment and ability, remembering that a busy yard may carry a high overhead, but no plant can run without men. It is significant that the most successful of the modern wooden shipbuilding plants on the Pacific Coast are located in or near large cities. This would indicate that labor supply is the controlling factor.

In selecting a site for wooden shipbuilding, the slope and contour of the ground are important. Preferably, the ships should be built on dry land that has just sufficient natural slope to permit the laying of the keel blocks conveniently. There also must be level property for the construction of buildings and the storage of lumber. These conditions are not always easily fulfilled, although they are found in many of the oldest and most successful yards. In some cases, where long tide flats are encountered, filling has been resorted to, and although it is an expensive process an ideal site can be created in this manner. An example of the relative importance of properly preparing the site is found in the estimates for a small California yard, in which the cost of buildings is given as $9,280 and the yard work



Yard on city property with capacity for four building slips.

at $16,520, including $4,720 for filling. In some Pacific Coast yards where natural ground conditions are unfavorable, the building ways, framing stages and even the foundations for buildings and lumber storage have been placed on piles. On fresh-water rivers, safe from the ravages of the toredo, this procedure is not so objectionable as on salt water, but under all circumstances it is subject to criticism on account of being temporary and a source of continual expense for renewals. This practice can be defended only in cases where the builder feels his business is so purely transient that the expense of filling-in permanent foundation or paying enough for a suitable natural site, is unjustified.

In many wooden shipyards too little consideration has been given the influence of the shape of the property on the progress of the material through the plant. Many yards, especially some of the newer ones, are laid out with no thought whatever, apparently, to the labor that might be saved by properly and thoughtfully routing the work. The principles of straight-line progress that are so ingrained in the metal working industries and most other productive establishments, have been completely overlooked. The result is chaos and a tremendous waste of money. This comes from the practice of throwing the yards together rather than having them designed by a competent, experienced engineer.

If routing alone is to be considered, a long, narrow yard, in which the raw material comes in at one end and proceeds in a straight line to the building ways at the other, is ideal. This arrangement can seldom be realized, and the next choice is a rectangular yard in which the material flows around only one corner and does not double back at any point. Regardless of the shape of the plot, however, and the limitations of property lines, a skilled designer can so arrange the equipment as to get the most out of the situation at hand and avoid waste in handling materials.

The accompanying illustrations show some of the principles of yard arrangement. One shows a small yard for three ships. In this case, a long, narrow piece of ground was available and a straight line plant was the result. Another illustration shows what can be done with a comparatively shallow, irregular plot on which a large number of building slips must be placed. In this case, extra room and proper routing is obtained by placing the slips at an acute angle with the harbor line. The advantages of angular layouts of this general character have long been understood by industrial engineers.

Getting the Most Out of City Property

A third illustration shows what can be done on comparatively restricted ground area in the heart of a city. In this case, four building slips for ships of the largest size are provided, together with ample room for shops of a more elaborate character than are usually found around wooden shipbuilding plants, yet the plant is not overcrowded. The lumber moves across the yard from south to north and is properly distributed by means of the travelling cranes between the first and second and third and fourth slips. The steel fittings, which are made up in the plant shop, move in the opposite direction.

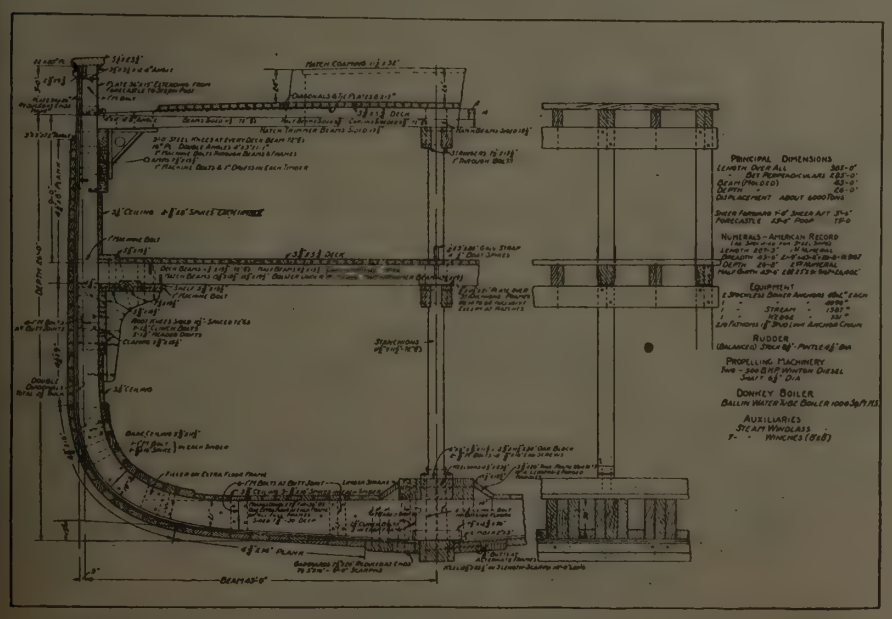
The cost of wooden shipyards varies, of course, within wide limits, depending on the locality, price of the ground, number of building slips and the completeness of the shop and yard equipment. In altogether too many cases the latter item is dangerously slighted. Probably $45,000 represents the minimum for three slips, and in this case the margin is hardly comfortable. From this figure, the investment ranges up to $500,000. While no definite suggestions can be given where so many variables are to be considered, it is safe to say that a reasonable sum invested in the plant and its equipment makes for permanent success.

The question of protecting the building slips with sheds is a moot one. There is no doubt the protection of the work from the weather during construction tends to add to the life of the vessel, and that from the standpoint of the comfort of the workmen and their efficiency, especially in the winter time, sheds are desirable. On the other hand, they add greatly to the cost of the yard, and this is the principal reason why so much work is being done out-of-doors.

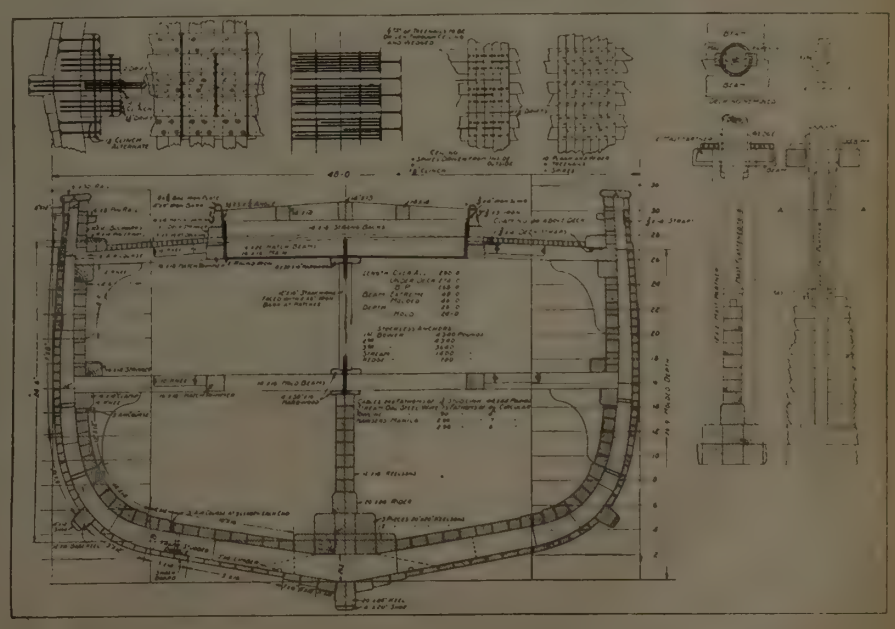
The equipment necessary for economically handling materials, with the tools required for working up timbers, constitute the bulk of the machinery in a wooden shipyard. In many wooden shipyards, as previously suggested, the problem of handling lumber and other materials has been given scant consideration. Too often the traditions of the logging camp and the old-line sawmill have been handed on to the shipyard without any thought of the difference in the problems to be solved.

In the smaller yards, however, where the overhead soon becomes topheavy, simplicity of equipment is permissible. In such cases, a small hoisting engine or two and a few hundred feet of wire rope are about all that are required for handling timbers, supplemented by a few dollies or lumber trucks. The timbers are handled by skidding them from place to place in the conventional lumberman's fashion.

In elaborately equipped yards, and in most cases where thoroughly satisfactory results are desired, some form of crane equipment



Midship section and construction details of 4,000-ton motor ship with diagonal planking.



Midship section and construction details of 290-ft. auxiliary schooner.

is provided. In cases where there are building sheds, rope or electrically driven I-beam monorail hoists running the full length of the shed have been found to fill the bill. Where the work is out in the open, traveling cranes are most frequently employed.

The equipment required for working-up timbers, including the band saws, cut-off saws, jig saws, planing machines, automatic leveling machines, etc., must be carefully arranged so the work can be gotten out expeditiously with a minimum of re-handling. There are two general methods of arranging this equipment. In some yards it is grouped together in a mill located, usually, at a convenient point in front of the building ways. In other yards, the apparatus is scattered among a number of small saw sheds, on the unit principle. In the latter case, each building slip is provided with an individual saw outfit, located, generally, at the head of the ways.

For handling light timbers in single pieces, ordinary lumber dollies and wide-tired four-wheel trucks are used in great profusion in wooden shipyards. These vehicles usually are of the simplest character, consisting of nothing more than a timber frame to which the wheels and axles are bolted. They may be moved by man power, although horses are usually employed. In some of the more progressive yards, small gasoline-driven tractors have been introduced, making it possible to handle the lumber trucks in trains.

Some Standard Designs for Wooden Ship Construction

The problem of overcoming the inherent weakness of wooden ship construction has been the object of close study by a large number of naval architects for a couple of years—ever since the revival in wooden shipbuilding set in earnest. As a result of this intensive effort, a number of somewhat modified designs have been evolved, covering the construction of wooden vessels for deep sea service. The latest designs provide for boats up to 308 feet in length and of 4,000 tons capacity. In some of them steel is employed extensively.

The question of using steel reinforcing in some form to counteract some of the characteristic weaknesses of wooden hulls is a moot one. Some builders, particularly of the older generation, claim it is not practicable to fasten wood and steel members together in a satisfactory manner. It is interesting to observe, however, that practically all of the larger vessels under construction on the Pacific coast at the present time are reinforced with steel in one form or another. If current practice is any guide, it may safely be stated that steel reinforcement is necessary for hulls over 275 feet in length and exceeding, say, 3,500 tons dead weight.

Various types of steel reinforcing are employed. In some cases, this consists simply of deck straps, with steel lined hatch combings. The deck straps usually are nothing more than flats ¾ inch thick and 4 inches wide riveted together at the ends.

The design worked out by Theodore E. Ferris for the standard wooden vessels for the United States Emergency Fleet Corp, provides for a system of diagonal steel strapping. The straps in the United States government boats are ½ x 4 inches in cross section and, of course, extend around and under the turn of the bilge. They are riveted at the top to ¾ to 8 inch steel chord. The straps are arranged in the form of a diagonal lattice and are riveted together where they cross. They are lined up to meet the top chord at every other frame space and are fastened to the frame timbers by 8-inch bolts. It is said this form of strapping for a 281-foot government boat costs $8,000, including $5,000 for labor. Two other forms of steel strapping are in general use on the Pacific Coast at the present time. One style, designed by Mr. R. Ward, general manager, Grays Harbor Ship Building Company, Aberdeen, Wash., consists of two arches of ¾ x 14 inch universal plates let into the sides of the frames and securely bolted in place. The other type, designed by Fred A. Ballin, Supple & Ballin, Portland, Ore., involves the construction of a steel bulwark or topside over the upper ends of the frame timbers. The steel topside construction is riveted to a deck stringer plate of suitable dimensions.

Modern designers, however, do not depend entirely on steel reinforcing for strengthening naturally weak wooden hulls. In the newer types of ships, the general arrangement of the hull structure has been materially modified and the distribution of timbers radically altered. The details of three types of modern Pacific Coast construction are shown in the accompanying cross-sections.

One of the illustrations shows the midship section of the standard 5-masted auxiliary schooner. A number of these vessels have been built. They are of the following dimensions: Length over all, 290 feet; length under deck, 274 feet; length between perpendiculars, 268 feet; beam, extreme, 48 feet; beam molded, 46 feet 10 inches; depth, molded, 26 feet 9 inches; depth of hold, 24 ft. 6 ins. They are equipped with twin screws driven by 400 horsepower, 4-cylinder, crosshead type, 2-cycle oil engines. A study of their cross section indicates that in their general design these vessels are similar to the standard Pacific Coast type, except that they are strengthened by means of a heavy center girder keelson and by steel arch strapping on the sides.

The keelson construction is one of the features of these vessels. The main keelson structure consists of five 20 x 20-inch pieces laid on the floors, surmounted by three 20 x 20-inch sister keelsons and a 20 x 24-inch rider. In addition, and this is where the construction differs from ordinary practice, there are eight 12 x 18-inch keelsons laid on top of the rider keelson. These latter keelsons form a sort of center girder. They are arranged in the shape of an arch, extending up to the height of the hold beams amidship and tapering down on both ends.

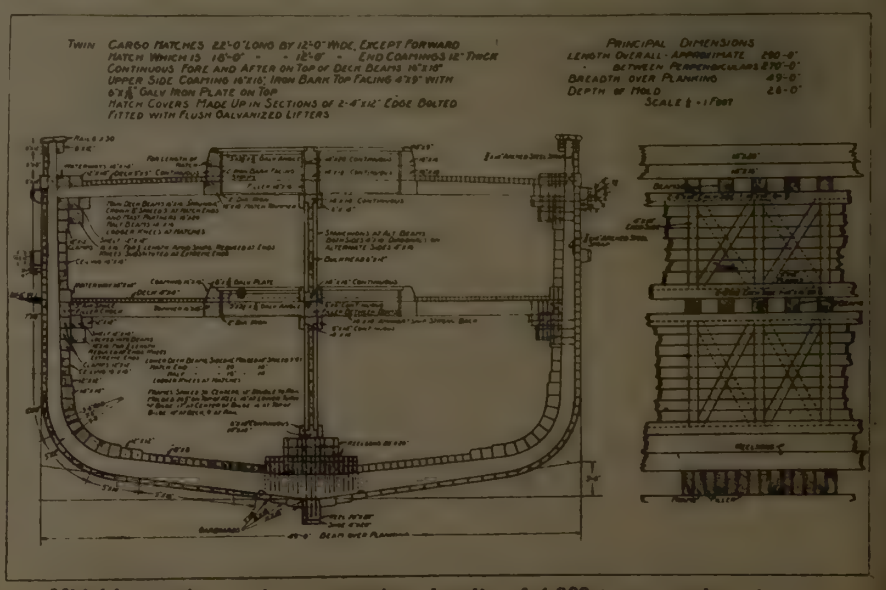
The cross section details of a 4,000-ton wooden steamer form an interesting contrast to the motor ship. This vessel is 290 feet in length over all, 270 feet between perpendiculars, 49 feet beam over the planking, with a depth of hold of 26 feet. The keelson construction in this case consists of five 20 x 20-inch keelsons laid on the floors surmounted by three 20 x 20-inch sister keelsons and a 14 x 14-inch continuous rider. On either side of the rider are 6 x 14-inch stringers. Instead of the center girder-keelson a central longitudinal bulkhead is employed. It consists of stanchions at alternate beams connected by a bulkhead built up of 6 x 12-inch timbers. These timbers are further strengthened by 4 x 10-inch diagonals on both sides.

The use of knees for holding the beams in place has been obviated by the employment of a clamp and shelf type of construction. The clamp consists of three 12 x 12-inch pieces surmounted by the shelf which is built up of a 12 x 14-inch, 12 x 12-inch and 16 x 16-inch stringers. This shelf construction is used for supporting both the lower and upper deck beams.

The other cross section gives details of a 4,000-ton motor ship designed by Fred A. Ballin, Supple & Ballin, Portland, Ore. The construction adopted presents several novel features, the object being to produce a boat which will have strength equivalent to that of a steel hull without using excessive amounts of timber. To accomplish this purpose, unusually deep floors are employed, together with a double diagonal inner skin of planking and specially designed steel topsides. The boat, which has a displacement of about 6,000 tons, and a capacity of about 4,000 tons, is 308 feet in length over all and 285 feet between perpendiculars. The molded beam is 43 feet and the molded depth 26 feet. The sheer forward is 7 feet; aft, 3 feet 6 inches. This vessel is driven by two 500-horsepower, 6-cylinder Winton engines, built by the Winton Gas Engine Works, Cleveland. These engines are connected to twin screws.

Weights of Materials Used

It is necessary when building a wooden ship to work out the weights of the various items in the structure carefully. The following table will give an idea of what these figures come to in the case of an actual ship. The figures given below are the hull weights of a motor schooner built by the Aberdeen Shipbuilding Company, Aberdeen, Wash., for the French-American Shipping Company, New York. These boats are 252 feet in length over all and 221 feet between perpendiculars. The length of the keel is 220 feet. The extreme beam is



Midship section and construction details of 4,000 tons wooden steamer.

Scaffolding arranged alongside keel blocks.

Resawing frame joint to a proper fit.

43 feet, the molded beam 40 feet 2 inches, and the depth of hold is 21 feet. The hull weights are as follows:

Item	Pounds
Oakum	8,000
Auxiliaries	8,000
Anchors and chains	38,350
Boats	2,000
Cabin and forecastle fittings	10,000
Davits	2,000
Deck piping and pumps	3,000
Donkey boiler	8,000
Engine room piping, air bottles, lead sleeve	4,000
Exhaust piping	2,200
Fastenings	266,000
Fresh water	58,156
Lumber	3,166,350
Main engines	56,000
Oil	270,000
Propellers	4,000
Rigging	20,000
Spars	49,200
Shafting	10,000
Steering gear	1,000
Strut	4,000
Tanks	26,000
Windlass	16,000
Winches, 3	30,000
Spikes	40,000
Clinch rings	2,500
Iron bark	30,000
Paint	70,000
Total	4,206,756

An interesting formula for estimating the carrying capacity of wooden ships of the standard Pacific Coast type with heavy center keelsons has been worked out by western engineers. This formula is as follows:—

C equals 1.15 L. W.

Where C. is the carrying capacity in pounds L is the number of board feet of lumber required to build ship.

W is the weight of the timber per board foot.

If actual experience is any guide, it requires from seven to nine months to build a wooden vessel on the Pacific Coast under existing conditions. Claims have been made that 3,500-ton boats could be built in four months, but in no case under the writer's observation has this been substantiated, even approximately. It is the writer's judgment that with the proper yard organization and care in assembling materials promptly, these boats might be constructed in five or six months at the minimum.

While it is possible to crowd the construction by adding more men to the job, the point is soon reached where additional men do not result in proportionately increased progress. One of the oldest practical ship builders on the Pacific Coast claims that it is not economical to work over 50 to 60 men on one hull. About 25 per cent. of these men should be skilled.

Information on Construction of Frames and Keel Laying

Laying the keel is popularly supposed to be the first step in the construction of any vessel, be it wood or steel. As a matter of fact, it is not the first operation to be performed. Before the keel can be laid, the ways must be prepared and the keel blocks assembled in their proper position. The first step, therefore, in actually building a wooden ship, consists in preparing the ways or foundation for the keel blocks. In European shipyards, the building slips or ways frequently are paved with stone in order to insure a permanently smooth, true surface. In such cases large blocks of wood are let into the masonry and the keel blocks, shores, etc., where necessary, are bolted or spiked to these blocks.

In American yards it is not considered necessary to pave the building slips. In fact, in most wooden shipyards, the amount of work involved in preparing the ways is comparatively slight. If solid ground is available on which the blocks may be laid, it is simply necessary to grade the site to a comparatively true surface. It is, of course, better in such cases if the ground slopes properly. If the ground has no slope it is necessary to build the blocks up rather high under the forward end of the vessel in order to give the proper declivity to the launching ways.

If the ground is sufficiently solid, the keel blocks can be laid directly on the earth, which in some cases may be tamped a trifle. If the ground is soft or if it has been recently filled, piles must be driven to support the weight of the ship under construction. In some cases, particularly on the Pacific Coast, as previously mentioned, the entire building slip rests on piles which may be driven out over the water to a considerable distance. In cases where this is done in salt water, more or less frequent repairs will have to be made to the foundation. It is better, therefore, where possible, to lay the keel blocks on dry land.

Arrangement of Keel Blocks

The keel block structure consists of blocks about 16 inches square and 6 to 8 feet in length, piled between 2 x 12-inch planks which run parallel to the keel. From two to three planks are placed between each layer of blocks. The planks give the structure what little longitudinal stability it needs.

The blocks are laid to the proper declivity by stretching a cord between fixed points, the correct height of which have been determined either by direct measurement or means of a civil engineer's level. Most authorities state that the keel blocks should be laid to a declivity of ⅝ inch per foot. On the Pacific Coast, in most cases it has been found this is not enough to get the vessel properly started down the ways. In one case it took 20 men half a day to get the ship started after the launching should have taken place. Most western ship builders today are laying their blocks to a grade of ¾ inch or 1 inch per foot.

It should be remembered that when the ship is launched her after part is raised by the bouyancy of the water and if proper care is not taken in arranging the declivity of the keel blocks, the forefoot may touch the ground when the ship has reached the end of the ways. In some cases, to prevent this it has been found necessary to excavate or dredge the lower end of the slip after the vessel is finished.

In preparing the building slip, therefore, there are three important considerations to be kept in mind. They are as follows:

1.—To provide sufficient space between the ship and the ground

for performing all the building operations at the keel and bilges.

2.—To leave sufficient space between the ground and bilges, and one-sixth the breadth of the ship at each side of the keel for fitting the ground ways, and for driving in the wedges which tighten the cradle under the ship, so as to support her after the shores and blocks are knocked away.

3.—To make such an allowance for the excess, if any, in the declivity of the launching ways, over that of the blocks as will prevent the forefoot of the ship from touching the ground when she has reached the end of the ways, as previously explained.

In order to obtain the required height of the foremost block with great accuracy a sketch of the ground or slip upon which the ship is to be built should be made in elevation and section, and two pieces of cardboard should be cut, one to the shape of the transverse and the other to the longitudinal section of the ship, both drawings and cardboards being on the same scale. By placing the cards on the sketches and trying them in various positions, all risk of error in deciding the height of the foremast blocks can be avoided.

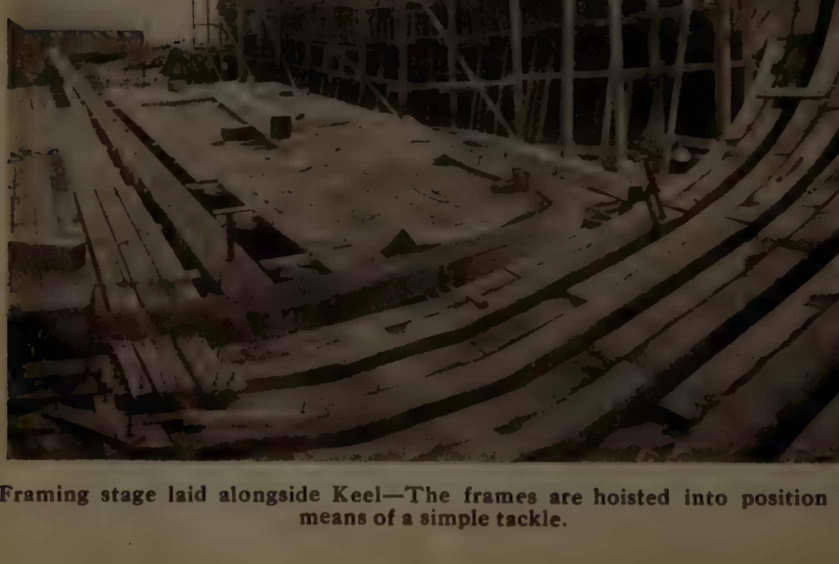
The launching ways usually are set at a greater declivity than the keel blocks and the amount that the forefoot of the ship falls below the line of the blocks when it reaches the lowest part of the slip can be found by a simple mathematical calculation. Clearance between the forefoot and the ground should not be less than 9 to 12 inches. Now in the case of a ship built on a slip 300 feet long, on blocks at an inclination of ⅝ inch to a foot, and launched at ¾ inch to a foot, it is evident that the bow falls ⅛ inch below the line of the blocks for every foot the ship slides down the ways. Hence, in the 300 feet, there is a total relative fall of 37½ inches, and therefore, the foremost block, if at the head of the slip, must be kept 37½ inches plus 12 inches, or 49½ inches above a line, which at an inclination of ⅝ inch to the foot just touches the after end of the ship.

From these data the foremost block can be readily built to its correct height. In order to lay the other blocks, instead of using the string or cord previously mentioned, a declivity batten may be prepared. This is a batten about 20 feet long, the edges of which are straight and inclined to each other at an angle equal to the required declivity of the blocks. Now put up a block at 20 feet abaft the foremost one to such a height as will cause the upper edge of the batten to be level, while the lower edge rests upon the two blocks. These two blocks will now have the proper declivity with reference to each other.

The other blocks are laid in a similar manner, or by sighting them with the two first placed, and when this is done they can be proved by stretching the line along their upper surfaces or by trying the declivity batten along the whole range of blocks.

After the blocks are laid out, in some yards they are secured to the ground by nails, dogs, etc., and if necessary, to each other. Spur shores also are recommended, reaching from the foreside of each block near the ground to the upper part of the after side of the one in front of it, in order to prevent the blocks from tripping, a casualty which has at times occurred when such precautions have not been taken.

The keel rests on short blocks about 10 inches thick which are supported on wedges. These wedges serve a double purpose. They make it easy to bring the blocks exactly up to the line so that each pier supports its proper proportion of the weight and in addition, when the ship is to be launched they may be readily knocked out of position with a sledge. After the site is prepared, the work of arranging the keel blocks and the preparations for laying the keel should take less than a week. The actual laying of the keel for à 300-foot boat can be accomplished in a day or two. In some yards, the blocks are piled up crib fashion.



Framing stage laid alongside Keel—The frames are hoisted into position by means of a simple tackle.

Upper part of Arch Strappi

Getting Out the Keel

The keel is made of long pieces of selected timber. On the Pacific Coast these pieces can easily be obtained in lengths up to 100 feet. These extra long lengths, of course, reduce the number of joints or scarfs. In order to preserve their continuity as much as possible, the various sections of the keel are scarfed together. These scarfs may be from 10 to 20 feet in length. The two pieces, of course, are thoroughly bolted together at the scarf. The joints of the scarf frequently are laid in carbolineum to prevent decay and also to resist the action of the sea animalculae. As soon as the keel is laid, its alignment is secured against disturbance by means of sway braces spaced every 30 or 40 feet.

After the keel pieces are laid on the blocks and fitted together, the whole is sighted and proved to be straight. When this is accomplished, the keel is secured in the correct position by driving short treenails to the blocks close against the side of the keel. All of the bolts are now driven through the keel scarfs. The positions of the frame stations are next transferred to the keel, after which it is ready to receive the frames and to be joined to the stem and stern posts.

In order to prevent any water which may find its way into the joints of the keel scarfs from getting behind the garboards, a stopwater may be placed in the joint of the scarf. This stopwater consists simply of a plug of soft pine driven tightly into a hole bored right through the joint. The expansion of the plug, when immersed, prevents water from going up through the scarf and getting behind the bottom planking.

The framing is one of the most important parts of the ship's structure, which consists, essentially of nothing more than a series of transverse ribs covered with a longitudinal series of planks which bind the frames together and keep out the water. The frames usually are spaced at equidistant intervals, the length of which is known as a "room and space." The length of the room and space is fixed by the designer. On account of the great curvature of the transverse sections of the vessel, especially amidships, it is necessary to build the frames of a number of pieces and in order that these may be united as rigidly as possible, they are disposed in two sets, the butts of which give shift to each other, the whole being so combined that its elements will yield mutual supports in the most efficient manner obtainable.

Preparing the Molds

The proper curves or molds for the frame sections are provided by the mold loft, where the sheer-draft or lines of the vessel are laid down full size. The mold loft should be big enough so the longitudinal or sheer-plan of the vessel can be laid down in at least two sections. In many cases, however, it is necessary to lay down the ship in three sections.

A sheer-draft, as the lines of the vessel frequently are called, usually is prepared in the drawing room to a scale of ¼ inch to the foot. When this is copied to full size on the mold-loft floor, it may be found that errors, almost inappreciable in the quarter scale drawings are very apparent when magnified 48 times,. It is usually found, therefore, that the three sets of lines, namely, the sheer-plan, body-plan, and half-breadth plan, disagree sufficiently to prevent the various problems of laying off from being solved with that degree of accuracy which is necessary in order to obtain a fair surface to the vessel. Hence a fairing or correcting process has to be performed before the molds can be prepared.

As every draughtsman knows, the projections of the lines of the vessel upon the three plans, sheer, body and half-breadth, are mutually

interdependent and this property is utilized in performing the fairing operation. The projections of each of the sets of lines used in this process, that is, the waterlines or level lines, cross sections or square sections, bow lines and diagonal lines, appear straight in one or two of the three plans, so that by the aid of a straightedge they can be drawn fair easily in such plans. Now the property which a wooden or metallic batten has of bending in a fair curve is brought into play in drawing the lines fairly in the plans where they appeared curved. Since the intersections of lines with each other are points, the points of intersection of two sets of lines in one plan are transferred to their relative positions in the others, so that points which appear straight in one plan form a curved line in another. Battens are penned or bent to pass through as many of the points as is consistent with absolute fairness and the line is drawn. Thus, by a series of interchanges between the three plans, or projections of the lines, the various lines are copied from one plan into another until at length all the plans coincide and the lines composing them are continuous curves. The fact that the curves are continuous proves that the body is fair.

It is a great advantage if the seams of the boards forming the floor of the mold loft are perfectly straight and parallel, as they thus afford considerable assistance in the several processes of squaring and drawing parallel lines which are involved in the practice of laying-off.

Time Required for Framing

Mold loft floors usually are painted. Generally a gray color is chosen. When a new set of lines is to be laid down it usually is advisable to repaint the floor in order to completely obliterate all of the old lines. In some cases, however, the floors are not painted, but are left in a natural color. In these yards when new lines are to be laid down, the whole floor is gone over with a cabinet scraper, thus removing the old drawing. White pine, cedar, or other easily worked strips are used for making molds.

As soon as the molds are ready, the process of framing the ship actually may be begun. This process may be divided into three steps as follows: Sawing the frame sections; assembling the sections, or buttocks; and raising the frame.

The time required to frame a ship seems to vary widely in different yards. In one case the writer has been informed that 46 days were required to frame a 250-foot, 4-masted schooner. In this yard the frames were skidded into position and raised by tackle, no cranes being available. In another yard only 15 days were required to frame the square body of a 290-foot ship, using the same method of raising the frames. A gang of about eight to ten men is required, not including those working on the framing stage where a dozen more are necessary. After the main frames are up the smaller pieces of the stearn frame, including the transom, etc., can be framed with a gang of four or five men.

Specifications of Timber Needed

The sizes of timbers necessary and the quantity required for framing a 300-foot vessel are indicated by the following quotation from the timber schedule for standard Pacific Coast type wooden steamship, designed by Mr. Ferris for the United States Emergency Fleet Corp. The standard United States government boat, it will be recalled, is 281 ft. 6 ins. in length overall and 46 ft. beam. It has a cargo capacity of about 3,500 tons on a draft of 23½ feet. The frame timber specifications are as follows:

Net size	Gross size	Length	No. of pieces	Feet B.M.
12 x 32	12¼ x 32	10	100	32,667
12 x 30	12¼ x 30	10	16	4,900
12 x 30	12¼ x 30	10	100	30,625
12 x 30	12¼ x 30	16	12	5,880
12 x 30	12¼ x 30	20	16	9,800
12 x 30	12¼ x 30	24	12	8,820
12 x 28	12¼ x 28	12	16	5,488
12 x 28	12¼ x 28	16	50	22,867
12 x 28	12¼ x 28	16	56	25,611
12 x 26	12¼ x 26	10	100	26,541
12 x 26	12¼ x 26	16	56	23,781
12 x 26	12¼ x 26	16	50	21,233
12 x 26	12¼ x 26	28	20	14,863
12 x 26	12¼ x 26	28	16	11,891
12 x 26	12¼ x 26	30	80	63,700
12 x 24	12¼ x 24	16	56	21,952
12 x 24	12¼ x 24	16	50	19,600
12 x 24	12¼ x 24	16*	5	2,940
12 x 20	12¼ x 20	12	50	12,250
12 x 20	12¼ x 20	16	56	18,293
12 x 16	12¼ x 16	12	56	10,976
12 x 16	12¼ x 16	12	50	9,800
12 x 16	12¼ x 16	14	80	18,293
12 x 12	12¼ x 12	16	80	15,680
10 x 24	10¼ x 24	16*	5	2,400

*And up, average 24 feet.

Shipbuilding at Moss Glen, N. B.

The first wooden vessel to be launched in a number of years in the vicinity of St. John, N.B., is the three-masted schooner built at the village of Moss Glen, on the Kennebecasis River, once famous for its wooden shipyards. This schooner is one of the first vessels that was started during the present revival of the industry around St. John. The keel was laid in February of this year. The frame was finished by the end of July and the work of planking followed, and was completed without delay. The keel of the vessels is 136 feet long, and the schooner measures 155 feet from stem to stern. Her tonnage is approximately 400 tons, and she has a carrying capacity of 800 tons.

The vessel was built by Peter McIntyre, the well-known ship broker of St. John, N.B., and his son, Allen A. McIntyre. The cost of the vessel was $35,000. All of the lumber used was taken from the hills of Moss Glen, within a few miles of the scene of construction.

The shipbuilding plant at Moss Glen covers an area of about three acres, and a large sawmill is located at the back of the village, a short distance away. Moss Glen, about fifteen miles from St. John city, is a small village, and in the seventies of the last century was famous for its shipyards, from which many famous vessels were launched.

The wood used in the vessel was chiefly birch, spruce, and small quantities of hard pine. It is interesting to note that in the construction of this vessel the curves in the frame timbers were secured from natural curves in the growth of the timber. This method of shipbuilding produces great strength in the frame. The keel of the vessel required sticks 22 x 24 in. at the butt and not less than 17 in. 35 ft. from the butt.

It is reported that the McKean Shipbuilding Company, St. John, N.B., will establish a yard at Dartmouth, N.S., and that they are also interested in a shipbuilding plant now in operation at Liverpool, N.S. The new plant is expected to operate upon the construction of wooden sailing vessels.

The Sawmill That Made B.C. Fir Famous

Hastings Sawmill, Vancouver, Has Been Manufacturing and Exporting Continuously for Over Half a Century—History of the Company and Its Extensive Operations

The British Columbia Mills, Timber & Trading Company, proprietors of the Hastings Saw Mill, the oldest established sawmill in the province, have the proud distinction of being the largest exporters of lumber in Western Canada, over fifty per cent. of the total quantity exported being credited to it. The existence of its business dates from the year 1865, about the time when lumbering was first started in British Columbia, and it has had an unbroken record of activity ever since. The title of the firm has undergone one or two changes, but since 1889—when the businesses of the Royal City Planing Mills, Vancouver and New Westminster, and the Hastings Saw Mill, were amalgamated, and some years later the Moodyville Sawmill was purchased, with the late Mr. John Hendry as president and general manager of the company, which dual office he held until his death—in 1916—it has been the same as it is now. The present mill itself, however, has always been known by the name of the Hastings Saw Mill, and its history is closely associated with that of the development of the lumber industry of the province.

The business of the company has been a success since its inception in spite of the fluctuations of trade and the financial depressions sometimes felt by the community. This success may very largely be attributed to the strict business methods employed, careful management, and the quality of the lumber product turned out. From the very first the company set itself out to maintain the very highest standard in the manufacture of its products, from which ideal it has never departed; and while continually improving its plant and adopting everything in the way of improved machinery that it deemed wise, it has carefully avoided installing anything at the expense of "good manufacture."

The plant occupies an ideal situation on the south shore of Vancouver harbor, known as Burrard Inlet, the site having been practically the first site chosen on the Inlet. It has been completely rebuilt and modernized several times, and its output has increased from a mere few thousand feet per day to 250,000 feet per day of ten hours, which output can be increased under pressure. Vessels of the largest size can lie alongside its wharves, and it is no uncommon sight to see two or three vessels loading at the same time, while there have been as many as nine loading at once. Altogether the company gives employment to one thousand men.

Timber Supply

The company's timber holdings, which are located both on the mainland and on Vancouver Island, are among the most extensive and the very finest in the country. As the company was early in the field, its holdings were among the very first selections made. The plant was not built for to-day or to-morrow, but with a view to sawing lumber

Illustration shows ships at wharf of the Hastings Saw Mill, Vancouver, B.C.

long after the present generation of lumbermen have ceased to exist. About 55 per cent. of the timber is Douglas fir; 22 per cent. Western red cedar; 10 per cent. Western hemlock; 8 per cent. Sitka spruce; and the remaining 5 per cent. mostly white pine with some yellow cedar.

The accompanying illustrations show trees of Douglas fir and Western red cedar of average size and quality.

Logging Camps

The camps at present are five in number, four of them being situated on the holdings near Rock Bay, Vancouver Island, and the other on Thurlow Island, some three miles distant from Rock Bay, which is within easy towing distance of the mill in Vancouver. The timber is easily accessible, and the land is not rough. The actual logging is being done some twenty miles inland; so that the logs have to be transported by rail to tidewater. The railway, which is of standard gauge and owned and operated by the company, is extended as necessity requires; but owing to the fact that the stands of timber have been so heavy and to the fact that the country abounds in lakes, it

The landing and railway terminus at Rock Bay, V.I., showing the company's hotel (foreground on the left), store (right), and hospital (extreme left)

has not been necessary to extend it more than once during the last three or four years.

The actual location of the camps is as follows: The first camp reached on the railway is the operating camp, which is some fifteen miles distant from tidewater at Rock Bay, and from this camp the line extends another five miles to Roberts Lake, From the operating camp a logging spur, extending a distance of four miles into the holdings, branches off; and about two miles farther along the line another logging spur runs to McNair's Lake, a distance of a mile. On Roberts Lake are two more camps which are located on the side opposite the terminus of the railway. The logs from these camps are dumped into the lake and towed to the railway landing, where they are loaded on to the cars.

The logging equipment is most complete. There are six locomotives of the straight connected type, with seventy logging cars and some thirty donkey engines. At the operating camp there are a large and completely equipped machine shop and locomotive sheds. The trees are felled and bucked in the regular Pacific Coast way, and the logs are yarded and loaded by donkey engines. On arrival of the train at tidewater all the logs are dumped in one operation, which is done by means of a system of cables attached to and operated by the locomotive. Altogether nearly 500 men are employed in the camps and on the railway, of which P. DesBrisay is the resident superintendent.

The company logs also on some of its other holdings, but this logging is done by contract.

Camp Employees

The company knows the value of satisfied employees, hence it sees that the camp employees are provided with comfortable quarters and plenty of nourishing food. The accompanying view shows the company's hotel, store and hospital at Rock Bay. The hospital, which is seen to the extreme left of the view, beyond which are the cottages for various employees, is in charge of a resident medical man, and is equipped with the most modern appliances. There are also a school and a reading room, and religious services are conducted at regular intervals by the Columbia Coast Mission.

Main Mill

The main mill, which is 500 feet by 80 feet, is equipped with a double breakdown 60 inch circular saw, a 10 ft. band mill with 14 inch breakdown saw; and two band resaws, one 9 ft. and the other 8 ft., both with 12 in. saws. The logs are hauled up from the pond on a single log slip, thrown either way and placed on the log deck by a double steam kicker; then rolled on to the carriages, which will take a log up to 116 feet in length, by steam niggers.

After passing the edgers, which are three in number, and the trimmers, the lumber passes farther along on live rolls to be sorted and graded; and then to be distributed to the different departments or to the ocean shipping sheds or wharves on electric railway or motor trucks.

The masts, spars and heavy timbers for immediate shipment pass on live rolls to a point farther along, where they are loaded on to the railway cars by means of a gravity loading deck.

Planing Mill

The planing mill, which has a capacity of 150,000 feet board measure per day of ten hours, is located in a building 200 feet by 100 feet. Its equipment consists of the following machines, namely: one Berlin timber sizer 16 x 30; one Woods 6 x 12; three Berlins 6 x 9 and 6 x 15, all fast speed; one Berlin 6 x 30; one MacGregor Gourlay 6 x 15; one Berlin sticker 6 x 12; one Woods sticker 6 x 15; one Berlin sander 6 x 30; and necessary resaws and trimmers.

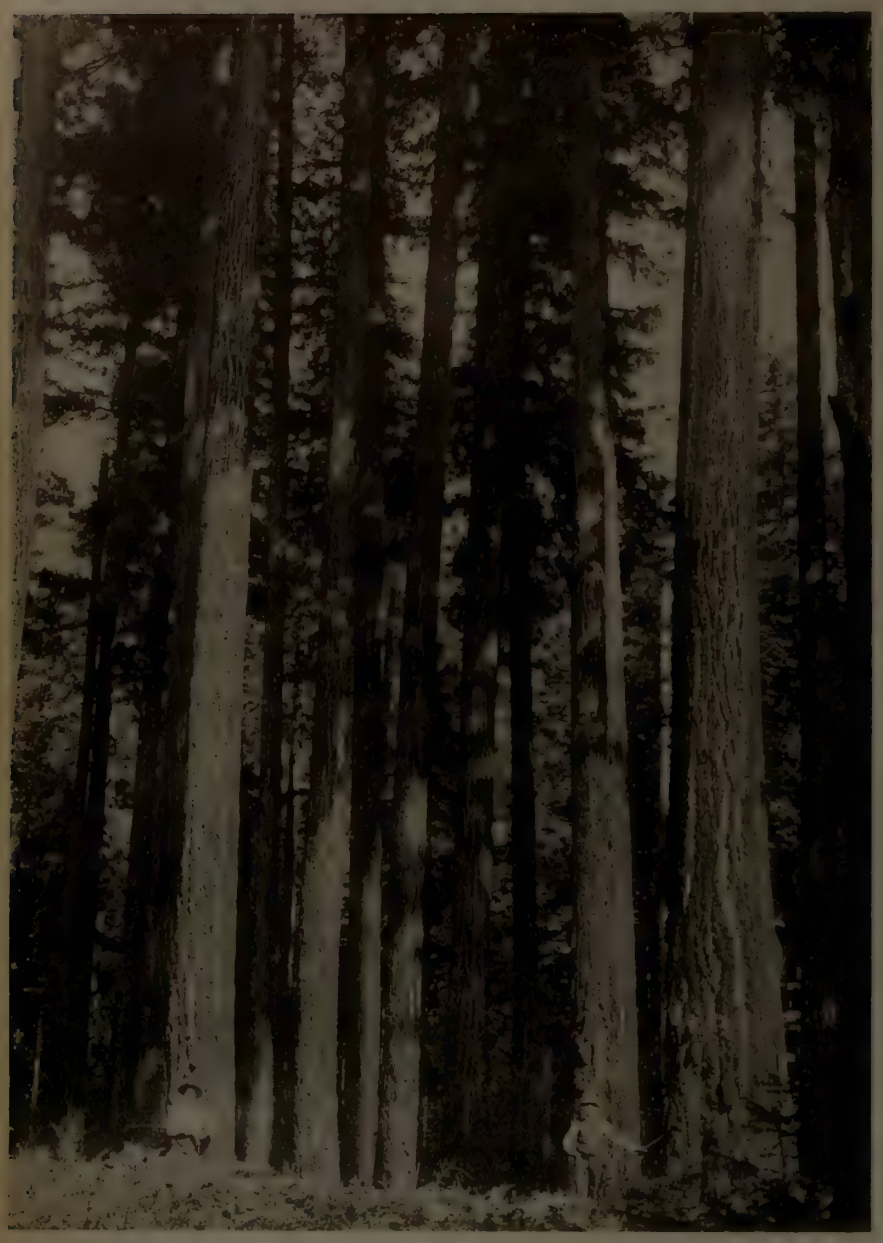
Western Red Cedar seven feet in diameter and 150 feet high

Dry Kilns

A manufacturer may have some of the finest timber to draw from, but he may destroy its qualities through improper drying. The drying process is one that requires an accurate observation and a long experience to perfect. That explains the rea-

Trainload of logs, some over 100 feet long, on the log dump at tidewater, Rock Bay

Trainload of logs on the railway, en route to tidewater



Douglas Fir—The larger trees are from five to seven feet in diameter and from 120 to 150 feet to the first limb—Ideal for ship timbers

son why different manufacturers with the same kind of kiln often obtain very different results. The British Columbia Mills, Timber & Trading Company pays particular attention to the drying of its lumber. It believes that the drying process should be gradual, so that the wood can adapt itself naturally to the change without warping or disrupting the fibre. With the type of kiln in use, which was designed and built by the company, and with an experience covering several decades, it is able to obtain very satisfactory results.

The capacity of the kilns is 150,000 feet board measure per day of ten hours.

Power House

The power for running the plant is generated in 17 boilers of about 3,000 working horse power, and transmitted to the planing mill by a Hamilton twin valve type of engine 14 x 18 in size, of 250 horse power; and to the sawmill by the following Hamilton balance valve type of engines, namely: one twin 20 x 24 in size, 500 horse power, and two singles 24 x 30 of 500 horse power each, and by the necessary small engines for driving the conveyors. In addition to supplying the sawmill, power is also supplied for the electric railway and lighting system; and live steam is furnished for the dry kilns.

Sawdust is exclusively used for fuel, which is fed to the furnaces by automatic feeders.

Other Parts of the Plant

The capacity of the lath mill is between 45,000 and 50,000 lath per day of ten hours. Pickets, broom handles and shingle bands are also manufactured.

The mill is also equipped with hog machinery for cutting up the refuse in case of shortage of fuel; and the plant is equipped throughout with complete blower and conveyor systems.

The equipment of the machine shop consists of three Bertram lathes 24 in., 20 in. and 12 in. in size; planer, shaper, pipe machine, and necessary drills, bolt cutters and tools.

The filing room, which is located above the mill, directly over the sawing units, is one of the largest and most completely equipped filing rooms in the country. The main equipment consists of three Covel machines, which will take 20 in., 16 in. and 13 in. saws respectively.

Yard and Stocks

The company has spacious and well ventilated storage sheds that are conveniently arranged for ready access to stock. The main storage shed for dressed and finished lumber is 300 feet by 60 feet; and the main ocean storage shed is 200 by 150 feet. A feature of the plant is the large amount of wharf space for the huge long Douglas fir timbers for ocean shipment, the large proportion of which are from 65 to 110 feet long, some of them longer.

Recently the company had 3,500,000 feet board measure of such timbers awaiting shipment to Great Britain, the actual shipment being over 4,500,000 feet by one steamer. The accompanying illustration shows this vessel loading these long timbers.

In ordinary times the company has large stocks of rough and dressed Douglas fir, Western red cedar, Western hemlock and spruce lumber, but owing to the unprecedented demand its stocks are comparatively low at present.

Fire Protection System

The fire protection system is modern to the last feature. A complete sprinkler system served by water from the city mains is installed throughout the plant, and there are also many hydrants connected to the mains, placed at suitable points in the yard, and lengths of hose in the mill attached and ready for immediate use. There is also a 50,000 gallon water tank placed at a height of 84 feet, and connected to the sprinkler system, for use in case of an emergency.

The purchasing of supplies, and of provisions for the logging camps and tug boats, is a large and important part of the company's business. It is entrusted to a separate department, which is in charge of Mr. W. F. Frame. A large and well stocked store is run in connection with it, which is patronized not only by the employees, but by outside families. It is interesting to note that the Hastings Mill Store was the first store in what is now Vancouver.

Transportation Facilities

In the early days there was no railway communication with the interior, consequently practically the whole of the output of the mill was exported overseas; hence it is that for over half a century the mark H. S. M. on masts, spars and timbers of Douglas fir has been known in ports the world over, and has been recognized to stand for the highest quality. It was not until the year 1886 that it was possible to communicate by rail with the prairies and the east, in which year the Canadian Pacific Railway completed its transcontinental line to Vancouver. Since that time three other railways have made Vancouver their terminus, and the company's products can now be shipped by all rail routes to practically every part of the continent. With wharfage accommodation, therefore, for ships of the largest size, and the line of the Canadian Pacific Railway (which connects with the

Log deck, main mill

Masts 125 ft. long for B. C. ships

other lines), running immediately by the plant, the company has exceptional transportation facilities, which make possible an expeditious and economical method of shipping the lumber, an advantage that enures to the benefit of the company's customers.

Sales and Distribution

The general sales offices of the company are situated at the foot of Dunley Avenue, Vancouver. The following are the managers of the departments:—Foreign sales, A. W. H. Curtis; car sales, T. N. Brown; local and Coast sales, F. Moore.

The company's representatives are the following, viz.: Middle West, H. S. Galbraith Co., Ltd., 612 McIntyre Block, Winnipeg, Man.; the East, Terry & Gordon, Confederation Life Building, Toronto, Ont.; Mason Gordon & Co., Montreal, Que.

The company counts among its customers some of the largest buyers, including the Government of the Dominion of Canada, and governments of various other countries, than whom there are, perhaps, no buyers who are more strict in their specifications and requirements; several of the largest railways, both on this continent and in other parts of the world; and many shipbuilding and mining companies, and harbor boards, who have been supplied with a large proportion of

A fine Douglas fir, diameter 7 ft. 6 in. and 120 ft. to the first limb

their requirements. It makes a specialty of spars and long timbers, and it is a large shipper to all parts of all the higher grades of lumber, flooring, ceiling, and finish of all kinds.

Although the British Columbia Mills, Timber & Trading Company has so large an exporting business, it has always realized the value of the market of the great prairies, in the building up of which it has played so large a part. Millions upon millions of feet of lumber have been shipped to it. Whether it has been lumber for use on the farm, for houses, for bank offices, for railway construction, it has always been one of the first in the field in all districts. The H. S. M. brand has made its impress upon the trade; it is a standard of excellence, consequently consumers know that they get the very best when they buy it.

The following, which appeared in a previous issue of the Western Lumberman, was contained in a report issued by the Dominion Department of Trade and Commerce on the subject of the lumber trade of Canada with foreign countries:

> "This does not mean to say that Canada has done no business with the West Coast of South America. Occasionally shipments do go down, and doubtless these were more

Loading timbers at the mill wharves, the large proportion of them being from 65 to 110 feet long and from 12 x 12 to 24 x 24 inches square. Cargo over 4,000,000 feet board measure. As far as is known this is the largest cargo on any one vessel, shipped by any one mill on the Pacific Coast.

> frequent in the past. One mill, the Hastings, was apparently well known, and importers in Chile and Peru spoke most highly of the treatment they had received from it. This firm seems never to lack orders and is a shining example of the value of a good name in international trade."

The company has many other and similar testimonials from various foreign markets.

Company Offices

The offices are situated in the mill grounds. The building is of the two-storey bungalow type. On the ground floor are the main office, the foreign and car sales offices, the board room, the reception room, and five other rooms all handsomely finished to represent either Douglas fir, Western red cedar, Western hemlock, or Sitka spruce, the principal woods of the province, in their finished state, which visitors are always welcome to inspect. Upstairs are four other rooms, including the draughting and map room, and the offices of the B. C. Mills, Tug and Barge Company, Limited.

The last mentioned company, which is a subsidiary company of the B. C. Mills, Timber and Trading Company, has a fleet of five tugs, two launches, and about a dozen barges and scows. The tugs are used, as has been said, chiefly for the purpose of towing the booms of logs from the company's holdings to the mill ponds in Vancouver. They may also be chartered for towing purposes.

The Executive Personnel

President and general manager, Eric W. Hamber; general superintendent, Arthur J. Hendry; secretary, J. Alex. Hendry; comptroller, Thos. Sanderson.

The operation of any large business enterprise reflects to a large extent the personality of the executive head. He must be able to surround himself with heads of departments who are capable and reliable, and interested in seeing the plans successfully carried out. Such an organization has President E. W. Hamber, who is head of this extensive business.

Mr. Arthur J. Hendry, Mr. J. Alex. Hendry and Mr. Thomas Sanderson, are highly valued and capable officers of the company, of many years' standing. They have a thorough practical knowledge in their respective departments of the work pertaining to the lumber industry, and various other activities of the company.

Cameron Lumber Co., Ltd., Victoria, Decided to Construct Wooden Vessels Against the Advice of "Experts"—Action Brought Prosperity to Lumber Industry.

It probably will interest readers of this journal to learn from an authoritative source the facts connected with the inception of shipbuilding in British Columbia. The story is attractively told in the following report of an address delivered by President J. O. Cameron, of the Cameron Lumber Company, Ltd., Victoria, at the fourth annual meeting of the Pacific Coast Association of Port Authorities, held at Portland, Ore, on Sept. 5 last:

"Since I know nothing of the science or art of ship construction, whether of wood or steel, my remarks will be devoted to the new industry of building wooden ships at my home city, Victoria, British Columbia. By way of preface, I should tell you that for many years I have been engaged in lumber manufacturing. A considerable portion of the output of our mills went overseas, to various markets. If this great war had not happened, with its attendant destruction of ships by mines, raiders, and submarines, I should never have thought of building any sort of ship.

"I do not need to remind you that all trade and commerce was paralyzed for many months after the breaking out of the war, which condition seemed to be particularly hurtful to the lumber business in British Columbia fully a year before signs of a revival of business began to appear. The mills in which I am interested began receiving numerous requests for prices of lumber c.i.f. British, South African, and Australian ports. We soon found, however, that we were in no better position, for the reason that we could not find ships to carry the lumber to its destination.

"After thoroughly considering the whole situation, I decided that our lumber mills were rapidly approaching financial ruin unless some means could be found for transporting a considerable portion of their output to overseas markets. My associates and myself started enquiries to find one or more ships which might be purchased or chartered at reasonable prices. Offers received seemed altogether unreasonable, although time has proven that we refused some great bargains. After failing to secure regular carriers for our products by purchasing or chartering, we began investigating the possibilities of building ships. We were told by naval architects and shipbuilders that wooden ships were not worth considering; that they were expensive to build and poor cargo carriers, etc. We found on the other hand, that to establish a regular shipyard to build steel ships would require the investment of a large amount of capital; and, furthermore, that the steel which would be required for building the ships would be very costly, and that no firm promise for delivery of a definite quantity could be obtained. Therefore, for the two reasons, namely, want of capital to establish the shipyard and inability to contract for the steel, we had to dismiss all ideas of building steel ships. There was nothing further to consider except 'wooden ships' or 'no ships.' The experts said: 'Wooden ships are little better than no ships.' I thought a great deal over the matter, and as I pondered, some of the great outstanding facts of history came to my recollection. I was reminded that the Nina, Pinto, and Santa Maria, the three ships that bore Columbus and his companions across the Atlantic to discover the Western hemisphere were small wooden ships; that the first American man-of-war to bear the Stars and Stripes flying at her peak, hoisted there by America's most picturesque naval commander, John Paul Jones, was the good ship 'Ranger,' the ship that carried to France the despatches which brought about the Franco-American alliance, the ship which carried her redoubtable commander to victory against the British sloop-of-war 'Drake,' and the 'Ranger' was built of wood; also that Lord Nelson's flagship 'Victory,' which bore him as he swept the combined navies of France and Spain from the high seas at Trafalgar, likewise was built of wood.

"Thoughts of these glorious deeds led on to consideration of the peaceful pursuits which followed. I remembered that the ships which carried the commerce of Britain and America to the four corners of the earth were all built of wood; that within the memory of many people living to-day no ships had ever been built except of wood. The first iron ship was launched in 1850, and the first steel ship was not built until 1880, which is within my own recollection. I decided that if wooden ships had been useful throughout so many ages they could still be made to serve a useful purpose. There were great forests of suitable timber in British Columbia, plenty of idle men to do the work, and sawmills, all but idle, to cut the timber. Nothing, therefore, remained to be done except to arrange for financing the enterprise and to find a man or men skilled in the all but obsolete industry of building wooden ships.

"In the fall of 1915 others who had been thinking along the same lines with myself were quite willing to join in an agitation for government assistance to get the industry established. All public bodies and organizations in Victoria, including the Inner Harbor Association, went on record as being in favor of the government granting a measure of assistance. Deputations waited on the Premier and Ministers of the Province of British Columbia, and the suggestions made were favorably received, with the result that an act to encourage shipbuilding was passed and became a law on the 31st day of May, 1916.

"Immediately after the enactment of the legislation my associates in the sawmill business organized a shipbuilding company, called the Cameron-Genoa Mills Shipbuilders, Ltd. All of the capital was supplied by the Cameron Lumber Company, Ltd., and the Genoa Bay Lumber Company, Ltd., which accounts for the name of the new organization. It would not be proper for me to fail to mention the fact that this industry owes its inception in British Columbia largely to the efforts of Mr. R. T. Elliott, K.C., the president of the Genoa Bay Lumber Company, Ltd., and the enactment of the measure encouraging this industry to Mr. H. B. Thompson, who was at that time a member of the British Columbia Legislature, and took charge of the bill and worked unceasingly thereon until it became a law. He was then made chairman of the commission appointed to administer the law, and continued to lend every assistance in his power. As soon as possible a site was secured on the shore of Victoria Inner Harbor, and the work of erecting necessary buildings and installing machinery was rushed with all possible despatch. Three keels were laid down in rapid succession.

Brought Prosperity to Lumber Industry

"But I am getting ahead of my story. In the first place, we needed an experienced naval constructor, and, after searching far and wide, we discovered Mr. J. H. Price, of Portland, Ore., who was at that time putting the finishing touches on the big wooden schooner 'City of Portland,' at St. Helen's. He was induced to come to British Columbia by Mr. H. W. Brown, of the Canada War Coast Navigation Company, Ltd., who was taking a most active interest in the new enterprise. Mr. Price at once saw the many advantages which Victoria had to offer for the carrying on of the industry, and became associated with us. His plans for the ships were adopted, and he was charged with the supervision of the work. On his recommendation, Messrs. Dean and Lloyd Johnson (brothers), who had been running a shipyard in Seattle, were engaged to take charge of the actual work of putting in the buildings and machinery at the yard and of carrying on the construction. The Johnson brothers came to Victoria and started the work on the fifteenth day of June, 1916, which date, I believe, will come to be remembered as the day when prosperity returned to Victoria. For more than a year previous to that date our sawmills had operated at a loss, business was at a standstill, men tramped the streets looking for work. It was only a few months thereafter before several hundred men were employed in the shipyard, where large quantities of lumber were being used up; new logging camps had to be opened up; men were engaged in the woods to get out knees and spurs and masts; our mills were operated to capacity. To-day the monthly payroll at this one shipyard is $60,000.

"The first ship (christened 'Margaret Haney') was launched on the third day of February, 1917. Long before she had been chartered to carry a cargo of lumber to Australia from one of the British Columbia mills. Immediately after the launching of the 'Margaret Haney' the keel of the 'Malahat' was laid down. In rapid succession the ships 'Laura Whalen' and 'Esquimalt' were launched, and other keels were laid in their places. Now the 'Malahat' has been launched, and will be ready within a few days to receive her cargo, which the Cameron Lumber Company and other British Columbia mills are cutting to send to Australia. There are now on the ways at the Cameron-Genoa shipyard four ships, two of which are being built for the British Government, according to plans prepared by the Imperial Munitions Board. They will be steam schooners and will have no sails. Mr. Price, the president and general manager of the Cameron-Genoa yard, advises that the company has undertaken to build four of the steam schooners for the British Government, and has the option to build two additional.

"Another company, called the Foundation Company of British Columbia, Ltd., has established a shipyard on the water-front of Victoria Inner Harbor, immediately adjoining the yard of the Cameron-

Genoa Company. This new company began work about the 1st of July, 1917. They had three keels laid and the framing of one ship almost completely up when I left home yesterday. This company is devoting itself entirely to building ships for the British Government. Contracts for twenty-five of the wooden steam schooners have been let to the shipyards in Victoria, Vancouver, and New Westminster, and the work thereon is being rushed with all possible speed.

"The vessels built from the Price plans are all five-masted schooners, equipped with auxiliary gas engines, and designed primarily for lumber carriers. They are 253 feet long, 44 feet beam, and 21 feet depth of hold. Those which have been loaded have carried between fifteen and sixteen hundred thousand feet of lumber. Their performances have been quite satisfactory—in fact, equal in every respect to expectations. The ships being built for the British Government in the British Columbia yards are of an entirely different type. They will have no sails, will be propelled with steam engines, and are designed for general freight carriers. They are all to be built from one plan, and will be 275 feet long over all, 44 feet beam, and 25 feet depth of hold. These wooden ships may not be as serviceable as if built of steel, nevertheless they will be of great use. First, they will help to win the war, and after that each will carry many hundreds of tons of freight to England, France, and Belgium—articles necessary for rebuilding and restoring the countries which have been devastated by the war.

"A recent copy of the London Times makes a statement that the net losses of British merchant ships for the first eight months of 1917 amount to 676 ships, of a tonnage of 2,550,000. This figure takes into account all the ships which have been built during the said period, and does not include the ships of any other nations. It is, therefore, quite evident that the number of ships being built must be increased or the destruction stopped, if we are to continue to have ships for carrying on our commerce.

"We have thoroughly demonstrated the utility of the wooden ship, and I contend it is a duty which Americans and Canadians alike on this Northwest Coast owe to their countries generally, and their own businesses in particular, to lend every assistance to the production of ships built of our native Douglas fir timber."

Toronto Shipbuilding Company's Operations

One of the companies which have received contracts for the construction of standard wooden vessels for the Imperial Munitions Board is the Toronto Shipbuilding Company, Ltd., whose office and works are located at the foot of Cherry Street, Toronto, on the new industrial property created by the filling in off Ashbridge's Bay. The company has contracts for two standard wooden vessels, one of which is already well under way, and will be launched about the first of May. The company expect to launch the second vessel about the first of June.

The vessel now under construction has been laid down on a site parallel to the ship channel, into which it will be launched. Since the framing work was commenced, a short time ago, good progress has been made, and most of the framing has now been completed. When the company is operating fully it will give employment to about 200 men.

The plant and equipment of the Toronto Shipbuilding Company includes a moulding loft 85 x 45 feet, a mill 85 x 67 feet, yard, offices, etc. The equipment of the loft includes one 36 in. band-saw for cutting the moulds, and a carpenter's outfit. The equipment of the mill, which is located on the ground level beneath the moulding loft, includes one 48 in. Fay & Egan bevel ship-saw; one band-mill, 24 in. x 32 in.; one 8 roll 20 x 30 in. Boss timber sizer; one 48 in. cut-off saw; one 40 in. band-saw; one saw table; one jointer; one single surfacer; three 5-ton cranes; one locomotive crane; two derricks, and a complete saw-filing outfit.

Propeller post for one of the Toronto Shipbuilding Company's standard wooden vessels.

The plant is operated by individual motors, totalling 150 h.p. A 60 h.p. boiler supplies steam for the wood steaming boxes and for two air compressors.

The company's yard covers an area of 600 x 200 feet.

The vessel is being constructed of British Columbia fir, which is being used for the frames, keel, planking, etc.—in fact, for everything except the rubbing or fender streaks and the bulwark rail, which are to be of oak. The keel, also, will have an oak shoe 3 in. deep.

The Toronto Shipbuilding Company, Ltd., is incorporated under the Ontario Companies Act, with $100,000 authorized capital. The following are the officers: C. S. Boone, president; J. E. Russell, vice-president and managing director; C. A. Boone, second vice-president; J. M. Russell, secretary; J. J. Manley, treasurer, and C. L. Hays, engineer and superintendent.

With the launching of the Malahat, the fourth schooner to take the water from the Cameron-Genoa Mills Shipyard, Victoria, and the schooner Mabel Stewart from the Wallace Shipyard No. 2, North Vancouver, the fifth schooner to be launched for the latter concern, only three more vessels of this type remain to be launched by these yards under the present program, two of which are nearing completion at the plant of the Cameron-Genoa Shipbuilders, Ltd., and the other being well along at the Wallace yard. After completing the fleet of twelve ships, all of which are of the auxiliary schooner class, half of which were ordered at Victoria and half in North Vancouver, both of the yards mentioned will give all of their attention to the building of wooden steamers for the Imperial Munitions Board.

The Merchants' Shipbuilding Corporation has been incorporated at Victoria, B.C., to carry on a shipbuilding business at Vancouver, with a capital off $500,000.

Bevel band-saw in operation upon framing timbers at Toronto Shipbuilding Company's plant.

View of operations at Toronto Shipbuilding plant about October 17, showing frames partly erected—Mill and moulding loft on the right.

Submarine Chasers

The accompanying illustration shows one of the fast motor boats known as submarine chasers, which were built in Canada for the British Government. About 550 of these vessels were built in one shipyard. They are twin screw, gasoline-driven boats, and practically of a new design. The dimensions are: Length over all, 80 ft.; beam extreme, 12 ft.; depth at side, from top of rabbet to top of beam, 6 ft.

They are furnished with two standard right and left gasoline marine engines, having six cylinders 10 x 11 in. and developing 220 h.p. The engines are fitted a short distance aft of amidships. With this power plant a speed of 20 knots was easily exceeded. Fuel is carried in four tanks. The boats have fine lines and are handsome

One of 550 Submarine chasers built in Canada for Great Britain.

looking, and when running at high speeds leave a good, clean wake. They are flush decked, with a small steering and chart room just forward of amidships, and also a small house or casing over the engine gun, while aft is a lifeboat about 14 ft. long.

The hulls are subdivided by five steel and one wooden watertight bulkheads. In the forepack is a storeroom for provisions, etc.; also gasoline tanks, behind which is a crew space, with ample accommodation for eight men, while aft are smaller but more comfortable quarters for two officers. The floors in the living quarters are covered with linoleum. The engine-room floor, of white oak, is covered with light sheet metal. Hinged hatches and ladders lead into the storeroom and crew's quarters; also the engine and dining-rooms. A companionway, with slide and steps, leads down to the staterooms. The keel and stem are of white oak, 1¾ in. frames. 2½ in. deck beams, and 2¼ in. roof beams of the same material. The keelsons and planking are of yellow pine, bulkheads and cabin top of white pine decking, and cabin sides of Oregon pine. The rudder is of the outboard balanced type, and is made of manganese bronze, as are also the propellers.

Fraser, Brace & Co.'s Operations at Montreal

The site of the new shipyard of Fraser, Brace & Co., Ltd., is on the Lachine Canal, in the Cote St. Paul District of Montreal. The company has contracts for four standard wooden ships for the Imperial Munitions Board. The area of the site is approximately eight acres. The Canadian Pacific and the Grand Trunk Railroads are on either side, so that freight can be received from both. A complete installation of modern equipment for wooden shipbuilding has been made.

Advantage has been taken of the existence of an old slip opening into the canal at this point. The entrance to this slip has for its sides the concrete abutments of the bascale bridge on the C.P.R. The distance between the abutments is the same as the width of the locks of the canal. This slip is being deepened to a sufficient depth of water to permit the side launching of vessels, and is being lengthened to 600 feet, or more than twice the length of a canal-size vessel. Stop-logs are to be used to cut off the water from the canal so as to permit the drying of the basin, which is thus used as a drydock. Two vessels of the four now contracted for will be built in the bottom and launched by simply flooding of the drydock. The other two will be built on the sides to be side-launched into the dock. There is room for the construction of two other vessels in the bottom and at least two other vessels on the sides.

Buildings have been erected for offices, stores, air compressor, transformers, sawmill, carpenter shop, blacksmith shop, machine shop, and framing. A mould loft, 150 ft. x 50 ft., has also been provided.

The power to be used will be electric, the sawmill, compressor hoisting equipment, etc., all being electric motor-driven.

Timber of many kinds will be used for the four 2,500-ton boats at present under way, including Oregon fir and British Columbia fir. Local hardwoods are to be employed to a certain extent now and in the future vessels it is planned to develop the local supply so that boats can be built with only a small proportion of timber brought from distant points.

Government Assistance Suggested for Wooden Vessels

Editor of Canada Lumberman:—Allow me to suggest that, while the present assistance and encouragement given by the government to the builders of wooden vessels on specifications and of material in accordance with a standardized plan is admirable, it might wisely be extended to all responsible and reliable parties prepared to undertake the construction of vessels of five hundred tons and upwards suitable for ocean freight carrying. There are places on the St. Lawrence and in the Maritime Provinces where such ships could be constructed principally of birch and spruce, woods readily obtainable at no great distance from the shipbuilding sites, and there are competent men ready to undertake such construction, with encouragement and reasonable, while not in a position to meet the government requirements for a standardized vessel of large size. There is a present shortage of the timber as specified by the government, but an abundant supply of suitable spruce and birch, which would be the principal material in the building suggested. It is quite clear there will be employment for long to come for ocean-going vessels of any size, and small vessels, while they have drawbacks, certainly have the present advantage of dividing the risk.

Yours truly,
Ed. HarperWade.

Toronto's New Drydock

The development of the shipbuilding industry and the prospective increase in the number of vessels plying the Great Lakes has made it all important to such a Great Lakes port as Toronto that it should have a good drydock in which vessels can be hauled up for repairs. The Toronto harbor commissioners realized this at an early date, and their efforts to secure a drydock recently resulted in the installation of a large and modern drydock in the new ship channel at the foot of Cherry Street. The accompanying illustration shows the drydock, with its first ship hauled up and being repaired. This is the first drydock of its kind in Toronto. It was built in three sections, each 65 feet wide, and was brought to Toronto from Sturgeon Bay, Wis.

The Toronto Drydock Company, Ltd., has been incorporated under the Ontario Companies Act, with $100,000 authorized capital and office at Toronto, to take over a drydock or drydocks, at Toronto, and to build, own, and operate steam and other vessels. Among those interested in the company are C. S. Boone, president, and J. E. Russell, vice-president and managing director Toronto Shipbuilding Company; L. Solman, manager Toronto Ferry Company; J. J. Manley, and H. Dickson. The dock is a small one, capable of handling vessels up to about 160 ft., and is somewhat in the nature of an experiment. It is said that if there is sufficient inducement in the way of vessel repairs, etc., the company will build a modern floating drydock to accommodate the large type of lake vessels. The company is stated to have made application to the Dominion Government for a subsidy.

A vote was passed recently in the House of Commons to appropriate $600,000 for the construction of wooden ships in British Columbia. When completed they will trade between Pacific Coast ports and Atlantic Coast ports.

Toronto's New Drydock.

The Duke of Devonshire, Vice-President of the Navy League for the Empire and Patron of the Navy League of Canada.

The Navy League of Canada

Affiliated with The Navy League of the British Empire

In all times and in all struggles the Nation with the Sea-borne carrying power properly defended has been triumphant. This war has demonstrated as never before the absolute dependence of all parts of the Empire upon its Naval Defence and its Mercantile Marine.

Realizing this, a number of citizens have already banded themselves together in different parts of the Dominion to organize the Navy League on the following general lines:—

1—The Governor-General as Patron of the Dominion; the Lieut.-Governors as Patrons of their respective Provinces.
2—A Provincial Branch with a President, a Vice-President and an executive; the Provincial Presidents elect from amongst themselves a Dominion President and together they form the Dominion Executive.
3—Each Provincial Branch retains its autonomy, but contributes a certain portion of its funds to carry on the Dominion Organization, and they in turn contribute a certain proportion to the parent Navy League of the Empire. In order to bind the Naval interests of the Empire more closely.

The work of the Navy League is not new to Ontario, Toronto holding a warrant of the year 1895, Number six in the series for the whole Empire. At a meeting recently convened at Government House by Sir John Hendrie, K.C.M.G., C.V.O., Lieutenant-Governor of Ontario, at which there were present many influential citizens of Toronto and elsewhere, it was determined to continue and extend the work under that warrant as a Provincial Charter.

The Constitution to be operative in Canada is that received from Great Britain, and is similar to the Constitution of the Navy League of Australia, New Zealand and South Africa. The principal objects are as follows:—

1—Thoroughly organized educational campaign in matters pertaining to the Navy and the Mercantile Marine.
(a) By Lectures.
(b) By the circulation of Literature.
(c) By placing Readers in Public Schools.
2—To raise funds for the relief of British and Canadian Sailors and their dependents, and for Sailors' Homes, Institutes and Hospitals in Canada and throughout the Empire.

It is known that out of the millions of tons in merchant shipping that have been sunk during the war the dependents of crews who have lost their lives are in many cases in dire necessity. There is no patriotic fund or pension system covering their cases, notwithstanding that this class of the community is to-day really the most important and the one on which we depend the most, for without sailors to man the ships our products both from the mine, field, factory and fisheries would not reach their destination; the trade of the Empire would cease, and the countries of the Empire open to invasion.

3—To encourage volunteer Naval Brigades for boys and young men in which they can receive practical and theoretical instruction in seamanship to prepare themfor service in our Mercantile Marine or the Navy.
If we are to become a greater exporting nation we must now commence to educate our boys and young men in seamanship. Unless something is done in this respect the Canadian Sailor will cease to play his part in the Dominion or the Empire.

TO THE SECRETARY OF
THE NAVY LEAGUE OF CANADA,
34 KING STREET WEST, TORONTO.

Please enrol my name as

Ordinary Member / Founder / Junior Member } .....

of the Navy League of Canada for which I enclose annual subscription

of .....

I, having read or being already acquainted with the objects for which the Navy League of Canada was established and now exists, do hereby declare myself to be in full agreement therewith, and the policy indicated therein, and undertake so long as I remain a member of the League to support such objects of policy.

NAME .....

ADDRESS .....

.....

MEMBERSHIP

1—FOUNDERS (elegible only to those who enter the first year of the organization; these are life members) $100.00
2—MEMBERS .....$5.00 Annually
3—ASSOCIATE MEMBERS ..... 1.00 "
4—JUNIOR MEMBERS (18 years and under) .25 "

You are earnestly requested to become a member and use every effort to obtain others, and if you have young people in your family enroll them as Junior Members.

To every member will be given a Navy League Badge and Each Founder and Ordinary Member will be sent bi-monthly free the **illustrated magazine "THE NAVY" and other literature.**

The Constitution provides for local committees to be formed throughout the Provinces. We now wish to enroll members in each community to aid in the work of organization.

Commodore ÆMELIUS JARVIS, S.S.D.
President Ontario Branch

Steel Shipbuilding in Vancouver

J. Coughlan & Sons' Operations—Six Vessels Under Contract—Extensive Timber Consumption

While this issue deals particularly with wooden shipbuilding, it would not be complete without some review of the steel shipbuilding operations now in progress on the Canadian Pacific Coast.

The principal steel shipyard in British Columbia is that operated by J. Coughlan & Sons, one of Vancouver's pioneer concerns. This firm has undertaken the construction of six steel steamers of 8,800 D/W tons capacity, for delivery during 1917 and 1918. These boats will be 427 feet long, 54 foot beam, depth moulded 29 feet 9 inches, and with a speed, light, of about 11½ to 12 knots. The design will be after the well-known Robert Dollar type, with some minor modifications.

The capacity of these vessels will be about 490,000 cubic feet. Their permanent coal bunkers will carry 420 tons, and they will have also a reserve coal bunker capacity, available either for coal or cargo of 900 tons. Their fresh water tanks will carry 200 tons. They will be single-screw vessels of the cargo steamer type, with poop, bridge, and forecastle, the machinery being amidships. The vessels will have two masts, with four five-ton cargo booms on each mast, and two derrick posts, each fitted with one three-ton cargo boom.

They will be driven by steel turbines, designed for 2,500 s.h.p. at 100 r.p.m., which are being purchased in the United States, while the boilers are to be constructed at the shops of J. Coughlin & Sons, Vancouver, B.C.

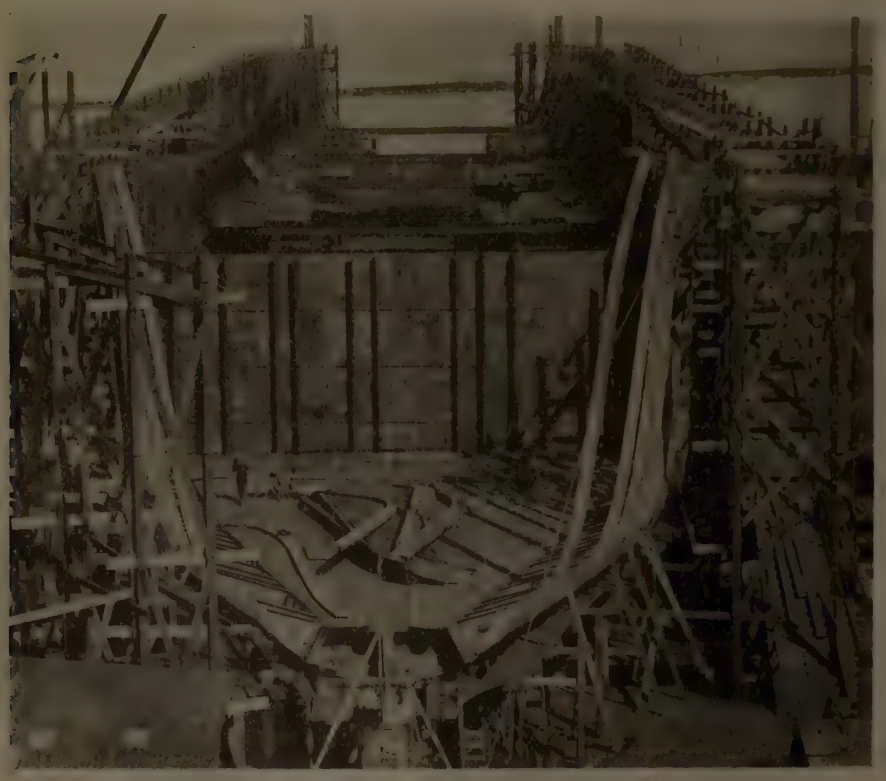
The vessels will be built under the survey of Lloyd's register of shipping to Class 100 A1.

The construction of these steamers will ultimately give employment to about one thousand men and provide for Vancouver a pay-roll of approximately $100,000 per month.

The execution of contracts of this magnitude in Vancouver indicates great courage and resourcefulness on the part of this firm, as many costly difficulties had to be overcome. The equipping of the plant for the construction of these vessels required an investment running into many hundreds of thousands of dollars, and on such of this equipment as was imported from outside of Canada, which comprised the greater portion of it, full duty had to be paid. Then on all the materials, machinery, and equipment for the boats which is imported from outside of Canada 1 per cent. duty must be paid.

It should be further borne in mind that the freight rate from the steel mills to Vancouver is higher than that existing to any of the principal American shipyards, even those yards located on the American Pacific Coast having lower rates of freight than are applied to Vancouver.

All of these factors constitute costly handicaps under which Western shipyards are obliged to operate, and these will have to be overcome or equalized in some way by the Canadian Government if steel shipbuilding is to become a permanent industry in British Columbia.



Steel ship being built at plant of J. Coughlan & Sons, Vancouver, B.C.—Note large quantity of timber used in this work.

The construction of these vessels will require approximately 3,500 tons of steel plates, shapes and rivets for each vessel, this being in addition to any material required for the boilers, engines, or mechanical equipment of the boats.

Barienger Brake Used in War Lumbering

War is the great test of equipment. To give satisfaction in war operation a machine or a device must be sturdy, must do what it is supposed to do without breakdown, and must not impede any enterprise in which it has a part. The lumber industry both of Canada and the United States takes great pride in the regiments of forest engineers that are either going to Europe or are already in Europe rendering effective aid in the war against Germany. Consequently, every precaution is taken to see that only the best and most dependable equipment is provided for these units.

The Ryther & Pringle Company, of Carthage, N.Y., manufacturer of the well-known Barienger brake, recently received an order for and has shipped to the British War Office twelve Barienger brakes, for the use of the Canadian forestry battalions in their operations overseas. In the overseas lumbering operations, both close to the firing line and in locations far removed from actual fighting operations, the timbered country is very rough, and consequently the problem of transporting logs and lumber to the portable mills calls for the very best sort of logging equipment. Timber must be cut wherever it is found, roads have to be changed frequently, and the supply of timber must be kept going to the front all during the winter. Assisting in this the Barienger brake is of much help. It does not weigh enough to prevent its being easily transportable; it is strong and entirely dependable; it is easy to operate, and not easily broken or put out of order; and permits loads to be safely and speedily got down hills that it would be impossible to negotiate without its aid. All of these things have been proved in Canada and the United States, where the brake has been giving absolute satisfaction in many winter logging operations.

The Ryther & Pringle Company is urging that all orders for the brakes be rushed. The company has a good supply of Barienger brakes on hand and can make prompt shipment, but because of the scarcity of ⅝ in. improved plow steel cable, which is the grade and size of steel rope used in connection with the brake, is unable to give definite assurances of the delivery of cable this winter. The extensive requirements of the government are responsible for this condition, as the wire rope is being used in making the nets employed to protect harbors against submarines. Of course the company has large orders with the manufacturers of this grade of wire rope, and will receive shipments just as promptly as it is possible to make them, and also has on hand a supply of rope sufficient to last for a time. However, there is no certainty when the government will have finished its work, and so customers are being warned against the possible shortage.

Preston Woodworking Machinery Co.'s Adjustable Ship Band Saws

The great revival in wooden shipbuilding which has taken place in Canada and the United States is responsible for a widespread interest in lines of woodworking machinery that are specially adapted for preparing ship timbers. One of the most important machines in the equipment of a wooden shipbuilding mill is the adjustable ship band-saw. The Preston Woodworking Machinery Company, Ltd., whose advertisement appears elsewhere in this issue, turn out a machine of this class, known as their No. 133 Preston Adjustable Ship Band-saw, which is greatly appreciated by those who have installed it. The use of this machine increases the production of the mill and results in a great saving of labor. The Imperial Munitions Board, for whom machines of this class were installed at Vancouver, writing to the company, say: "The reports we have from our yards are very satisfactory, and undoubtedly the Preston saw will be requisitioned and supplied if our equipment has to be increased in the future." The Preston Woodworking Machinery Company, Ltd., have supplied two dozen of these machines to plants in Nova Scotia, New Brunswick, and Newfoundland through their agents, the A. R. Williams Machinery Company, St. John, and they are advised that every machine is giving good satisfaction. This machine is hand-fed; its wheels are 42 in. diameter, and it is adjustable to angles of 45 degrees to the left and 10 degrees to the right.

Another excellent machine turned out by this company is the No. 134 Preston Adjustable Bevel Ship Band-saw, with power feed at a rate of from 57 feet to 90 feet per minute; 42 in. diameter wheels, and adjustable to angles of 45 degrees to the left and 10 degrees to the right. The company can also supply a number of other machines particularly adapted for wooden shipbuilding operations, and will be pleased to hear from any firms who are in need either of equipment or information in regard to their lines. Their sales agents are the A. R. Williams Machinery Company, St. John, Vancouver, and Toronto.

SIMONDS Circular SAWS

It is always to the advantage of mill owners and operators to use Simonds Solid Tooth and Inserted Tooth Saws, as well as Simonds Band Saws and Planer Knives. The Owner profits more by larger production, better lumber, and fewer delays. The Employee gains by working with safe and sure saws.

BABBITT METALS

By W. G. Harris, President
The Canada Metal Co., Toronto

W. G. Harris
President The Canada Metal Co.

The real serviceable value of a babbitt does not necessarily bear any relation to the intrinsic or commercial value of the elements from which it is made.

To illustrate this fact: Add 5 per cent. of gold to any of the high-grade babbitts and it will make them cost about fifty times as much, but it is quite evident that it will not make them wear fifty times as long.

The real serviceable value of all babbitt metals is directly proportioned to their registration in the physical properties which cover the conditions they are required to meet in service; and the value of all those physical properties increases in all metallic mixtures of perfect chemical affinity, and decreases as they recede from that condition in the mixture.

Therefore, it is self-evident that to add any element to a metallic mixture in excess of the amount required to produce a perfect chemism would operate as a double loss. It would add to the cost of the mixture and operate to disturb its molecular tension, which would injure the quality of all its physical properties and reduce its value as a babbitt metal. For this reason the most economical and satisfactory service is secured through the aid of an expert metallurgist who, knowing the physical properties required in the babbitt, goes to work in a scientific manner to produce a chemically united alloy at the least possible expense which will possess the required physical properties.

Invention and discovery in the line of metallurgical processes have within the last few years made some of the formerly rare elements available for use in this line of work, which enables closer chemical affinities to be established between the elements of metallic mixtures; and the expert metallurgist of the present age can design metallic alloys to meet special physical conditions with the same dependable accuracy that the expert mechanic designs special machinery.

A bearing metal has one definite service requirement—that is, to take care of the vital parts of machinery (the bearings). This cannot be accomplished with metal that is too hard or too soft. One increases friction, heat, and wear, while the other may not stand the load weight or speeds, but mash or squeeze or disintegrate. The mechanical problem is the simple solution of what is the limit of load weight to which the bearings of any machinery may be carried. That limit every intelligent mechanic knows cannot exceed 2,500 pounds load weight to the equare inch of bearing metal without disastrous results to the machinery, by either stalling the machine, destroying the bearings, breaking the belts, or wrecking the weaker parts of the machinery.

Investigation will prove that 75 per cent. of the machinery in operation does not carry as much as 1,500 pounds load weight to the square inch of metal in the bearings.

Physical Properties of Babbitt

The properties of a babbitt metal which determines its real serviceable value are as follows:

First.—Tensile strength, the index to a babbitt's wearing quality. That is, the greater the force required to overcome the molecular tension of a metal, or a straight pull, the greater will be the wearing force or friction required to overcome molecular tension at its wearing surface.

Second.—Resistance to crushing strain; the index to a babbitt's carrying capacity.

Third.—Elastic tension, the index to a babbitt's ability to resist vibration or pounding.

Fourth.—Resistance to heat; the index to melting point.

Fifth.—Anti-friction quality; the index to the degree of angle at which the factor of friction is overcome by the force of gravitation.

Regardless of their constituent elements, babbitts which register alike in the above physical properties will give like results under like conditions of service.

To obtain results from babbitt metals such as will enable one to guarantee efficiency there must be extreme care taken, and the methods adopted at the Canada Metal Company's plant are at once interesting, particularly from the fact that a uniform alloy is absolutely assured.

First, the metals to be used are tested for purity by a metallurgical chemist, and, when everything is found satisfactory, the melting process begins, and when each particular grade is being made, no less than thirty-five tons is made at once. In fact, there are three of these monster pots operating daily.

During the melting many tests are made to ensure a perfect chemical affinity of the mixture. After being poured and before being passed into stock it is again tested for hardness by the Brinell method and on a friction testing machine, and the babbitt must stand up to all tests or it is discarded.

My experience has been gained during the last thirty years by studying all requirements, and whenever a difficult problem arose it was a pleasure to try and overcome same. Each problem was a step up the ladder of experience.

As babbitt metals by the Canada Metal Company are all made under such scientific principles, a word as to how to obtain best results may be added as a guide to the machinists.

Pour the babbitt metal at as low a temperature as is consistent with the filling of the moulds.

Red hot metal is overheated and has a tendency to form a dense grain. Avoid red hot metal.

Stir well before pouring.

Keep metal pure and separate from others for best results.

Our babbitt metals may be poured indefinitely. They will not deteriorate.

When pouring, strike in the centre, hitting lightly, and work to the outside.

In pouring have riser and pour down on the shaft.

Do not tighten upper half of box hard until bearing is settled.

Heating the shell to from 100 degrees to 150 degrees C. before the babbitt is poured into it tends to prevent blow-holes and similar defects, and also prevents the lining from shrinking away from the shell.

Babbitt bearings must not be jarred while the metal is solidifying, since any disturbance at this temperature tends to enlargement of the crystals and corresponding brittleness.

Almost a month ahead of schedule, the first hull for Uncle Sam's wooden fleet of commerce carriers has been rushed to completion for launching at an Atlantic shipyard, and is now afloat. Through the co-operation of the lumber industry, the Emergency Fleet Corporation's whole program is being speeded up. Within a short time, it is said, a ship a day will be put in the water for Uncle Sam at yards along the Atlantic and Gulf, in addition to almost as many wooden vessels being built for private interests. The Pacific Coast will also contribute about 200 standard type wooden steamers.

For sale, or will exchange for good ranch or farm land, B. C. Tide-water stumpage, cruised and surveyed.

CARL BLOCK,
19-t.f. Peoria, Illinois.

For Sale

About five or six tons of 5/8 and 9/16 tested chain in lengths from 27 ft. to 30 ft. with ring on one end and hook on the other end. Address Drawer "F," Sarnia, Ont. 19-t.f.

Partner Wanted. Am desirous of getting in touch with a young experienced lumberman who has a general knowledge of the wholesale lumber business and the consuming trade in Toronto; must be capable of taking charge of business management. I am prepared to invest $20,000 to operate a business in Toronto and share profits, or would consider investing in a going lumber business in Toronto that is financially sound, and making money, which could be increased by additional capital. Correspondence strictly confidential. Box 649, Canada Lumberman, Toronto. 22-22

FOR SALE
as a Going Concern
Saw Mill and One Hundred Square Miles Crown Lands

Mill capable of sawing eight million superficial feet per year. New boilers, good engine and pumps, gang and rotary shingle and lath machines and planer. Railway siding in yard, also water shipping.

This property is situated in a thriving centre where labor is available. Good general store, boarding house and other buildings in connection with property. Good reasons given for selling.

No one need apply except bona fide purchasers.

Apply, Lumber, Box 643, Canada Lumberman and Woodworker, Toronto, Ont. 22-t.f.

Jobbers Wanted

We wish to let several contracts to take out logs on Berth No. 6, being broken front lying between the Magnetawan and French Rivers. This berth is all convenient to Canadian Northern Railway.

John Harrison & Sons Company, Limited,
Saw and Planing Mills,
9-t.f. Owen Sound, Ont.

FOR SALE
Lumber Mill, Lumber Licenses and Sawn Lumber

There will be sold at Public Auction, at the Court House, in Newcastle, New Brunswick, Canada, on the twenty-ninth day of November, instant, at twelve o'clock noon, a steam saw mill, situate at Bartibogue, on the Miramichi River, New Brunswick, equipped with band and re-saw, double edger, trimmer and lath machine, capacity about forty thousand feet daily. Also, fifty-five and a half square miles licensed lumber lands, under license from Government of New Brunswick. Also, right to cut all lumber, except spruce, on ten and a half miles similar licensed lands, all of which lands are situate upon or adjacent to Bartibogue River and its branches, which empties into Miramichi River near the Mill. Also, booming rights, booms and other equipment, all of which will be sold in one lot, so that it can be taken over as a going business, which properties are known as the James A. Rundle & Co., lumber property. Also, immediately after the above mentioned sale, there will also be sold at public auction, what remains (subject to previous sales) of this season's lumber cut, which consists of about 1,300,000 M. sawn lumber 2 x 3 to 2 x 10. Also about 1,000,000 M. 3 x 3 to 3 x 11. Also about 120,000 M boards. Also about 1,700,000 laths, all of said lumber will average about 60 per cent. princess pine, balance spruce.

For full particulars apply to Hon. J. P. Burchill, Nelson, N.B., or to Mr. Claud Brown, Chatham, N.B., or to the undersigned, at Bathurst, N.B.

Dated this first day of November, 1917.

GEORGE GILBERT,
22-22 Master, Supreme Court.

TENDERS
for Pulpwood Limit

Tenders will be received by the undersigned up to and including the seventeenth day of December next for the right to cut pulpwood and pine timber on a certain area situate in the vicinity of the Kapuskasing River in the Districts of Timiskaming and Algoma.

Tenderers are to offer a flat rate per cord for all classes of pulpwood, whether spruce or other woods. The successful tenderer shall be required to pay for the Red and White Pine on the limit a flat rate of $10 per thousand feet board measure.

The successful tenderer shall also be required to erect a mill or mills on or near the territory, and to manufacture the wood into pulp and paper in the Province of Ontario, in accordance with the terms and conditions of sale which can be had on application to the Department.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for Twenty-five Thousand Dollars ($25,000.00), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said Twenty-five Thousand Dollars ($25,000.00) will be held by the Department until such time as the terms and conditions of the agreement to be entered into have been complied with and the said mills erected, equipped and in operation. The said sum may then be applied in such amounts and at such times as the Minister of Lands, Forests and Mines may direct in payment of accounts for dues or for any other obligation due the Crown until the whole sum has been applied.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.
Toronto, September 19th, 1917.

N.B.—No unauthorized publication of this notice will be paid for. 20-24

Tenders for Timber
on
Lower French River Reserve

Sealed tenders, addressed to the undersigned, and marked on the face of the envelope "Tender for Lower French Timber," will be received until noon of Wednesday, November 28 next, for the merchantable pine, hemlock and cedar timber on the Lower French River Reserve in the district of Parry Sound.

Tenderers should state the amount of cash bonus they are prepared to pay for the timber over and above crown dues payable under sworn returns furnished by a licensed culler. The tariff of dues is as follows:—

Pine, $2.50 per M.f.b.m. or $25 per M.cu.ft.

Hemlock, $1 per M.f.b.m. or $10 per M.cu.ft.

Cedar, $1.50 per M.f.b.m. or $15 per M.cu.ft.

The rate of dues on timber taken out in other form than saw-logs can be had on application.

An annual license will be granted to the successful tenderer and five years will be allowed for the removal of the timber under the Regulations of the Department. A copy of such Regulations can be secured from the undersigned.

An accepted cheque on any Canadian chartered bank for ten per cent. of the bonus tendered should accompany each tender, the balance of the bonus to be paid within thirty days from the date of notification of acceptance of tender.

Any further information that is desired can be obtained upon application to the undersigned or to Alex. Logan, Indian Superintendent at Parry Sound.

The unauthorized publication of this advertisement will not be paid for.

DUNCAN C. SCOTT,
Deputy Supt. General of Indian Affairs.
Department of Indian Affairs,

Review of Current Trade Conditions

Ontario

The lumber trade in Ontario is difficult to describe at present. A group of lumbermen who recently discussed the situation was unable to come to any agreement upon details, except that operations in the woods during the coming winter would be greatly curtailed. This is undoubtedly the case, and is largely the result of shortage of labor and increased cost of all kinds of supplies. Many of the large manufacturers who usually have made considerable headway with their logging operations by this time of year still report that they are very short handed, and do not know how much they will be able to take out during the winter.

Transportation problems are worrying the trade from one end of the province to the other, as they are throughout Canada generally. Canadian railways are refusing to permit their cars to go out of the country with lumber, and even in some cases will not allow them to be loaded for shipment on to other lines than their own. So anxious have they become about the shortage which is upon them that they are doing everything in their power to retain possession of their own cars. There seems to be no question that during the coming winter the car shortage will be extremely severe, and dealers who have not been able to obtain their supplies early will have a struggle to keep up even with the small amount of trade that they expect.

There is very little to say in regard to the price situation. Manufacturers and wholesalers seem to be pretty generally of one opinion, namely, that the present is no time in which to think of lower prices. Leaving out of consideration entirely the greatly increased cost of production which will have to be borne by next year's lumber output, the actual demand for lumber promises to continue on much the same level as that of to-day, which means that everything produced can be sold, and that there is no necessity for disposing of stocks at a loss.

A short time ago there was considerable talk of easier prices for hemlock. To-day the feeling in this regard seems to have passed entirely away, and hemlock manufacturers and wholesalers are of the opinion that prices will continue firm. Some manufacturers of white pine are talking of prices all the way from $5 to $10 higher for next year's output than the prices which have prevailed during the present year. Shingles had a slight easing off a few weeks ago, but apparently the drop in price was the result of a misunderstanding of the situation in British Columbia, as the price has stiffened again.

Eastern Canada

The car shortage is the most important feature of the lumber trade situation at Montreal and throughout the eastern provinces. The trouble is felt most severely by wholesalers who have United States connections. The pulp and paper companies also report that it is becoming more and more difficult to obtain cars. There is a strong demand for Canadian lumber in the United States, but it is not possible to deliver anything like the quantity that could be exported if cars were available. The shipbuilding industry is also handicapped for the same reason and construction of some vessels is being delayed. It is reported that the Imperial Munitions Board is ready to place orders for 1,000-ton wooden vessels at a straight contract price, and that they are in favor of using Eastern Canada timber for these vessels, rather than B. C. stocks. Preliminary negotiations along this line are under way. A recent report states that the Imperial Munitions Board has undertaken to place contracts in Canada for $50,000,000 worth of shells required in the United States. This will be a great benefit to the wooden shell box manufacturers.

The labor situation is continually growing worse. Lumber, and pulp and paper companies are earnestly discussing the possibility of securing exemption for a sufficient number of men to run their plants and to carry on operations in the woods. The export trade to the United Kingdom is very small. Total shipments from Montreal for the present year will show a large decrease as compared with last year.

Spruce manufacturers in the Eastern States report that they are able to dispose of their stocks without difficulty at firm prices. The demands from industrial sources and from the government have made up for the reduced volume of house-building. The car shortage in Canada is preventing much lumber from going across the line to United States markets. Spruce manufacturers in the Virginias and the Carolinas are also prevented by railroad embargoes from shipping extensively into Northern territory. Prices all remain very firm. Hemlock manufacturers report that the demand is not up to normal, and that stocks in first hands of retailers are away below normal. Hemlock prices show very little change, most sales being at the list, although some are 50c to $1 lower. Shingles and lath at Boston are very quiet on account of the absence of house-building.

United States

The yellow pine situation among the Southern manufacturers is dominated absolutely by the urgency of the demand for shipbuilding timbers. All other business is of secondary consideration, and further restrictions on the sale of yellow pine ship timbers have been imposed by the government. An embargo has been placed upon every stick thicker than 2 in., wider than 10 in., and longer than 20 ft., which can be used for a ship schedule. The demand for timbers from the railroads and other sources is also very keen, and many of these buyers will be obliged to turn to shortleaf. There will be a large amount of lumber available for house-building and other uses, as the production of ship timbers results in a fair proportion of lumber not suitable for the government work. An increase is reported in the demand for yard and shed stock in most sections. Both production and orders show a decrease, and shipments are about the same as during the past few weeks. Prices have shown some improvement. The government has also been purchasing extensive quantities of hardwoods for shipbuilding ,and it now looks as though the demand for this purpose will be increased greatly.

The Western pine markets are not very active. California and Southern Oregon mills are receiving more orders than Inland Empire mills. Sales of white pine in the extreme East are increasing. Thirty-four Inland Empire mills report for the week ending October 20 that they received orders amounting to 13,550,000 feet. Their shipments were 18,677,772 feet, and production was 22,829,793 feet. Prices continue firm. The redwood mills are having trouble getting sufficient cars to move their orders. The demand for redwood in the East, however, is not so brisk as it would be if deliveries could be made promptly. Redwood prices are firm.

The United States Government has practically taken the entire Douglas fir manufacturing business under its direction. The government has stopped export, even holding the departure of loaded vessels until the supply of ship and airplane lumber can be greatly increased. Every resource of the Douglas fir manufacturers is now being directed to the production of fir for ships and airplanes. Ordinary trade will be allowed to shift for itself in any way it can. The car situation is worse than it was.

Great Britain

In former years the middle of October has seen quite a number of contracts closed for the ensuing season's shipments of lumber and timber to Great Britain. This year nothing in the way of forward contracts has yet been reported. The whole situation has been greatly changed during the past twelve months. It is not thought probable that anything will be done in the way of forward buying for some time to come, as there is absolutely no basis for the calculation of future values.

At London the dock deliveries of softwoods show a considerable improvement as compared with a short time ago, but are much smaller than those of a year ago. The usual wood dock statistics, however, are misleading nowadays, as they do not show the full amount of imported softwoods going into consumption. Supplies are drawn from many other sources, including home-grown woods. Fairly large arrivals are reported, and improvement is shown in the quantity both of sawn and planed goods. Stocks of planed goods in London are still quite heavy, and compare favorably with those of other years. General trade at London is quiet, but industries of a war nature are fully employed and are using large quantities of all kinds of wood. Quite a number of new factories are being put up, which are making business for firms which formerly were engaged in turning out material for private buildings.

The trade at Liverpool shows practically no change of interest. The scarcity of spruce deals has prevented business of any importance for some time past, and importers are protesting strongly against the increased limitation of imports. It is generally felt that the time has come when some consideration must be shown to the timber trade, if it is not to be extinguished altogether. American hardwoods at Liverpool show no change. A few parcels have arrived of late, and have been sold at very high prices. The Manchester trade is much the same as that at Liverpool. Stocks are much reduced, and practically everything on hand is owned either by the government or special customers. There seems to be no prospect of new goods coming forward,

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

although there are plenty of enquiries, particularly for softwoods. Arrivals of spruce and pitch pine are limited solely to what is required for government contracts.

The trade at Glosgow continues dull, being greatly restricted by the import regulations. Recent small imports of spruce from Montreal—some 100 standards altogether—were quickly bought up, the price being considered as of little importance, compared with the actual securing of the goods. Other imports are confined to occasional small shipments of clear spruce and American furniture woods. A few sales of birch plank are reported, but in most cases they are resales back from one merchant to another. Deliveries from Glasgow docks are on the smallest possible scale.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Market Reports—More Shell Box Orders

Ottawa, Nov. 6.—(Special correspondence to the Canada Lumberman.)—The last two weeks have seen practically no change in the Ottawa lumber market. The tendency toward firmness continues. There has been no change in prices, and the market is not overstocked. Some dealers are of the opinion that stocks are low. Work on the shell box contracts let in October is proceeding satisfactorily.

The transportation and labor problems continue to grow more troublesome. It is authoritatively estimated by the trade that between twelve and fifteen million feet of lumber on order is tied up at Ottawa owing to cars not being available. The woods operations of the mills are more or less unsettled. Camps are being established, but, on account of the shortage of labor, they are not being fully manned. Mill labor with the manufacturing plants is also running short.

The Canada Lumberman is authoritatively informed that further new tenders for shell boxes have recently been issued by the Imperial Munitions Board. All the shell box manufacturing plants on the list of the Imperial Munitions Board have been asked to figure on the new tenders. The Imperial Munitions Board stated to the Canada Lumberman that it does not expect the returns to be in or completed before the end of this month. The call for new tenders indicates that it is the intention to continue the manufacture of shell boxes in Canada. The tenders called are for 6 in. and 4.5 boxes.

The demand for lumber for building purposes has fallen off. The demand for mill refuse for fuel continues.

There appears to be little hope in sight for improvement in the car situation, although the recent appointment of a committee of Canadian railway heads at Montreal is expected by the trade to help the situation to some extent. This committee will probably visit Washington in the near future, to make representations for the return of Canadian box cars now on American rails. Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association, reports that the car situation at Ottawa is no worse than in other parts of the country.

Mr. Jackson C. Booth reports that the John R. Booth sawmill at the Chaudiere will be completely closed before November 15. The cut this year was not so large as last year. Mr. Booth could not estimate this season's cut. For some time past the mill has only been running during the day. Mr. Booth says he does not believe there is a lumber manufacturer in Canada making money to-day. The decrease in domestic consumption, restrictions placed on the export trade, and the increased cost of labor and supplies are proving costly to the lumbering industry. The 1917-18 woods cut of this mill is still unestimated. The woods labor situation remains unsettled. About two hundred men are affected by the closing of the sawmill.

The McAuliffe-Davis Lumber Company is making satisfactory progress on its shell box contract, the contract for which is for twenty thousand boxes. This contract is expected to be completed about the latter part of this month. Enquiries and demand for building and other grades of lumber are reported to be slow.

Gilmour & Co., lumber brokers, report that prices are likely to stiffen during the coming months, and that before spring an increase of $5 per M. will occur on all grades of lumber used for building purposes and shell box work. Available stocks, they say, are low.

The early part of November brought about little change with the W. C. Edwards Company. Orders are continuing fairly well. In local or domestic trade there has been no change. The company is still engaged in completing an old shell box order. The woods labor situation since the last report has not improved. Mr. S. C. Thompson, manager of the company, reports that the car situation is the worst the company has ever experienced. It has ten million feet in orders tied up.

The Hawkesbury Lumber Company reports that the woods labor situation has not improved. Its camps are established, but are not filled.

The Estate James Davidson is having difficulty in securing labor for both its mill and woods operations. It has a large shell box contract under way. The price offered for mill labor for shell box work is $2.50 per day. The first order for doors that this plant has received for many months came in Monday, November 5. It was a carload order from the Maritime Provinces. This plant reports a decrease in the demand for building materials.

St. John Markets—Uncertainty Prevails

St. John, N.B., Nov. 7—(Special to the Canada Lumberman).—The same feeling of uncertainty prevails in the market at St. John as elsewhere; no one is able to pierce the gloom and tell what the future may bring forth. As far as the business of cutting logs is concerned one has no trouble to look into the future and at least guess what the cost of the log will be. As the season advances men are becoming more scarce, and wages are gradually advancing. Instead of being a question of how much you will pay woodsmen a month the problem now is where to find them.

The St. John River being a boundary river, a good many operators having mills in New Brunswick cut their logs in Maine, and the United States and Dominion officials in the immigration departments are very careful to see that no men are going into the woods who are fit for service abroad; also, the laws are very costly for getting Canadians into United States lumber camps. Unless more men are found to man the camps there will certainly be at least a 25 per cent. shortage of logs on this river, and perhaps more. Besides this what logs are cut will cost at least one-third more when brought to market and sawn up.

The market for English deals is certainly flat. No offers are being made by the large buyers on this side of the water. They all claim that as they cannot forward the stock by boat it is useless to buy. If they do not come forward at once with a good offer for deals it is certain that the operator is not going to cut as many logs or make as great an effort to get them as if he were assured of a ready sale for his product.

It is said that a sale of over 50,000,000 feet has been put through on the North Shore of New Brunswick at or around $25 per thousand feet for deals sawn this summer, for the usual specification. While this is slightly better than prices of a year ago, it will not leave any profit whatever if deals for next year (1918) are to be sold at this price, as no one can tell at the moment the cost of the raw material. All log jobbers on the River St. John are going into the woods to get the logs as cheap as possible, but the buyer to pay the costs plus a commission for the log operators' winter's work.

Prices in the American market, while good, are not showing the same steadiness as two months ago. Very little house building is being done, and it does not look as if there will be much. The work calling for large dimension sizes is for framing shell and aeroplane factories and cantonments for the housing of United States troops. What next year may show for American prices is impossible to tell and it would only be a guess if one should make a price. At the present moment ordinary random is selling, f.o.b. St. John, 2 x 4, $24; 2 x 6, $25.50; 2 x 7, $26.50; 2 x 8, $27.50 to $28; 2 x 10, $29 to $30.

Merchantable boards are impossible to find, price is no object, $25 to $26 being paid, on cars at St. John for green spruce 1 x 3-4-5 and 6 ft. boards. Laths are a dead letter as far as American shipments are concerned. Locally $4 is being paid by the carpenters. The same conditions apply to cedar shingles, but shingles are scarce at St. John and are bringing higher prices than ever before for local work. Extras $4.70, Clears $4.30, 2nd Clears $3.35, Ex. No. 1 $2.20.

Locally no house building is being done and the factories are looking forward to a very slack winter, unless something unforseen arises. Only two mills are yet running at St. John. The winter port is now about to open and will call for many men. This will hamper the operation of the mills and cause them to close up about same time as a year ago, viz., about December 1.

Shipbuilding is going along very slowly, the work being held up by the non arrival of the big sizes of British Columbia fir and also for want of the larger sizes of birch from the local farmers, who do not care to get it at any price.

EDGINGS

Ontario

John Watson, lumberman, intends to install new machinery in his plant at Fergus, Ont.

W. Williamson, Toronto, Ont., is erecting a frame planing mill at 601 Woodbine Ave., to cost $3,500.

John A. McIntyre, Rodney, Ont., will probably commence rebuilding his planing mill, which was recently destroyed by fire, in the spring.

One of the main buildings of the Provincial Paper Mills at Georgetown, Ont., was recently destroyed by fire. The loss is estimated at $25,000, and is covered by insurance.

The Kinleith Paper Company, Welland Canal, St. Catharines, Ont., was recently destroyed by fire. The buildings were only partially destroyed and were covered by insurance.

The Eagle Lake Lumber Company, Limited, has been incorporated, with head office at South River, Ont., and capital stock of $40,000, to carry on business as general lumbermen. The provisional directors are S. R. Anderson, H. Mawson and W. C. Shreiner.

The Mingo Pulp, Paper and Land Company, Limited, has been incorporated, with head office at Toronto, and capital stock of $1,000,000. The solicitors for the company are Day, Ferguson & McDonald, Tanner-Gates Bldg., Toronto. Correspondence addressed to the company, care of the solicitors, will be forwarded.

The Canadian Allis-Chalmers Company, Limited, King and Simcoe Streets, Toronto, Ont., are repairing their shipyard at Bridgeburg, Ont. They have also started to put the old shipbuilding yards at Millers Bay into shape for building 3,000-ton steel ships. Four vessels are to be built. The superintendent of the plant is J. J. Scollan.

The Canadian Tie & Lumber Company, Limited, has been incorporated, with head office at Toronto, Ont., and capital stock of $150,000, to carry on a general tie, timber and lumber business, including the logging, sawing, manufacturing, shipping, buying and selling of lumber, wood, timber, pulp, etc. Among those interested are W. A. J. Case, J. B. Taylor and M. Smith, all of Toronto.

The Peterboro Lumber Co., Ltd., Peterboro, Ont., report that their recent loss by fire was partially covered by insurance, which has been satisfactorily adjusted. The company have already commenced rebuilding. The new plant will be larger than the old one and it is expected that it will be completed by December 1st. The fire happened at an extremely busy time when the company was running its mill night and day, but they report that arrangements were promptly made for another mill to take care of its unfilled orders and also to handle new ones.

Eastern Canada

F. E. Lovell, Lumberman, Coaticook, P.Q., has been registered.

Capt. Howard Corkum, Mahone, N.S., is having a large tern schooner built at Mahone.

The Canada Steamship Lines, Limited, 9 Victoria Square, Montreal, P.Q., are erecting two buildings at Cap de la Madeleine, P.Q., at a cost of $100,000.

The Industrial Bureau of Canada, Limited, has been incorporated, with capital stock of $49,000, and head office at Montreal, P.Q., to carry on business as manufacturers of lumber, timber, logs, pulpwood, etc.

Fire recently destroyed the lumber plant belonging to John E. Moore & Company, Limited, 71 Dock Street, St. John, N.B. The manufacturing plant was totally destroyed. The loss is estimated at $100,000.

Mr. James Buchanan, trading as the James Buchanan Lumber Company, has commenced business as a wholesale lumber dealer at 233 Coristine Building, Montreal. He will specialize on mahogany and veneers.

The Davidson Lumber Company, La Have Street, Bridgewater, N.S., are contemplating the erection of a new general office building. At present the company are negotiating for the purchase of the property. The building will be of concrete construction.

With a capital of $25,000, the Stoneham Woodlands Corporation, Limited, has been formed to carry on business in lumber, timber, pulpwood, and paper, both buying, selling and manufacturing; to purchase timber limits, operate sawmills, and own and maintain poles and transmission lines for the distribution of electric power in a limited district. The head office is in Quebec City.

The Montreal Shipbuilders Ltd., has been incorporated, with head office at Montreal, and capital stock of $300,000, to purchase, contract for, build, etc., steamships, sailing vessels and other vessels of all kinds. Among those interested are E. M. Mcdougall, S. C. Demers and L. G. Bell, all of the city of Montreal.

William Rutherford and Sons Company, Limited, Montreal, have obtained the contract for the millwork and lumber for the hospital to be erected at St.

Anne de Bellevue, P.Q., for the Military Hospitals Commission. The contract is an exceptionally large one, the series of buildings being mainly of frame construction. The general contractors are E. G. M. Cape & Company, Limited, Montreal.

Work on a new industry that promises to become one of the most important on the Miramichi River, was started at Nordin, N.B., early this month, when workmen commenced remodelling the mill formerly owned by the Rosebank Lumber Company and installing machinery for the International Shipbuilding Corporation. The intention of the company is, at first, to erect wooden ships, for which there is at the present a great demand, and it is expected that the keel of the first one will be laid in a very short time. This industry will have its head office at Newcastle, N.B., and will employ many skilled and unskilled men. The site selected for the works is an ideal one, about two miles below Newcastle. The mill, which is one of the best on the Miramichi will be utilized to provide lumber both for finishing and rough work. J. Ander, of Newcastle, and F. H. McNaught, of Chatham, N.B., are among the promoters of the new company.

Western Canada

The North-West Lumber Company, Limited, Edmonton, Alta., has increased its capital stock from $500,000 to $1,000,000.

The Burnt Mountain Lumber Company, Limited, has been incorporated, with head office at Edmonton, Alta., and capital stock of $18,000.

The Atlas Lumber Company recently lost their warehouse and lumber yards at Lougheed, Alta., by fire. The loss is estimated at $15,000.

The sash and door factory belonging to the Cranbrook Sash and Door Company, Limited, Cranbrook, B.C., was recently destroyed by fire. The loss is estimated at $40,000.

The Adanac Lumber Company, Limited, has been incorporated, with head office at Vancouver, B. C., and capital stock of $10,000, to carry on business as foresters, loggers, timber merchants, shingle mill, planing mill and sawmill proprietors, etc.

The Premier Lumber Company, Limited, has been incorporated, with head office at Vancouver, B.C., and capital stock of $10,000, to carry on business as manufacturers of and dealers in lumber and shingles, shingle-mill and sawmill owners, loggers and lumber and shingle merchants.

Sealed tenders are being received by the Minister of Lands for B. C. until the 4th day of December 4th, 1917, for the purchase of License X1138, to cut 1,270,000 feet of cedar poles, hemlock, white pine and spruce, and 30,000 lineal feet of cedar poles on an area adjoining Lot 3213, Robertson Creek, Kootenay District. Two years will be allowed for the removal of the timber. Further particulars may be received from the Chief Forester, Victoria, B.C.

Quebec Culler's Report

The following comparative statement of timber, measured and culled to date, is furnished by the Quebec Supervisor of Cullers' Office, under date of November 6:

	1915. Cubic feet.	1916. Cubic feet.	1917. Cubic feet.
Waney white pine	399,280	143,400	91,440
Oak	110,120	336,240	115,680
Elm	46,840	72.160	117,360

Birch and maple	48,880	46,880	15,880
Pitch pine	.....	.....	41,230
Fir	.....	.....	36,490

Death of William Williamson of Montreal

After an illness of five weeks, Mr. William Williamson, president of the Laurentian Lumber Company, Montreal, died in the Royal Victoria Hospital, on November 1, aged 61. Mr. Williamson was injured in a railway accident at Piedmont, P.Q., on February 5 last, sustaining a fracture of the skull, besides other injuries. He never wholly recovered from the effects of the accident. After being in business as a general merchant at Point Fortune, P.Q., Mr. Williamson started as a wholesale lumber merchant at the same place. Later he formed a partnership with the late Mr. Duncan Morrison, under the style of Williamson & Morrison, with mills at L'Orignal, Ont., and with offices in Montreal. Seventeen years ago the Laurentian Lumber Company, Limited, was formed, and on the death of Mr. Morrison, Mr. Williamson devoted his attention to this company, of which he was the president from the commencement. The company at one time owned mills at Montford and other points, but lately the manufacturing branch was given up. Mr. Williamson was formerly connected with the Argenteuil Rangers, now the Duke of York Hussars, in which he held a captaincy. The interment took place at Point Fortune on November 5.

Ship Construction in the U. S.

1,036 Vessels Under Way with Total Tonnage of 5,924,700 Tons

The Emergency Fleet Corporation of the United States has discontinued the publication of information regarding the production of vessels. A statement issued by the corporation on September 26, however, contains some interesting information.

During the past two months, the statement says, the Emergency Fleet Corporation has awarded contracts for 118 wooden vessels of 3,500 tons dead-weight capacity, each to 27 different shipyards.

There had previously been awarded contracts for 235 wooden vessels of similar type to the above, and for 58 vessels of composite construction, thereby making a total award to date of 411 wooden and composite vessels, of an aggregate dead-weight tonnage of 1,460,900.

During the past two months the designs for machinery have been completed for the manufacture of engines, boilers, and other articles of equipment for these vessels, for which the facilities available of machine shops and boiler works throughout the country have been used. Specifications have been prepared and negotiations outlined and initiated for the assembly and installation of machinery in wooden vessels, the most of which have been or are being constructed as "hulls only." Great difficulty has been experienced on the Atlantic Coast in obtaining suitable lumber for these ships, and it is anticipated that there will be greater delay in their completion than was expected when this movement was begun, notwithstanding every possible effort on the part of the corporation and its contractors.

Since August 1 there have been awarded contracts for 155 steel cargo vessels of 1,076,800 tons dead-weight tonnage, distributed among six shipyards.

Previous to August 1 seventy steel cargo vessels, of 587,000 tons total dead-weight capacity, had been contracted for. These vessels were distributed among ten shipyards. Therefore, at the present time the total number of steel vessels under construction for the United States is 225, with a total aggregate dead-weight tonnage of 1,663,800.

Summary

There were under construction for the Emergency Fleet Corporation on September 26:

Number and type of vessel.	Total dead-weight. Tonnage.
353 wood	1,253,900
58 composite	207.000
225 steel	1,663,800
400 requisitioned vessels	2,800,000
1,036	5,924,700

In addition to the above, Congress, in a pending bill, is authorizing the construction of additional vessels whose total dead-weight capacity will be nearly 5,000,000 tons. Plans for the major portion of these additional vessels are now in course of preparation, and many of them will be of special types adapted to particular necessities of war, and, while substantially cargo carriers, will have much greater speed than the cargo vessels now under construction.

Industrial Service Department

The Fleet Corporation has instituted an industrial service department, which, by co-operation with the Department of Labor, is undertaking to assist shipbuilders and others in the employment of suitable labor and to indicate an extensive system of vocational training, with the purpose of adapting allied trades and unskilled labor for service in shipyards, and, through co-operation with the Y.M.C.A. organization throughout the United States, to give attention to the housing and personal affairs of the men recruited for shipbuilding work.

With the passage of this bill the Congress will have authorized $1,984,000,000 for the Shipping Board and the Emergency Fleet Corporation.

Wooden Ships Under Construction in Canada

The Department of Marine, Ottawa, furnishes the following list of wooden vessels under construction in Canada during the month of August, 1917. This list does not include any vessels being built for the Department of the Naval Service or for the Imperial Munitions Board:

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9 ft. wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. BRAZEL PLOWS cut 6 in. wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road, leaving a clean roadbed. Roll up and push entirely away from the road, 18 inches of loose snow each time the plow passes over.

Wooden Shipbuilding in South

Busy Yards on Gulf and Atlantic Coasts Turn Out Ship a Day for Transatlantic Work

Thirty thousand men at 40 shipyards along the Gulf and Atlantic coasts of the United States are now rushing to completion 250 hulls for ships which will compose the initial unit of Uncle Sam's great wooden fleet to "bridge the ocean."

Seven to eight months after construction was begun, many of these ships will be ready for sea, and from that time on the United States Government will be able to add to the Allies' ocean tonnage, as long as needed, a new wooden ship of 3,000 to 3,500 tons capacity for every working day in the year. This is in addition to almost as many other wooden ships being built for private interests.

New yards are springing up at many points to meet the requirements of the United States Shipping Board, which has announced its determination to build all the ships of both wood and steel than can be produced during the period of the war.

Four hundred million feet of southern pine timbers will be needed within the next twelve months to complete the government's wooden shipbuilding programme.

Shipyards Hum on Wooden Hulls Along Gulf Coast

It took a world war to make the South a shipbuilding section, but when the word was given, the result surpassed the wonderful things which Aladdin performed by rubbing his magic lamp. A year ago a large vessel had not been constructed south of Newport News. Now the total shipbuilding under way in the South from Baltimore to Galveston amounts to $370,000,000, of which $90,000,000 is being built at the Newport News yards and $280,000,000 in new shipbuilding yards which have been developed in the last ten months, and most of them within the last five months.

It is in the rush work of building wooden ships that the South is furnishing its big bit in the world fight to preserve democracy. Altogether 298 wooden ships and 119 steel vessels are in course of construction in the South. The toonage of steel vessels will be 734,650 tons, and the cost $150,000,000, while the tonnage of the wooden vessels will be 861,400 tons and the cost $130,000,000. Added to this is the sum of $30,000,000 being spent by the government on the construction of battleships, cruisers and other war vessels in the Newport News yards. As an economic proposition the fact that two and one-half times as many wooden vessels, with 135,000 tons greater capacity, can be built at $20,000,000 less cost furnishes a splendid illustration.

Jahncke Yards Busy

At Madisonville, La., the Jahncke Shipbuilding Company is working rapidly on four wooden ships, and planning for building a large number. At Slidell, La., the Salem Shipbuilding Company's plant is noisy with work. At Slidell, on December 31 last, one of the first large ships ever constructed in the South was launched.

The number of wooden ships under actual construction at Orange, Texas, is twenty-one, of a total of 75,100 tons. Three plants there also have under construction thirty-five additional ships with a capacity of 139,500 tons. Cost of vessels now under construction is $7,510,000, and of the additional thirty-five contracted for $13,915,000. One of the ships constructed at Orange already has reached a European port with a cargo, she having made 16 knots an hour during a part of her voyage. Half a dozen companies are engaged in the work of shipbuilding, while many other ventures are being talked of. Almost 500 men are employed in the different yards, giving a payroll of $75,000 a week. It will require more than two years to complete all contracts now in hand. The activities at Orange are all on the Louisiana side of the Sabine River.

Pascagoula Active Center

Pascagoula, Miss., which for years has been one of the busiest lumber manufacturing places in the world, has sprung rapidly into a wooden shipbulding center.

The Henry Piaggio Shipbuilding Company, which is engaged in building vessels at Orange, is also developing plants at Gulfport and Moss Point, Miss., in the immediate vicinity of Pascagoula. It has procured a site at Moss Point, 1,600 by 720 feet, water front, and is building ten sets of ways.

The L. N. Dantzler Lumber Company, which has immense sawmills at Moss Point, has constructed a shipyard to build ships for its own use, at a point on the East Pascagoula River, about half a mile south of the Escatawpa River, at Griffin's point. It is laying the keels of three vessels of 1,250 and 1,500 tons, and has put to work 300 additional men.

The City of Gulfport Shipbuilding Company has been organized with a capital of $200,000. Henry Piaggio is also interested in it. The

WOOD BROKERS

FOR EVERY CLASS OF TIMBER

***Head Office:* HULL, England**

To the Lumber Companies of Canada:

You have the Goods. Place your Lists with full particulars in our hands. We are in daily touch with all the Buyers in the United Kingdom.

PLEASE NOTE.—We pay cash against all documents, and take the whole of the Delcredere risk on Buyers.

Install a KRAFT SODA MILL

CANADA has another big war opportunity: Great Britain needs more wood pulp. Install a small Soda Pulp Plant and Supply this need by converting your Slats, Tops, Bottoms and waste wood around the Saw Mill into pulp. We can dispose of any amount. Previous sources of supply in Sweden, etc., have recently been withdrawn and Canada now has a free field in Great Britain to market unlimited quantities of wood pulp. We can arrange contracts for long periods.
The cost of installing plant is small and you make a sure profit from waste material.

company is planning for the construction of a number of wooden ships, and has obtained a site for its plant.

Lake Charles Gets in Line

At Lake Charles and Morgan City, La., preparations also are being made for extensive shipbuilding, and with expected contracts these two towns may be busy constructing a dozen vessels in the next few months.

The City of Gulfport Shipbuilding Company at Gulfport has contracts for four 2,300-ton steamships and one 2,000-ton schooner. It will give employment to 1,000 men.

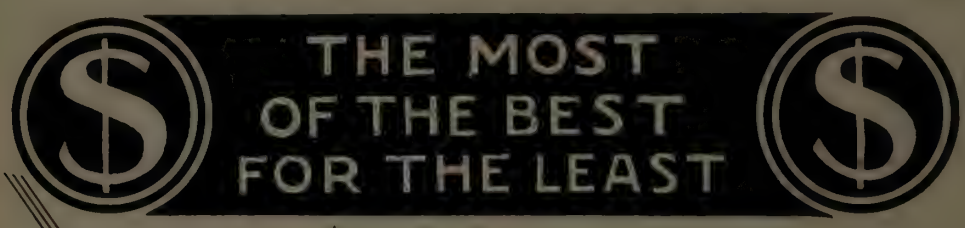
Mobile, Ala., is quite active in the shipbuilding line, and there has been talk of many shipbuilding ventures there. The Alabama Dry Dock and Shipbuilding Company is enlarging its various departments and is laying off two new yards for construction. Locomotive cranes and tracks are being installed. In addition to proceeding with plans for constructing an 8,000-ton dry dock, this company has accepted contracts for the building of four mine sweepers and two 3,500-ton full-rigged ships for a Philadelphia concern. One 500-ton schooner is now nearing completion on the stays. Rapid progress is being made on the four submarine chasers being built by the Barrett Shipbuilding Company of Mobile. The Murnan Shipbuilding Company also is making progress, having recently completed a 1,000-ton marine way. A runway for a locomotive traveling crane is also being constructed.

That the South is not seeking excess profits out of the necessity of hurriedly building a merchant marine was shown in the action of the lumbermen who, through the Southern Pine Association, accepted contracts for Southern pine timbers at $35, which was ten dollars a thousand feet under the market. The government has since voluntarily advanced the price paid for ship timbers to $40 a thousand feet, after an investigation into the cost of manufacture.

Why Shipbuilding Has Revived

A cable from London to the Toronto Star recently said: Winning the war is absolutely dependent upon the ability of the shipyards of Great Britain and the United States and Canada to turn out merchant tonnage quickly. As to this, I find the highest shipping authorities absolutely agreed. One of the best informed told me to-day that the position would be better realized by fixing attention upon the minimum that must be done month by month, rather than by promulgating elaborate paper estimates of what may be accomplished or not accomplished in a year. "Moreover," he said, "we have but to glance at the British, French, and Italian published reports about the sinkings to grasp the fact that the weekly average of the allied losses continues at twenty vessels, average 5,000 tons each. This means that to keep ahead of the game the allies must launch at least thirty such vessels, totaling approximately 150,000 tons a week. This, in turn, means that the shipyards of Great Britain and the United States, in friendly rivalry, must manage to complete practically 8,000,000 merchant tonnage within thirteen months. Many factors necessitate this 50 per cent. margin of safety. Not merely the shortage of British dock labor for loading, but the necessity of conveying merchantmen of different speeds in groups reduces the number of round trips of which the faster ships are capable. A well-informed writer in the Daily Telegraph points out that the British shipyards' output in a normal peace year had reached 2,000,000 of merchant tonnage in addition to the heavy naval demands, but that under war conditions it was not likely that they would be able to exceed Lord Curzon's recent estimate of 3,000,000 tons within a year. This leaves approximately 5,000,000 tons as the minimum for which the allies will be dependent on the American shipyards. While this may seem to be a large order, I have no doubt that the nation which emerged from the Civil War with a mercantile marine greater than Britain's, not to mention the ironclads, an American invention which was the precursor of a modern steel battleship, will rise to the present occasion in a way that will surprise the world."

During the past seven years the firm of J. Ernst & Son, Ltd., Mahone Bay, N.S., who are extensive dealers in West India products, have turned out about thirty vessels, principally fishing schooners. This summer the firm built a 400-ton three-masted schooner, and are now engaged on an up-to-date fishing schooner. When this is completed they will start upon another large schooner. The company recently was formed into a joint stock company in order to carry on business more extensively. The vessel launched by this firm on July 18 was a handsome tern schooner named the "Jean Dundonald Duff." Her dimensions are: Keel, 111 feet; breadth, 32 feet; depth of hold, 12 ft. 6 in. She measured 404 tons gross and 345 tons register. Her first cargo was taken on at Bridgewater for Madeira.



THE ABOVE SUMS UP, IN A FEW WORDS, THE SERVICE WE ARE PREPARED TO GIVE YOU IN REGARD TO CAMP SUPPLIES.

Ask us to quote you on any or all of the following lines:—

Mince Meat, Jams and Jellies, Worcestershire Sauce, Eggs and Egg Products, Butter, Cheese, Raisins, Currants, Drained Peel, Figs, Maple and Table Syrups, Milk Powder, Condensed Milk, Baking Powder, Flavoring Extracts, etc., etc.

USE LOGGING MACHINERY

IN PLACE OF MEN

After the tree is cut down, then comes the expensive process of getting the logs to the mill.
Much of this expense can be saved, and at the same time the work done easier and quicker by the use of Marsh & Henthorn

Hauling or Skidding Engines and Loading Engines

We make the right size and style Engine for your camp, whether your output is large or small

Our booklet "Suggestions to Lumbermen," describes many expense saving methods of handling logs with inexpensive outfits. If you have not received your copy yet, drop us a card
Our experts are at your service also. Let us help you to save money in getting out your season's cut

MARSH & HENTHORN, Limited, BELLEVILLE, Ont.

GOODHUE BELTING For Saw and Planing Mills

In a Goodhue Belt you get only the best leather with the stretch taken out of it. A Goodhue Belt will always run evenly and "clings" to the pulley transmitting 100% of your power

For the wet places in the mill we have a special waterproof leather belt—"Acme." Other Goodhue Belts are "Extra" and "Standard" recommended according to the conditions under which the belt has to run.

Goodhue Belts stretch less than any other belt by 15 to 25 per cent.

Send for prices and particulars

FISHER & DAVIS MFG. CO. St. Louis, Mo.

Insure your horses against sickness

Why not? You protect your mills against fire by installing fire-fighting apparatus; you protect your employees against accident by the use of machinery guards—then why not protect the health and efficiency of your horses? And how? By keeping in your stables a good supply of Dr. Stewart's Veterinary Remedies.

It may be the means of saving the life of many good horses, and will keep them sound and vigorous at all times.

A LIST OF DR. STEWART'S VETERINARY REMEDIES

Stewart's Sure Cure (antiseptic gall cure) the original, in liquid form, 16 oz. bottles	$9.00	doz.
Stewart's Excelsior Liniment, 32 oz. bottles	9.00	"

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

The "Little Giant" Truck

Model 15 — 1 Ton

The Little Giant is without doubt the most logical motor truck for your business.

Highly standardized—perfectly equipped — built to withstand maximum wear and tear — this car stands for real delivery efficiency.

Note in particular the exclusive feature which will save you 50 per cent. in fuel.

Special Features

Timken Worm Drive

YOU NEED "LITTLE DAVID"
FOR WOODEN SHIPBUILDING
— MORE WORK AND LESS WORRY —

The "Little David" Wood Borer is the "Shipbuilders' Wood Boring Machine," because it is light, powerful and speedy, and above all, simple and durable.

It is made in three sizes, the smallest boring holes in wood 1″ diameter and under, and the largest, 4″ diameter and under.

All sizes are reversible, and the cases are of aluminum with steel bushed cylinders. This explains why the largest size is about ten pounds lighter than any other wood borer of equal capacity.

We have other labor-savers for wooden ship work, such as the CC-101 Drift Bolt Driver, Pneumatic Hammers adapted for trenail driving, and Pneumatic Tools for horsing oakum, etc.

Our nearest branch will be glad to give you full information, and to send bulletins, etc., at any time.

WHOLESALE LUMBER

Eastern Spruce
Hemlock
Pine
Shingles and Lath

Shipment by car, canal boat or cargo.

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

Douglas Fir
Red Cedar Shingles
Hard Pine
Maple Floors

We manufacture Spruce at our own Mills at Portage, Maine, U. S. A., and therefore we know what big prices mean to the manufacturer

11 Broadway, NEW YORK, N.Y., U. S. A.
126 State Street, BOSTON, MASS.
Western Office: Lumberman's Bank Bldg., Portland, Ore.

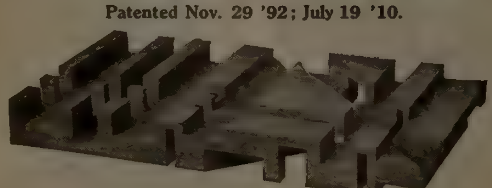
Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

Patented Nov. 29 '92; July 19 '10.



Grooves Cut with Huther Bros. Dado Heads

Fits Any Saw Mandrel

A Huther Bros. Dado Head consists of two outside cutters and enough inside cutters to make the required cut. This Head will cut perfect grooves, with or across grain, any width. It is an easy Head to keep in perfect condition, has a simple quick adjustment, and may be enlarged any time after purchase. Sent on approval and if not satisfactory return at our expense.

Write for New Illustrated Catalog.

HUTHER BROS. SAW MFG. COMPANY, Inc.

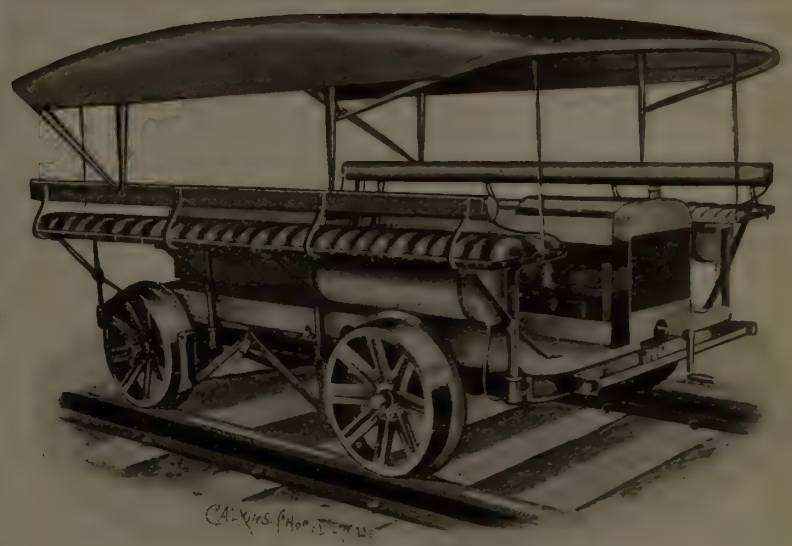
NATIONAL Railway Motor CARS



For Passenger Service

We recommend this car highly for lumber companies operating a short line railway, as it is an ideal car for light passenger service, or tractor for hauling supplies, moving crews, etc. Frame is of 3 x 1⅜ x ⅝ channel steel; axles 1⅛ inches with Hyatt roller bearings; 20 inch pressed steel wheels of extra strength. Four cylinder, four cycle, water cooled, 10-12 h. p. engine, equipped with Atwater-Kent ignition system, float feed carburetor with throttle and spark control, and kerosene attachment. We also equip the car with friction drive as it gives a variation of speed and power. Reverses by shifting friction wheel over center on the disc, and runs in either direction equally as well. Seats are nicely upholstered, with lazy backs; folding top with jiffy side and end curtains. The car is a complete job that will cut operating expenses in quarter.

Price Complete $600.00 F.O.B. Factory.—If interested write us for complete descriptive matter or place order direct from this ad. 4L

Northwestern Motor Co., 1500 Spring Street Eau Claire, Wis.

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at $26,774,937 or 40% of Canada's total output.

Pine production,	905,442,000 ft. B.M.
Pulpwood,	246,282 cords.
Railway Ties,	5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.
For maps and full information regarding Ontario, apply to

HON. G. HOWARD FERGUSON,
Minister of Lands, Forests and Mines.

The Time to
Buy Timber
is when prices are low and on the upward turn.

Now!

When the end of the war is being discussed and all lumber commodity values are expected to increase—that is

Now!

When general conditions are such that it is evident to all that averages will never again, never, be as low as they are

Now!

And, of course, the way to buy is through us, with the safeguards of our resources, knowledge and 37 years' experience.

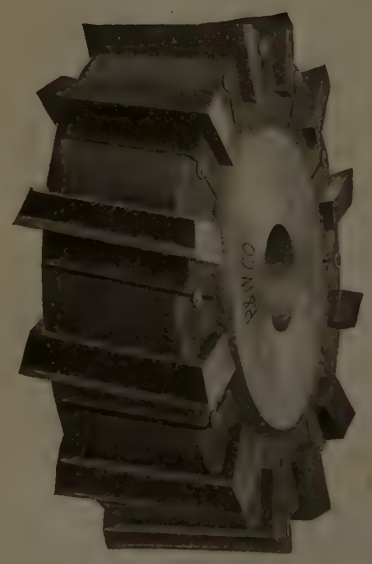
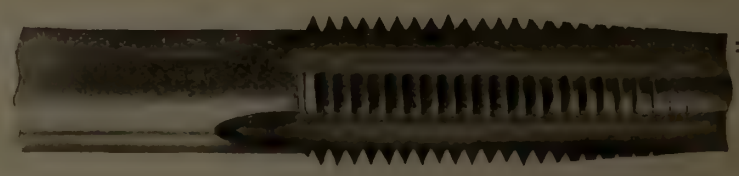
Perfection in Commercial Tools



Milling Cutter Section



The Exclusive "Con-Eccentric" Relief

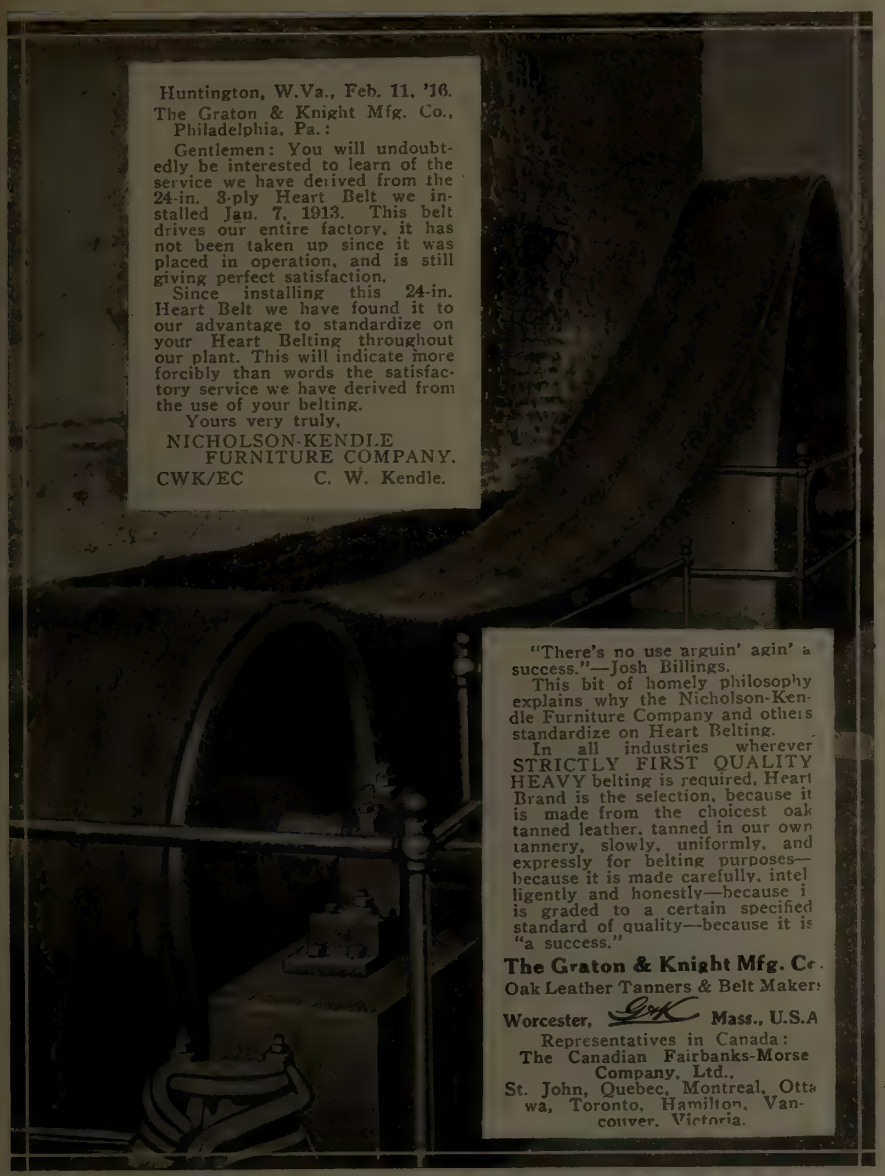
The methods used by the Pratt & Whitney Co. insure considerably greater accuracy and durability than has heretofore been possible to obtain in a commercial tool.

This achievement in workmanship may be had in TAPS, DIES, MILLING, CUTTERS, REAMERS, PUNCHES, DRILLS, Etc.

It will repay you to look for the "P. & W. Co." mark.

Write for Catalogue—It explains the many exclusive features of these SUPERIOR TOOLS.

PRATT & WHITNEY COMPANY
DUNDAS OF CANADA ONTARIO



Don't Blame the

FIRE BRICK

if it fails to give satisfaction. More likely than not you have been using the wrong kind for your particular purpose. A firebrick intended for use in a small hand-fired boiler may not give the same result if used under high pressure boiler with mechanical stoker.

So when sending us your enquiries be sure to specify for what purpose these brick are to be used.

You are sure then of a high quality brick, that is absolutely the best for your purpose.

We Manufacture the Following Well Known Brands

"Elkco Special," "Elk Steel," "St. Marys," "Keystone" and "Rotex"

Saw Gumming is an All Important Job

And the success of this job in many a saw mill depends upon

Aloxite Saw Gumming Wheels

For the reason that they cut cool and clean and fast, even when forced to the limit—and they hold their shape—show long life.

There is nothing superior to Aloxite for steel grinding—it is hard, sharp and of just the right degree of toughness and Aloxite Saw Gumming wheels are

The Right Wheels in the Right Place

Suppose you let Carborundum service help you to better grinding service.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

This illustrates our **No. 5 PORTABLE SAW MILL,** just the thing to work up a small pocket of timber or for an out-of-the-way location.

IMMEDIATE DELIVERY

We have in stock a Right Hand Saw Frame and Carriage, also a set of track timbers, as shown in the above cut (except that they are the opposite hand). Other items in stock at Orillia include :---

No 1. Log Jack with foot wheel and idlers.
No 7. Log Jack " " "
10" x 36 ft. Steam Feed.
10" x 42 ft. Steam Feed—Either feed can be furnished with vertical or horizontal valves.
Double acting set works in No. 1, 2, and 3 sizes.

We also have a second-hand plain slide valve engine, right hand, side crank, 9x13, suitable for a small saw mill plant. This is a good bargain and can be shipped immediately.

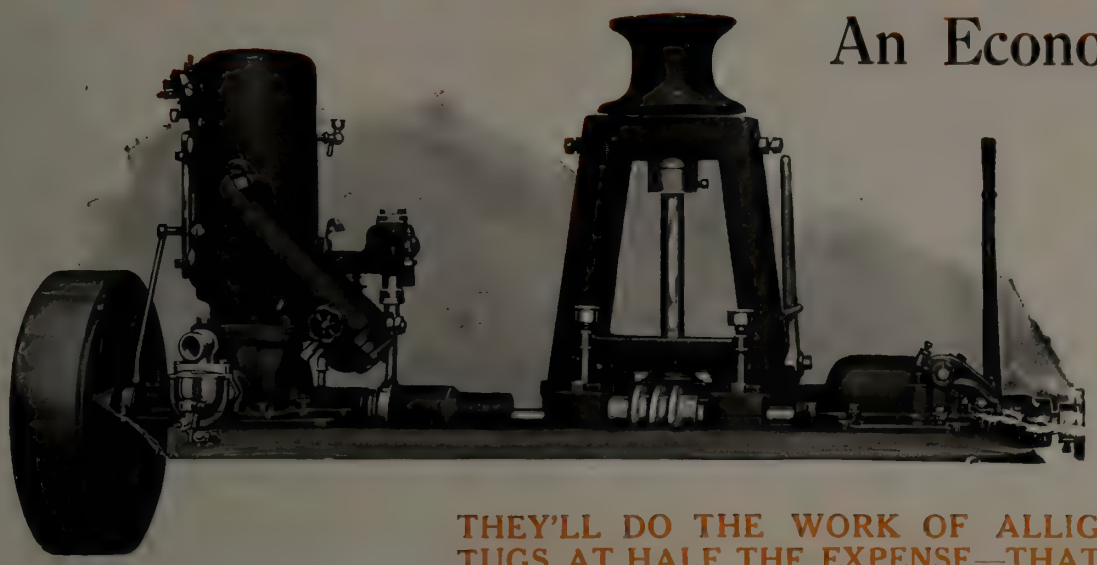
Adams Pointers

An Economy Combination



A rigid little craft with a powerful sturdy engine

THEY'LL DO THE WORK OF ALLIGATORS AND TUGS AT HALF THE EXPENSE—THAT'S ECONOMY

Adams Pointers have been chosen by leading lumber manufacturers and driving companies because of their superior construction and exceptional economical features.

It will indeed pay you to investigate the merits of this craft; also the remarkable engine which has been so instrumental in the success of Adams Pointers.

ADAMS ENGINE COMPANY, PENETANG, ONT.

J. T. PAYETTE, Prop.

128,350 Laths in 10 Hours--That's Service

This Lath-Mill and Bolter has beyond doubt demonstrated its worth,--service, durability and moderate maintenance cost; especially in the test cut, 128,350 4 ft. laths 1½ in. by ⅜ in., counted, tied and piled in ten hours.

The same dependable construction is embodied in all our other lines of Lath-Mill and Picket-Mill Machinery. Suitable for large and small concerns.

A Few of the "400" who use Payette's Lath-Machinery:

Your Profits

Where do they come from?

WELL, do you employ labor? Yes! Then there is just one source—your employees' labor.

Now—if your employees lose any of the time you pay for, the loss must come out of your net profits—not out of your raw material cost—not out of your factory burden—nor from any source but your Profits.

This must surely impress you with the vital importance of getting all the working time you buy, just as you insist on getting all the raw material you pay for.

If, say, 100 men in a factory lose only one minute each "arrival" and "departure" daily, it means 22 minutes per week, or 2200 minutes for these employees. This is 37 hours per week—at say 40c.—meaning lost time of $14.87 weekly or $770.00 in the year—out of your net profits. Pretty stiff price for doing without a time recording equipment—and we have not touched on production loss.

There is a modern and reliable method of mechanically checking each employee's time, which stops this leak. It is our business to stop "time leaks." In thousands of cases we have plugged them tight, by having the original Pay Roll Entry printed, and printed by the employee himself.

We make every kind of time recording device. WE MAKE THEM IN CANADA, saving you 25% to 42%, which is the duty on imported goods.

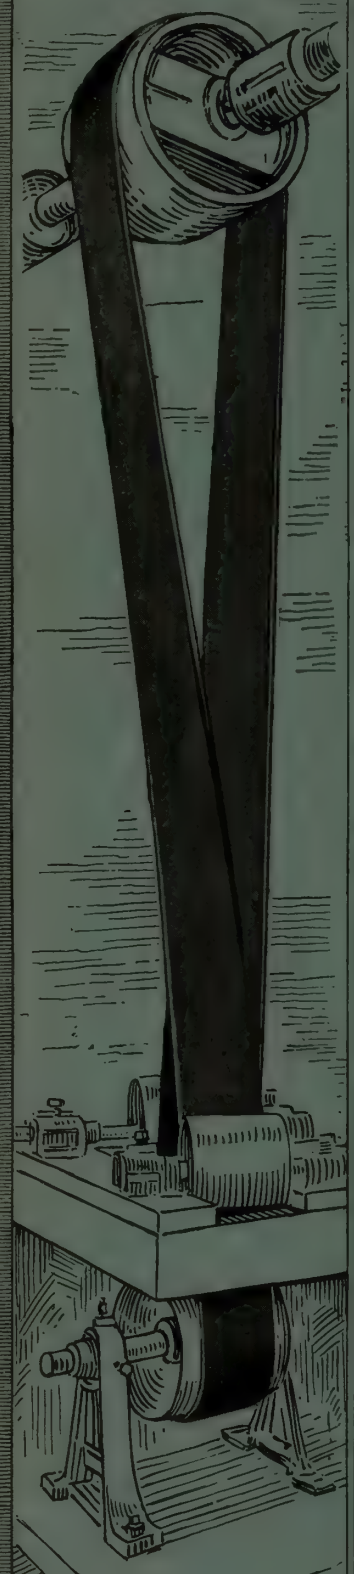
Standardized Series

LEATHER BELTING

Tanned by us for belting use



A Belting Catechism

What are the Advantages of Leather as belting?

Leather is the standard belting material. When properly tanned for belting, its surface will grip the pulley in the most effective manner. Good leather belting is economical and reliable. It will transmit power with 98 per cent. efficiency.

How can leather belting be made uniform?

The manufacturer must first set up definite standards of quality—and strictly adhere to them. As he cannot secure belting leather in the open market of uniform quality, he must tan his own hides. He must tan them in sufficient quantity to enable him to select for each belt, pieces up to his standard. These pieces must be uniform in weight, stretch, texture, and quality.

Why should belts be rigidly graded?

A belt is no stronger than its poorest part. The quality of leather varies, and unless each belt is carefully graded, dissimilar qualities get into the same belt. Rigid grading is uniformity. Grading should be done by expert judges of belt leather quality, according to fixed standards.

Why is there such confusion in leather belting grades?

Because many belt makers have not standardized their belts, but give the buyer any kind of belt he demands. The result is chaotic.

What *is* Standardized Leather Belting?

Simply belting that is standardized to meet the needs of the different classes of power transmission—instead of being made to meet theoretical specifications. Transmission requirements can be classified into a comparatively few groups, and there is a standardized belt to fit each one. Standardization **can** be applied to belting just as to any other type of machine part or product. It is common sense in belting.

How does Standardized Leather Belting help the belt buyer?

It insures the selection of the proper belt required to speed up machines, to maintain production, to reduce operating expenses, which cannot be accomplished unless the belt user gets the maximum power through his belts. Standardized leather belting effects this for him and enables him to **know** that he is getting the right brand for highest efficiency and greatest economy—maximum service from every belt and every drive.

How does it work?

Let a Graton & Knight representative make an analysis of your belting requirements. Then get the standardized belt for your work, ordering your belting by work to be done rather than by specification. There is no obligation—there may be a great saving for you.

PETRIE'S
DECEMBER LIST
of
NEW and USED
WOOD TOOLS
for Immediate Delivery

Band Saws
54" Cochrane-Bly re-saw.
28" Ballantine, bracket.
26" Crescent pedestal.

Saw Tables
No. 2 Crescent, combination.
No. 3 Crescent universal cut-off gauge.
No. 5 Crescent, sliding tor
Ballantine variable power feed.
No. 257 Berlin power feed rip.
Fisher, iron frame rip
12' Defiance automatic cut-off.
MacGregor Gourlay power feed cut-off
Greenlee automatic cross-cut.
Champion combination wood top.
Canadian steel frame pole saw.
6½' Williams wood frame swing.
5½' Crescent swing (2).
8' Crescent swing.

Planers
30" Whitney pattern single surfacer (2).
26" double surfacer.
24" Jackson-Cochrane.
24" Champion planer and matcher.
No. 202 Canada Machinery Corp., timber sizer.

Sanders
24" Fay double drum.
18" Crescent disk and drum.
12" Canada Mach. Corp.

Moulders
13" Clark-Demill four side.
12" Cowan four side.
12" Woods, four-side, inside.
10" Houston four side.
8" Dundas, four-side.
6" Cowan four side.
6" Dundas sash sticker.

Mortisers
M190 Cowan hollow chisel.
Galt upright, compound table.
No. 2 Smart foot power.
No. 5 New Britain chain.

Clothespin Machinery
Humphrey No. 8 giant slab re-saw.
Humphrey gang slitter.
Humphrey cylinder cutting-off machine
Humphrey automatic lathes (6).
Humphrey double slotters (4).

Miscellaneous
Elliot universal woodworker.
MacGregor Gourlay 12 spindle dovetailer.
Fay & Egan 12 spindle dovetailer.
M80 Cowan dowel machine.
No. 1 Ballantine dowel machine.
Crescent post boring machine.
M137 Cowan sash clamp.
Egan sash and door tenoner.
Dundas double head tenon machine
18" Trevor box heading turner.
3" Pringle & Brodie variety lathe.
No. 221 Woods planer knife sharpener.
No. 4A Fox wood trimmer.
20" American wood scraper.
4-head rounding machine.
MacGregor Gourlay 2 spindle shaper.
M63 Cowan spindle carver.
Iron frame 3-block sawmill.
Dougherty horizontal shingle machine.
26" Dominion lath trimmer.
Waterous lath machine.
No. 2 Dominion lath machine and bolter.
48" 3-saw edger.
No. 1 Hart automatic saw filer.
No. 104 Covel band-saw roller.
No. 66 Hamilton band-saw sharpener.
No. 6 Covel band-saw swedge.
No. 21 Covel filing lamp.
Defiance automatic handle shapers.
24" Cochrane-Bly saw filer.
Defiance rounding, boring and jointing machine.
18" leveling block.

The Corbet Automatic Double Cylinder Steam Towing Machine

Made in four sizes, accommodating Flexible Steel Hawsers from ¾-in. dia. up to 1½-in. dia.

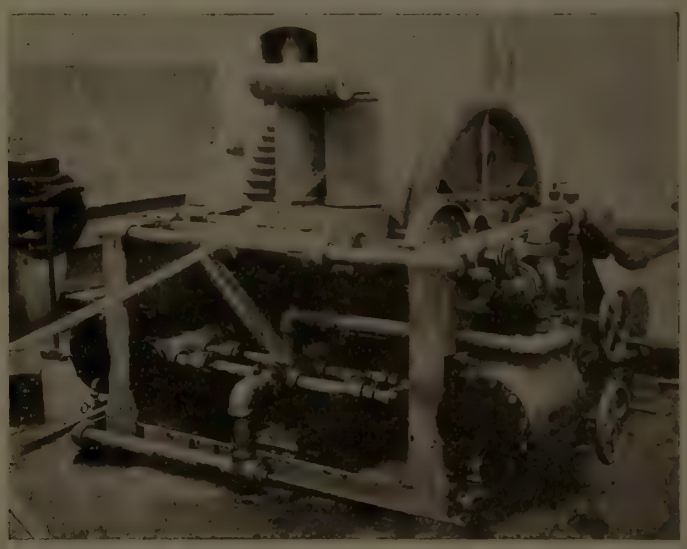
A large number of our machines are installed on Tugs on the Atlantic and Pacific Coasts and on the Great Lakes.

They increase the efficiency and earning power of the Tug.

Does away with having to buy new Manilla Towing Hawsers every spring.

The Steel Hawser will last at least 10 years.

Keeps the crew contented and gives perfect satisfaction.



Read what one of our Customers says.

"TESTIMONIAL"

THE MIDLAND TRANSPORTATION CO.,
Midland, Ontario.

Messrs. The Corbet Foundry and Machine Co., Ltd., Owen Sound, Ontario:

Dear Sirs,—I have pleasure in reporting to you that the No. 3 Automatic Steam Towing Machine, which has 1,350 ft. of 1¼-in. dia. Flexible Steel Hawser on it, which you installed on the tug "Lucknow" this spring, has been satisfactory in every way. The machine has sufficient power to haul the cable in at all times while the tug is working ahead. The Automatic Valve works well when in bad weather, and we find no jerk on the cable. This machine is a big improvement and safer than the Manilla line.

Yours truly,
THE MIDLAND TRANSPORTATION CO.,

"CC-15" Drift Bolt Driver with telescopic air-feed extension leg, for up-driving.

This tool arranged with cross handle for down driving will be shown in next issue.

Time Counts in Construction Work—
Use Pneumatic Tools and Save Time

AIR TOOLS for driving drift bolts, treenails, spikes, etc., in wooden ship building, dock and general construction work, have come to stay, because they **reduce costs and hasten completion**. Time never counted for as much in these classes of work as it does to-day.

The Drift Bolt Driver shown in the cut is intended for updriving. It will send home a drift bolt five feet long, 1⅜" diameter, with 1/16" drift, in hard wood, in 25 seconds.

For down driving, the feed leg is replaced by a cross handle. Two men usually handle this tool, and on some classes of work can accomplish as much in one day as was formerly done in three by hand.

Other labor-savers are "Little David" Wood Borers, "Little David" Portable Saws, "Little David" Spike Drivers, Bolt Clinchers, etc. Let us tell you what can be done with these tools. Our nearest Branch Office will be glad to advise you regarding them, and to give you figures for complete Pneumatic Equipment.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 37 Toronto, December 1, 1917 No. 23

Ontario Wholesalers Organizing

The proposal of the wholesale lumbermen of Toronto to form an association for the development of their mutual interests is one of the most important steps that have been taken by the trade. The manner in which the proposal has been taken up indicates that there is a necessity for an association and that it will be supported strongly. At the meeting held on November 16th to discuss the matter, the wholesalers of Toronto and manufacturers who carry on a carload trade were represented almost to a man, and a number of the larger firms had several representatives present. The discussion showed that there was a unanimous feeling in favor of organizing without delay, and a number of practical suggestions were made regarding the scope of the association's work.

It was urged by several of the speakers at the meeting that the association should not be confined to Toronto firms but should cover the whole province, and it is probable that this will be the nature of the association when it is formed. At the outset it may be that the composition of the association will be largely made up of Toronto firms, as they are so situated as to be able to do most of the preliminary work conveniently, but the success of such an association will depend greatly upon the extent of the co-operation secured from all parts of the province. Letters received from a number of the firms at other points already indicate that the co-operation of wholesalers generally can be expected.

There should be no need for arguing about the value of such an association, as the work done and the results secured by other associations both in Canada and the United States give sufficient indication of the benefits to be derived. At the Toronto meeting the speakers dwelt chiefly upon two features: the better understanding developed by organization, and the exchange of essential information regarding credits. There are, however, many other ways in which the usefulness of an aggressive wholesale lumbermen's association can be developed. In looking after matters relating to legislation, transportation, grading and inspection, terms of sale, etc., and in providing an official means of settling disputes between members of the lumber trade in general, there is a wide field of usefulness, and, as an association of this nature grows, numerous other methods of promoting the interests of its members will develop. It is, in short, only a matter of getting such an organization started with a representative and enthusiastic membership. The rest is a matter of utilizing the opportunities presented.

The foundation stone of an organization of this nature is confidence in one another. Without it there is nothing to be gained. With it, the boundaries of usefulness are almost unlimited. There is among the Ontario wholesalers today a much more fraternal spirit than was the case a few years ago. If any proof of this were needed it was afforded by the geniality and comradeship which prevailed at the meeting on November 16th. A pleasanter meeting could not have been devised, and it was clearly evident from the first that there already existed among the members of the trade that element of mutual esteem and friendliness that are essential to successful co-operation. The two chief speakers of the meeting were happily indicative of the broad scope of its possibilities and their addresses outlined both its practical possibilities and its social or personal advantages. Mr. A. E. Clark, chairman of the meeting, representing chiefly the hardwood trade, pointed out a number of ways in which the association would be of practical assistance to the trade, and Mr. A. C. Manbert, representing one of the most extensive firms dealing in softwoods chiefly, spoke both of the practical business side of the work and the social and friendly side. Mr. Manbert's remarks impressed forcibly upon those present the value of developing a feeling of friendly confidence and comradeship among wholesalers so that they might approach one another without hesitation in order to discuss the intimate and important features of their business, upon which so much of its success depends. Some years ago, when coming first to Toronto, Mr. Manbert, knowing of the valuable work done in United States cities by similar associations was disappointed in finding nothing of the same nature here, and his investigation of the trade at that time led him to the conclusion that there did not then exist a basis upon which to form one. Since that time, however, there has been a steady increase of good fellowship among the members of the trade in Ontario and there is now good reason to expect that such an organization can be made a success.

Good fellowship is the first essential of this proposition, but, by itself, will not keep an association together. Practical services for protection of credits and for dealing with transportation, legislation, etc., must be planned and put into effect from the outset. An association holding only a few meetings annually and an annual meeting and banquet might just as well not exist. Those who are taking an interest in the new proposition among the wholesalers are well convinced of this and are planning for an association of a distinctly business type, which will, in all probability, involve a fairly large membership fee, but will render in return services many times more valuable than the cost.

At an early date another meeting will be held, when a draft constitution and by-laws will be submitted by the committee appointed for this purpose, after which it is expected that actual organization will be effected.

Socks Wanted for Forestry Battalions

The Canadian Lumbermen's Association have received word that the men who have gone oversees from Canada in the various forestry battalions are in urgent need of socks, and the association is taking steps to relieve the want in this direction. The assistance of all lumbermen in Canada is requested. The president and executiive committee of the association, and the secretary of the Canadian Forestry Association discussed the matter thoroughly and decided to do everything they could to gather a sufficient number of socks to send over to the forestry battalions. The requirements of the battalions amount to 10,000 pairs of socks. The forestry battalions receive the regular issue of socks, but the conditions under which they work make it important that they should have a couple of extra pairs for each man.

The Canadian Lumbermen's Association has requested the Canada

Lumberman to give as much publicity to this matter as possible, and we are much pleased to be able to refer to it, feeling sure that the readers of the Canada Lumberman will respond readily and furnish the association with means to purchase an ample supply of socks to send forward at an early date. The forestry battalions are naturally of special interest to all lumbermen. Many of the officers and men enlisted in this work are known personally to our readers and the class of work they are doing in Great Britain and France is so closely similar to the operations of lumbermen in Canada that we feel sure that an appeal of this nature will find a ready response. The lumber industry has already done a great deal to furnish raw material for a large number of war requirements. Its record is indeed an enviable one and the forestry battalions which have gone overseas may be considered a personal representation of the Canadian lumber industry. We know that lumbermen in all parts of Canada have followed their work closely and taken a personal pride in the reports of the excellent results that have been obtained by these battalions. Had it not been for the ready response of these men to the call of Great Britain and France, our armies in the field would have been seriously handicapped by the want of suitable timbers for their engineering works, trenches, dugouts, etc.

The work of the forestry battalions is not of a striking or impressive nature. It is one of those quiet lines of activity going on far behind the lines, and sometimes quite close to the lines, upon which the life and progress of the army depend. It is, in fact, one of the most essential lines of work in connection with the progress of a modern army. The lumber industry of Canada can feel, therefore, that its representatives in the forestry battalion are playing an exceptionally important part in the successful carrying on of the war. The forestry service is thus one of the many non-combatant services which, combined with others, are going to win the war. Therefore, it is a definite duty on the part of lubmermen in Canada to see that these men are well looked after in regard to their personal comforts, and we feel sure that this duty will be readily accepted. It is not the idea to ask for any contribution of socks direct, but for money contributions only.

In order that the work may be done efficiently and satisfactorily to all who are interested, it has been decided that remittances may be made payable to the order of R. G. Cameron, Honorary Treasurer of the Canadian Lumbermen's Association, and addressed to him at Room 16, Castle Building, Ottawa. The Canadian Forestry Association is notifying all its members of the sock campaign, by means of notices in the Canadian Forestry Journal, and the publicity thus obtained, together with the efforts of the Canadian Lumbermen's Association are counted upon to produce sufficient subscriptions to obtain a large supply of socks at an early date.

We hope that readers of the Canada Lumberman will lose no time in doing their share of this important and patriotic work.

The Portable House Export Trade

In an editorial in the November 1st issue of the Canada Lumberman reference was made to the possibilities of the portable house trade with France, with a view to interesting Canadian firms which ought to share in this business. According to a letter received from a prominent business man, important orders for houses have lately been placed in the United States. Canadian firms have not obtained any such business.

With a view to getting closer at the facts of the situation, the Canada Lumberman recently interviewed Mr. Frank Pauze, of the U. Pauze & Son Company, Montreal. Mr. Pauze was a member of the special trade commission appointed in 1916 by the Canadian government to visit Great Britain, France and Italy in order to make enquiries and report upon the possibilities of developing trade between those countries and Canada. As a lumberman, he was interested particularly in the lumber side of the enquiry, and particularly in the question of supplying portable houses. To this end an exhibition of Canadian houses of various types was given in Paris.

Mr. Pauze states that the report of the commission was intended to be placed before a national convention of the various trades interested, to be called by Sir George Foster, but so far as he has learned, nothing has been done in this direction.

Mr. Pauze visited the devastated regions in France in order to investigate the possibilities of trade in portable houses. In this regard he says: "One of the principal questions is whether the people will be willing to go back to the towns and villages which have been ruined. There is no doubt that the French Government is convinced that the people will want to return, and if this be correct they will certainly require a large number of houses. For the moment, however, the subject is not a live one in France, owing to the many things connected with the war which occupy the mind of the government.

"Another vital question is that of transportation. How can we ship the houses with the present limited amount of tonnage at our disposal? This is a difficulty which will have to be faced in considering whether Canada can do business in this direction.

"I am also convinced that the French people will buy from outside sources only when it is apparent that they cannot build the houses themselves." Mr. Pauze is sceptical, to put it mildly, as to the orders which are alleged to have been placed in the United States. There might be individual cases of houses having been ordered, but he doubted whether the French government has given any such orders. He has been in correspondence with a large United States firm on the subject of shipping houses to France and the answer he received was that the firm were not ready to do anything in that branch of trade. Mr. Pauze added that the prices of houses submitted by the commission to the French government compared well with those for which houses could be made in France, but since that date freights had very largely increased.

On February 17th last Mr. Pauze received a letter from a French firm stating that the latter had taken up with their government the question of importing these houses. The government, however, were not willing to buy from foreign corporations, even those of the allies, owing to the necessity of reducing every possible form of import and also owing to the question of exchange. Still, the business should be borne in mind, because, after the war, the objections referred to would have to be waived. The firm asked for quotations for one thousand houses, but as delivery would have to be made in a French port Mr. Pauze said that it was out of the question to continue negotiations. In September he received letters from France reporting the unwillingness of the French government to take up the matter.

Mr. Pauze evidently believes that while there may be opportunities for this trade after the war the immediate outlook is not bright. So far as he is able to learn, no steps have been taken by our own government in the direction of Canada supplying France with houses in the near future.

Uniform Terms of Sale for U. S. Trade

Lumber manufacturers and wholesalers in the United States are taking much interest in a campaign for the adoption of definite and uniform terms of sale. The National Lumber Manufacturers' Association, through a special committee, has drawn up recommendations upon this subject and the association is asking all its affiliated associations to adopt the terms of sale that are recommended. The recommendation is being submitted to all the affiliated organizations, on the understandiing that when 75 per cent. of them have adopted the proposed terms, they will become effective. The new terms are as follows:—

"This invoice, after deducting freight, is payable net by 60 days' acceptance from date of invoice, such settlement to be mailed within

15 days from date of invoice. If the car has not arrived, 90 per cent. of the net amount of the invoice must be settled for in the form of acceptance less estimated freight, the balance of approximately 10 per cent. to be settled for net within five days after arrival of the car, when at the same time freight bill shall be sent in as voucher for the amount of freight; or a cash discount of 1 per cent. on the net amount of invoice after deducting the freight, provided remittance is made within 15 days after the date of the invoice."

It will be noted that the new terms make definite use of what is known as a "trade acceptance," a form of written acknowledgement of debt which can be converted at will into cash. Some of the points in favor of the seller having accounts closed by trade acceptance within five days after the arrival of the car are as follows:—

1. The correctness of the account is expressly admitted by the buyer; the transaction is completed, for the acceptance in the hands of an innocent third party is not subject to the legal defenses usually set up by debtors unwilling to pay.

2. Unearned discounts, unwarranted return of goods and other abuses will be materially lessened if not entirely removed.

3. Economy and convenience in collecting accounts will be gained.

4. Manifestly, more accounts will be paid when due and losses on bad accounts greatly reduced.

5. The dead capital in book accounts will be transformed into self-liquidating commercial paper convertible at will into cash.

6. The need for working capital will be lessened, and consequently the ratio of earnings to capital actually employed will be increased.

7. Petty abuses will be eliminated. The friction which so frequently grows out of the deduction of unearned discount is removed and the temptation to take a few days' extra time is eliminated. The prompt receipt of invoice covering a correct charge is acknowledged. The house which allows a customer to take extra time or an unearned discount discriminates against its better class of trade, who pay, as agreed. "Time is money" and the buyer has no better right to pay less than agreed, than the seller has to demand more.

Mr. Edward Hines, of Chicago, discussing this proposal at a recent meeting of the Northern Hemlock and Hardwood Manufacturers' Association, said:—"The changed conditions that have taken place in the lumber industry, with the added costs that enter the finished product, have made a decided difference in the price per thousand which this discount amounts to. Going back, for example, a matter of ten years, where the average price of lumber at the mill would be $10, 2 per cent. discount would amount to 20 cents per thousand. Today this can be safely based on at least 100 per cent. higher, or a $20 average, which, at 2 per cent. commission, means 40 cents; and on this basis a concern handling 50,000,000 feet a year, is charging off at the end of the year to profit and loss, $20,000, when at least half of this represents an amount wrongfully deducted. The question of cash discount, he said, is simply and purely interest allowed for the prepayment of an account before it is due, to give the seller the use of the money in the meantime.

"Within the past year or two the cost of lumber has advanced greatly, as has also the cost of supplies, and these things are sold to us net. The average time taken by the buyer of lumber is equivalent to practically $1 per thousand during the year, not counting the time and effort in correspondence between the buyer and seller in trying to collect the account."

The Merits of Wooden Ships

The extensive programme of wooden shipbuilding carried on in Canada and the United States, many interesting details of which were given in the November 15th issue of the Canada Lumberman, is naturally to be accounted for to a very great extent by the urgency of the demand for tonnage of all descriptions. The operations now in progress, however, are bringing out facts in connection with wooden shipbuilding which were formerly overlooked to a great extent and which suggest the possibility that the construction of wooden vessels will continue to be an important industry long after the war is over. Just at present, the allied governments require anything they can get in the way of tonnage that can be utilized for the carrying of supplies across the ocean. There is a limit to the quantity of steel vessels that can be constructed, and wooden ships are being called upon to supplement steel ships as far as possible. The most favorable feature of the wooden ship programme is the fact that it makes use of an entirely different line of materials and a different class of labor from those which are used for the construction of steel vessels, and therefore does not in any way interfere with the steel ship industry. Wooden ships are generally built in yards that are not equipped for and could not handle steel ship-construction.

When the United States was confronted with the problem of increasing its production of ships it naturally turned first of all to wooden ship construction, because at that time, every existing yard capable of building steel ships was fully supplied with orders and was having difficulty in securing steel. Since that time conditions have been improved in connection with steel ship construction, but the United States Shipping Board still needs every woooden ship it can obtain and therefore is encouraging the wooden ship industry to the greatest possible extent. The demand for steel for a great number of materials that are essential to the war has also made it important to supplement the use of steel by other materials wherever this can be done.

Wood was probably the first material used in ship construction, and its use has continued for this purpose ever since. Compared with steel it has the following advantages:—It is cheaper and easier to work with; properly treated it lasts much longer in salt water and is less easily damaged by contact with bottom; it can be sheathed or painted with copper which prevents fouling by sea growth, thus permitting wooden ships to remain out of dry dock for a much longer time than steel ships.

The chief disadvantage of wood is the fact that its strength is much less than steel and therefore its use is confined to a smaller type of vessel than those that can be constructed of steel. This has proved a controlling factor for larger ships and has resulted in their being all built of steel, although steel had also been extensively used in the field of the smaller vessels.

Even before the war, however, ships of smaller size were often built of wood in preference to steel because of the advantages already mentioned. Particularly in cases where ships are liable to touch bottom it has been found that wooden ships are more serviceable, because the wood yields slightly and does not puncture so readily. The experience of the New Cape Cod Canal in this matter is striking. In the first two years of its existence, two steel ships were sunk in the canal by touching bottom, while no wooden ships met with this difficulty, in spite of the fact that there were many more wooden ships passing through the canal than steel ones.

From the point of view of economy, the wooden ship costs less to build and generally somewhat more to operate per dead weight ton of carrying capacity, because of the greater weight of the ship, which means that the carrying capacity for the given size of ship is smaller when built of wood than when built of steel. The insurance rating on wooden vessels is higher than on steel vessels because of the greater fire risk and the fact that wood is not so strong a material as steel. On the other hand, if properly cared for, a wooden vessel should outlast a steel vessel in salt water. There are today wooden ships in service that are over fifty years old. The trouble from dry rot which has sometimes caused wooden ships to deteriorate rapidly can be overcome by proper design and care.

Wooden ship construction has not yet been standardized, but has been largely carried out by an old "rule of thumb" methods, but even under these conditions construction of wooden ships is cheaper than steel. It is reasonable to expect that the standardization of wooden ship construction will make important reductions in its cost. The factory made house has now proved an economical structure and the factory made or standardized wooden ship is something that may be looked forward to in the near future. Altogether the outlook for long continued popularity for the wooden vessel in the years that follow the conclusion of peace, is encouraging.

Wholesalers Decide Upon Organization

Important Meeting at Toronto Favors an Association for Promotion of Mutual Interests —To Include all the Province—Credit Bureau Proposed

A meeting of wholesale lumbermen was held at the National Club, Toronto, on November 16th, for the purpose of discussing the advisability of forming an association representing wholesale lumbermen and those manufacturers who engage in the carload trade. The meeting was the result of a decision reached at a recent meeting of the Lumbermen's Section of the Toronto Board of Trade, at which the subject was discussed in a preliminary manner and the conclusion reached that a general meeting should be held in order that the subject might be debated more thoroughly. The preparations for the dinner which preceeded the meeting were carried out by a committee consisting of Messrs. A. E. Clark, chairman, C. W. Wilkinson, A. E. Eckardt, J. L. Campbell and H. J. Terry, who made all the necessary arrangements and were responsible for the large attendance and the successful manner in which the meeting was conducted.

Mr. A. E. Clark occupied the chair and, after the dinner had been concluded, opened the business meeting by laying before the 38 wholesalers and manufacturers present the ideas which those who were chiefly interested in the proposal had in mind. It had been the desire of the wholesalers of Toronto and many of the wholesalers in other parts of Ontario, for some years past, he said, to bring about some sort of a union among the members of the trade. They felt that the lumbermen as a unit could do a great deal more for their mutual benefit than they could do individually. Wholesalers had many difficulties to contend with and by getting together they could deal with them far more effectively than individually. The very fact that the wholesaler was sometimes considered to be a species of parasite was an argument in favor of getting together. There was no question whatever about the status of the wholesaler. He was not a parasite by any means, but an important and necessary trade factor and a legitimate element of the business life of the community. He went into channels which the manufacturer had never entered and could not possibly enter. It was utterly impossible for the manufacturer to break up his stock into dozens of items and distribute them about the country as the wholesaler did. The wholesaler was really the assistant of the manufacturer in a great many respects, a fact which they all realized very definitely about the first of December or the first of January, when the manufacturers called upon them for financial help.

The wholesaler's value to the trade as a go-between when difficulties arose between the purchaser and the seller was also of much importance. In settling these disputes and often carrying the brunt of the burden for both parties, the wholesaler performed a valuable service to the industry and the trade. It was not right to refer to the wholesaler as a list carrier. He did not take the list of the manufacturer, and mark $2 more upon it, walk out and sell it and take the profit. The wholesale business required good head work and it was time for the wholesalers to get together, both in Toronto and in Ontario generally. The object in calling the meeting was to secure the opinions of all the wholesalers present upon this proposal. Details would be left entirely in the hands of those present to work out for themselves.

The advantages of association work had recently been demonstrated forcibly in the United States. The government had called upon certain classes of producers of spruce, mahogany and other woods for large quantities of stock to be used in airplane construction. Mr. Clark had had no idea that so much clear spruce could be produced as was produced as a result of organization. In the State of Michigan, also, there had been a cantonment to be built at Battle Creek. The Michigan association sent to Washington an undertaking to take care of the lumber purchasing end of the work. They placed the order on the market and bought 4,210,978 feet from the Wisconsin association, in addition to what they secured from their own members. The cost of doing this was about 7½c per thousand feet, and this was assessed against the members who got the order. Without organization, such prompt and extensive results would not have been possible.

Some of the Wholesaler's Problems

Wholesalers had to consider well the question of their future difficulties, particularly those which would develop after the war. These were problems which no single wholesaler could work out for himself, but which a body of whosalers could deal with effectively and with good expectation of obtaining results of definite value. The question of cost of production in 1918 was one which would puzzle any single wholesaler to answer. As an association they would be able to analyze these difficulties and deal with them much more successfully than as individuals. Questions relating to transportation were cropping up every day in connection with which associated effort would be effective, but individual effort of little avail. These included such matters as increased freight rates and weights of cars. The problem of car weights was probably one of the most serious matters they had to deal with and united efforts in this direction would bring results. Men who were handling spruce, pine and basswood knew that it was very difficult to get 45,000 feet of lumber into an ordinary freight car. What could any single wholesaler do in obtaining a better condition of affairs in this regard? Practically nothing. If 38 of them got together, however, they would be able to show the railways the true situation in a very short time. He did not think they would have to fight the railways, but only to show them facts in a conclusive manner, in order to get fair treatment. There were many other questions to take up; an important one being the question of credits. It was part of the wholesaler's business to distribute credits cautiously and carefully. If they had a properly organized credit system in operation before the end of the war, they would be able to take care of their credit problems better than when the great change took place after the conclusion of peace.

Mr. Clark, at the conclusion of his remarks, invited the others present to discuss the subject. Several short addresses were made in approval of the suggestion to form an association, among the speakers being Messrs. Frank Oliver, W. W. Carter, C. W. Wilkinson, and John Barry.

Definite Result from Co-operation

Mr. H. J. Terry drew attention to the fact that a recent example of the value of being associated had been furnished by the case of an order issued by one of the railway companies in Toronto in connection with the payment of freight charges. A rather exacting circular had been sent to the trade, and the representative of the railway company had been invited by the Lumbermen's Section of the Toronto Board of Trade to attend one of their meetings and discuss the matter before it should be taken before the Board of Railway Commissioners. The immediate result was that the order was withdrawn. The lumbermen would not have been able to obtain this favorable result if they had each protested singly. Moreover, by getting together socially they were able to break down any barriers of personal misunderstanding which might exist between them, and thus could make their business relations much more pleasant.

Mr. John Donogh spoke briefly of the advantages of co-operation and concluded by moving "that in the opinion of the meeting it would be to the advantage of the wholesale lumbermen to form an association for mutual protection." The motion was seconded by H. G. McDermid, of the Union Lumber Company, and carried unanimously.

Mr. Donogh's motion was not taken as an indication that the discussion should close, but as providing something concrete to discuss, and several others contributed good short addresses.

Mr. A. C. Manbert, of Graves, Bigwood & Company, expressed his conviction that it was a fine thing for the lumbermen to get together and to become acquainted with one another intimately. He was pleased to have an opportunity of acknowledging the fine courtesy which he had received from the wholesalers of Toronto ever since coming to the city. These courtesies did much to relieve the weight of business affairs. One of the finest things about getting together was the fact that it removed the chance for misunderstanding and brought about that measure of co-operation which was so essential a feature of present day business. When he had first come to Toronto he had felt a bit lonesome and at once had begun to look around for an association that would take the place of some of the fraternal friendships he had enjoyed elsewhere—an association where members could exchange views and discuss market conditions and other matters that were of interest to them—and he was sorry to find that there was no such organization. Organizations of this type had been of great advantage to him in his former business experiences and he made considerable enquiry to see if there was not some basis upon which to form one in Toronto. He found, however, that there did not seem to be such a basis at that time. Since then, he had continually felt that if they could get together in some such manner as he had known the wholesalers to get together in Buffalo, Cleveland, Detroit and other United States cities it would be a distinct advantage to them.

The finest thing accomplished by the associations of which he had experience was in producing that measure of comradeship and understanding which enabled one man to go to another and ask him without reserve for his opinion about this or that man's credit or responsibility, or about any of the daily features that entered into the conduct of their business affairs. He was pleased to say that he had been able to develop a peculiarly happy intimacy with some of the

members of the trade, which enabled him to go into their offices and discuss these matters. It was really refreshing when you felt that you could do that sort of thing, because this kind of co-operative effort was the keynote of successful business today.

Friendliness and Goodfellowship Promoted

Public sentiment was against combination, and people who got together to exploit the consumer were very rightly and properly frowned upon. On the other hand, it was in the interests of society and business generally that business should be conducted upon a safe basis that would lead to prosperity, and how could this be brought about unless everybody based his business operations upon intelligent methods, such as could be best developed in co-operation between fellow business men? He had never believed in combination in the matter of price fixing. Price fixing brought about its own evil results immediately, because, when people were able to get together and combine, the ability to make use of power of this kind was very seldom exercised discriminately. But it did seem to him that an association of the kind that was under discussion could be practically helpful in many ways; first, in developing that friendliness and frankness which would enable any one of them to ask a question fairly and expect a fair answer; second, in bringing about that candor that was so necessary in connection with the matter of credits, which was the rock upon which they were going to get some hard bumps during the next few years unless they were able to steer clear of it; and third, in enabling them to get definite information upon matters relating to purchases and sales. He wished particularly to emphasize the matter of credits. They should be especially definite upon this proposition and should be prepared to bring about something constructively useful.

If they did nothing else, however, but get together once a month, as they had on this occasion and find out who was who, and meet one another socially in good fellowship, the effort would be praiseworthy and entirely worth while.

Short speeches were then made by Messrs. J. L. Campbell, Frank Oliver and C. W. Wilkinson. Mr. Oliver suggested that they should enquire into the feasibility of obtaining club quarters and establishing themselves definitely in some place where they could meet together.

Mr. Clark thought it would be best, in the first place, to carry out the details of organization before discussing any of the other features of the work.

Mr. Manbert expressed the opinion that they should definitely appoint a committee to prepare a constitution and by-laws to be laid before them at a future meeting in two or four weeks' time and he suggested the names of Messrs. A. E. Clark, C. W. Wilkinson, H. J. Terry and A. E. Eckardt to compose the committee. Mr. W. T. Egan seconded the motion and it was carried.

Credit Bureau Possibilities

Mr. Manbert again spoke briefly, in order to impress upon those present the importance of the matter of credits. A short time ago, he said, he had been asked to meet several other wholesalers to discuss the question of forming a wholesalers' credit bureau which ultimately should have some relation to the wholesalers' organization or to the interests of the lumbermen generally. He suggested that Mr. A. E. Eckardt, who had been one of the chief members of this committee should make a report upon its work in order to acquaint those present with what had been done, so that if it developed to their interest they could act upon it.

Mr. A. E. Clark explained that the Canadian Lumbermen's Association, a short time ago, had considered a proposal to form a credit bureau and had decided that it would be well to work it out locally at first. It had been discussed pretty fully and the conclusion had been reached that it might be worked out in some way in connection with such an organization of wholesalers as was now proposed. Mr. Clark then called upon Mr. Eckardt to speak about the credit bureau matter.

Mr. A. E. Eckardt referred in the first place to a few recent cases in which the lumbermen would have been able to promote their interests effectively if they had been organized into an association. In connection with business assessments, for instance, he called attention to the fact that theatres were assessed at 25 per cent. and departmental stores at 35 per cent., whereas the assessment on lumbermen was 50 per cent. The reason for this was probably found in the fact that when this legislation was put upon the statute book, the lumbermen as a body were not consulted. If they had an organization such as was proposed, all the bills affecting their interests would be watched carefully when they came before the House. In connection with railway freight rates also they were urgently in need of united effort if their interests were to be preserved.

Referring to the credit bureau, Mr. Eckardt outlined the work of the retail credit bureau formed in Toronto a few years ago. For ten years previous to the formation of this Bureau the aggregate average losses of the members composing it had been about $17,000 annually. Since the formation of the Bureau, he believed he was safe in saying, the annual losses had been brought down to less than $2,000. This fact alone must be a great benefit to the wholesalers, as the retailers were just that much better customers when their losses were reduced.

Short speeches were delivered also by J. P. Johnson, who discussed the importance of establishing rules of inspection for lumber; H. A. Leak, A. Read, John A. McBean, R. G. Chesbro, Chas. Plant, P. J. McCormack and W. J. Hetherington, all of whom expressed their approval of the proposal.

At the suggestion of the chairman a list was obtained of the signatures of those present who would join in the formation of an association. The signatures obtained represented 23 firms. It is expected that the co-operation of the few remaining firms in the city will be readily obtained and that a number of firms in other parts of the province will also be eager to join.

Votes of thanks were passed to the chairman and to Mr. C. W. Wilkinson for securing the use of the Albany Club. The meeting then adjourned, it being understood that as soon as the committee on constitution and by-laws is able to report, another meeting will be held.

Will Woodsmen be Exempted?

Information received from many manufacturing points in Ontario emphasizes the great scarcity of labor now prevailing, and the high wages that are being paid. Unquestionably the output during the coming winter will be much reduced. Operators are anxious to learn whether their woodsmen will be exempted from conscription. Up to date there is no sign of the tribunals exempting bushmen because of the importance of their work from a military point of view.

It is quite probable that the heads of the large lumbering and paper manufacturing concerns in the Ottawa Valley district will apply either for exemption from the draft for some of their men or at least for an extension of time covering the winter bush operations for all those who are eligible to be called to the colors on December 10. This is made necessary by the acute shortage of labor. Unless this concession is made by the government and no steps are taken by the military authorities to oppose the applications for exemption to the local tribunals, it will mean a great reduction in the cut.

Could Furnish Unlimited Airplane Spruce

The urgency of the demand for airplane spruce for the Allies and the great efforts that are being made to secure a sufficient supply have brought to light the fact that while there is a plentiful supply of standing timber of this class in British Columbia there is a shortage of available manufactured stock. Getting the logs to the mills seems to be one of the chief difficulties. On this subject, Mr. W. E. Williams, Secretary of J. R. Morgan, Limited, Prince Rupert, B. C., writes as follows:—"We are operating on Graham Island, the largest of the Queen Charlotte Group, about 80 miles west of Prince Rupert, B.C. There is unlimited airplane spruce timber available, and we would be prepared upon two months' notice, to put any reasonable quantity of it into the water, Graham Island, up to from 3,000,000 feet to 10,000,000 feet per month. But the difficulty at the present time is that there are no large sea-going tugs available for towing these logs in Davis rafts from Graham Island to the coast mills. There are, however, suitable tugs in British Columbia, but these are owned and are operating in the vicinity of Vancouver, and are under contracts which render them unavailable to any private concern in Northern British Columbia. If the government will only give a contract over a period of one year, and step in and provide for the delivering of these logs to the various sawmills, the necessary airplane spruce lumber will be forthcoming.

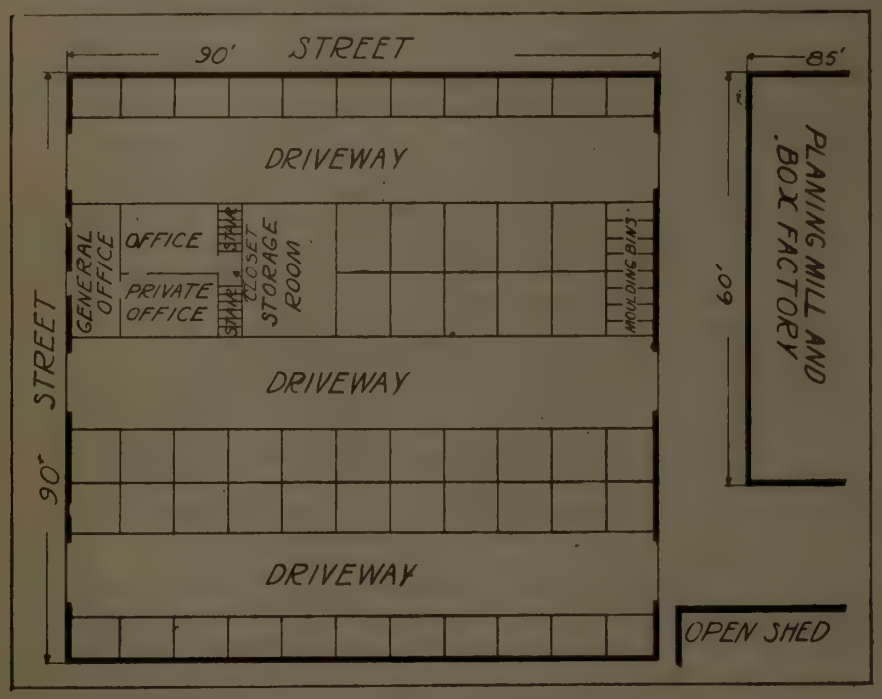
France Requests Offers from Manufacturers

United States Commercial Attache C. W. A. Veditz, of Paris, France, on September 15 transmitted a report to the Bureau of Foreign and Domestic Commerce at Washington in which he said that the French Minister of the Interior has decided to arrange immediately for the manufacture of numerous articles intended for the use of the population of those regions of France from which the enemy has recently been expelled. With this object in view, he has requested offers from manufacturers and dealers capable of furnishing the required goods. These competitive offers will then be examined and important purchases made on behalf of the government. Bids are asked for immediately for the manufacture of 20,000 wooden bed frames, in forty lots of 500 each, each manufacturer being allowed to bid upon five lots; for the manufacture of 10,000 school desks with seats, in twenty lots of 500 each, each manufacturer being permitted to bid on a maximum of five lots; for 10,000 cement sinks, with auxiliary parts. Further bids will be invited later for other lines of goods required by the population of the territory formerly invaded.

Modern Retail Storage Facilities

New Shed Erected by D. C. Baird at St. Marys, Ont., Provides for End Piling of Large Quantity of Stock

The planing mill and box factory operated by D. C. Baird at St. Marys, Ont., is well known to the wholesale lumbermen of the province. Mr. Baird is one of the most progressive retailers in Ontario and it is not surprising, therefore, that he has lately made improve-



ments in his equipment and facilities which are of the most modern type. The accompanying illustrations give an idea of the large lumber storage shed which Mr. Baird erected this summer. Retailers will be interested in a description of this shed.

The chief feature of the shed is the fact that it provides for end piling of lumber. By adopting this method of housing his stock, Mr. Baird claims that he is able to eliminate a great deal of waste of lumber, and also that it results in an important saving of time, as one man can handle practically as much lumber under this system as three men can handle otherwise. He also reports that he secures an extensive reduction in the cost of insurance. These three factors are of sufficient importance to attract any retail lumberman and to make it worth his while to look into the advantages of this method of storage.

The lumber storage shed erected by Mr. Baird is located at the corner of Church and Station Streets, St. Marys. It is 90 ft. x 90 ft., and adjoins the planing mill and box factory. The shed has a capacity of 500,000 feet of lumber. The outside walls are 18 feet high. All the frame work is built of 2-inch plank spiked together. Cement walls have been constructed under all the outside walls and cross walls. The outside of the building is finished with galvanized clapboard siding.

The shed is laid out with three driveways, each 14 feet wide, the entrance to which is at the main entrance to the shed. These driveways run through the whole length of the shed and on to the planing mill, so that lumber can be readily trucked into the mill. The driveways are on the same level as the plank flooring underneath the lumber piling spaces. The building is laid out in bents. Each piling space is 8 ft. wide and 7 ft. deep and there are a number of small bins for mouldings. Storage room is provided over the office for stocks of doors, sash, etc. The office is at the main entrance of the storage shed and is 20 ft. x 20 ft. It consists of a public office, private office and accountant's office, and is finished throughout in British Columbia fir, with panels of rotary cut fir, finished with an oak stain. The ceiling is finished in natural color. The office is heated by electricity.

New storage shed erected by D. C. Baird at St. Marys, Ont.

Planning Trade During Fall and Winter

In an issue of a farm paper I have happened to notice an advertisement put out by the Curtis Companies that is worth studying, says a writer in the American Lumberman. This concern has been a leader in advertising service and in helping the retailer give his customers what they have always wanted but have never been able to visualize. This full-page ad. was inserted to sell Curtis woodwork, but it was also intended to help the local retailer do the selling. But that is not the most interesting thing about the ad. The attractiveness and the honest directness are things the local board vender could study and imitate in his own newspaper publicity.

The whole page is of such a character that the casual reader in turning the pages would stop and look it over. At the top is a drawing of a house. This drawing is so made as to give a person a good idea of the size, style, and plan of the house, but the picture is a good deal more than the hard, repellent line drawing that architects seem to favor. There is atmosphere in it. There are flowers and shrubbery in the front lawn, and there is a background of trees and clouds that make a perfect setting for the house. The observer doesn't think of it as a house, but rather as a home. Then in the corners, on each side of this picture, are plans of the first and second floors. In a lower corner is a drawing of the living-room and dining-room, showing a fireplace and a colonnade and built-in bookcases. The furniture is in place, and the rooms have a lived-in appearance. The pictures prepare the reader for the opening statement: "We can help you build a better home." Following this the advertisement makes these statements: "Fear of costs keeps families from building beautiful, elegantly finished homes, with every comfort and convenience. Yet this fear of cost is largely due to lack of information, just as most all fears are. A request on a postal card will bring you a Home Book of Plans, absolutely free. From its pages you may select a comfortable, well-designed home, a home full of conveniences—yet a home costing no more than you want to spend." And so on.

"Notice how often the word "home" appears. This ad. is an appeal to people who want homes, and that is about all of us. It meets immediately the primary objection to building—that is, the prohibitive costs. Suppose some person with a latent desire to own a home, but who has always dismissed the idea as impracticable, happens to see this ad. He is interested. He says to himself that it will cost only a cent and a couple of minutes to get that book of plans. He obeys the impulse and thereby begins his education in the art of home-planning. The chances are good that, sooner or later, he will build a house, and when he does he will ask for Curtis woodwork.

I am not trying to boost the Curtis Companies. What I am doing is calling attention to an advertisement that has much of value to the local retailer in the way of ad. construction. Attraction by compelling illustrations and straight-forward statement and the promise of further help in planning a new house or a new interior—these are the things that give this bit of publicity its pulling power. After the person is interested enough to make enquiries it is up to the lumberman's salesmanship to complete the deal.

Pigs and Prosperity

This autumn season is a time of briskness, so they tell us. Sometimes it is and sometimes it isn't. Last night I heard a story of a Frenchman who was employed to cut some wood. He was a good axeman, but his axe had the usual vice of getting dull. He tried to sharpen it with a whetstone, a miserable task as every chopper of experience will testify. Finally he got provoked to speech, and among other things said: "The worst thing to have around the place is no grindstone." Just why this speech was attributd to a Frenchman instead of an Irishman we don't know unless perchance it really was said by a Frenchman. It has all the marks of a synthetic Irish story. Maybe the worst thing to have around the place is no grindstone, but we are entering as one of the worst the lack of briskness in a brisk season. However, other things being equal, this autumn weather has enough sparkle and kick in it to make the laziest of us sit up and sniff. Some of us will be out on the stubble-fields with the dogs, which will be good things for us and maybe not so extra hard on the birds either. Others will be pushing the business along a little harder. I saw a statement the other day to the effect that the best way to arrange the year's program of work was to do the big jobs in the spring and fall with some work and a dash of play in summer and a long, quiet time in winter, with plenty of reading and catching up with the thinkings and doings of the outside world. This fits the general pulsation of our business in the spring and fall, whether we want to or not.

It is up to us, then, to do a little extra shoving at this time. The general volume of business will improve, though by this time farmers

are pretty well through with their fall building. But what we lack in farm trade we will make up in that intensive building that comes in the fall and is hurried through in advance of winter. Most of the fall bills are sold, and have only to be delivered. The new business will be largely odds and ends, with maybe a house or two that came into the market because of a fire or a will. Among the odds and ends are a good many things of use to the customer and profit to the dealer. In the copy of the farm journal I mentioned before is a picture of a portable hog-house made for the raising of fall pigs. It may be a little late for these things, but the chances are good that those farmers who raise fall pigs and who have not supplied themselves with similar shelters will be interested. The same portage houses can be used in the spring. These houses are mounted on fir runners so they can be moved about easily. They measure 6 by 8 feet on the ground, have a gable roof, measure 2 feet in height, or more if desired, at the eaves, and have the roof arranged so that two sections that are hinged like doors will fold back and allow the sun to shine through a couple of window sash set just below them. These houses can be built for from $20 to $25. If treated with preservatives or kept well painted they should last for years. The design was made by the agricultural engineering and animal husbandry sections of the Iowa Experiment Station, and is described in its bulletin No. 152. The station may be addressed at Ames, Iowa.

Since these houses can be used in the spring, the building of them may serve as a winter occupation for the yard men. If the yard has some place that can be made comfortable to work in during the winter and will install a universal woodworking machine, a profitable little side line may be developed. Nearly any intelligent yard-man can learn to operate one of the machines, and, after he has made one or two of the houses, he would find it easy to put them together quite rapidly. Prudence would lead a retailer not to plunge on manufacture until he was rather sure of a comfortable margin of sales. They are subjected to exposure and more or less rough usage, so it might not be a bad advertising idea to treat the material, particularly the floor and the frame, with creosote oil. Then a couple of coats of paint would give the outside a finished appearance and would also contribute to their lasting qualities.

We all of us get engrossed in business sometimes until presently, if we don't let up and take an interest in something else, our families inform us that as a companion and playmate we are as successful as a fretful polekitty. We may say we are going to mix work and play as we go along, but the betting is good that at some time or other we have to let everything else go by the boards and sit up close to business. The slack time in winter is useful in getting reacquainted with the things we have had to pass up. It is a good time to get a new perspective on the town.

A Good Time to Read About Business

And then the winter is a good time to do some reading about business. There are good books on advertising and salesmanship and other phases of business. They can tell us about the fundamental principles of business; and some of these things will sound so plain and obvious that we will wonder why we hadn't thought of them ourselves. But, in any event, the man who is serious about his work will find time to read about it. He will not have to force himself to do this unless it be at first, when he is getting used to it. If he is really in earnest about his business he will find or make opportunity to read books that will fit him to do it better.

And now, especially, is the time to plan about the stuff we are going to induce our customers to read. Winter is the time for lumbermen to get busy with their educational advertising. It is a shallow view of advertising that regards it as being of value merely announcing to the public that we have in a new car of shingles. Nobody cares whether we have a car of shingles or not. But they do care very much when they are shown how to put on a roof tha will last a long time. They probably know we carry lumber, lime, and cement, so we can't tell them anything new along that line. But they are not convinced that they themselves can afford new barns. The best argument in such a case is no argument at all. The clever salesmen allows the goods to sell themselves. After the customer has had the desire for a thing planted in his mind the salesman can go over the arguments that show how he can afford it. So a goodly part of the winter's advertising ought to be directed toward showing people desirable goods. One dealer I know does this by means of plan books he has prepared. It can be done in other ways. But it is important that the customers be thinking of building. You may be sure that your catalogue rivals are not letting the winter go by unused. If by a consistent campaign—even a modest one—conducted through the newspapers you can induce some people to remodel or to build new houses or barns, the campaign will have proved itself worth while. And there is an odd angle about this matter; a good many men who have thought over their businesses for the purpose of finding advertising talking points have by that very thinking gotten more familiar with their own trade, and have worked out changes that have meant profit and increased service.

Lumberman's Sons Serving the Empire

The accompanying portraits show two of the sons of Chas. McGibbon, Penetanguishene, Ont., well known as the head of the McGibbon Lumber Company. The elder of the two sons, Lieut. Finlay

Lieut. Finlay T. McGibbon, 224th Forestry Battalion.

Lieut. John A. McGibbon, 2nd Canadian Division.

T. McGibbon, is with the 224th Forestry Battalion. He was educated in a commercial school at Toronto and subsequently was engaged in the company's office in Penetanguishene until 1911, when he went to Vancouver, B.C., and formed the McGibbon-Hodgson Lumber Company, which was engaged in the retail lumber and builders' supplies business. In June, 1916, he enlisted at Vancouver with the Pioneers, on his arrival in England was transferred to the 224th Forestry Battalion. Lieut. McGibbon has been in charge of operations at Bagshot, Surrey, England. The timber at Bagshot has now been cut out and Lieut. McGibbon has been sent over with his men to carry on lumbering operations in France.

Lieut. John A. McGibbon was born at Penetanguishene in 1889. He went in for the study of law and passed his final examination in May, 1916. Then he enlisted and soon was ordered to proceed overseas. After a period of training at Shorncliffe, he was sent to France in November, 1916. Subsequently Lieut. John A. McGibbon was sent to a military school and finally was transferred to the second Canadian Division, with which he is now serving.

Slash Disposal an Important Problem

The Spanish River Pulp and Paper Mills, Ltd., in a letter to the Canada Lumberman under recent date, express their appreciation of the opinions given by Mr. R. O. Sweezey in an article published in the September 15 issue of the Canada Lumberman on the subject of "Slash Disposal."

"The subject is of considerable importance," they say, "and we think that Mr. Sweezey has treated it very well. We thoroughly agree with most of his remarks, which seem to us to be framed with the idea of bringing the practical lumberman's experience gradually into line with the more theoretical views of those educated at a forestry school.

"Above all, we appreciate Mr. Sweezey's references to the necessity for approaching the matter under discussion with great care, in order that the lumber industry may not be crushed with the burden of expensive fire protection.

"The opinions of men of such undoubted experience as that of Mr. Sweezey should be listened to with respect by all who are initially concerned about it, or who regard the question of forest protection in a rather more academic light than the average lumberman does."

Rate Advance Case Again up in U. S.

The 15 per cent. rate advance case is on again in full blast in the United States. Hearings have been begun before the Interstate Commerce Commission in the reopened case. Leading railroad presidents have been giving evidence; representatives of some of the most important shipping interests in the country were also on hand to controvert the railroadmen's propositions and to make a fight against a general 15 per cent. rate increase.

While the first hearing was in behalf of the Eastern railroads, who are the prime movers in this case, there is a general belief that Western and Southern roads will get in line for a similar advance in their rates.

Lieut. Col. A. T. Thomson, D.S.O. and M.C., Port Credit, Ont., has been killed in action. Lieut. Col. Thomson was a well-known dealer in lumber and flour and feed at Port Credit, Ont.

R. S. Kellogg Addresses B. C. Shingle Men

At a recent meeting of the shingle manufacturers of British Columbia, held at Vancouver, B.C., Mr. R. S. Kellogg, of Chicago, secretary of the National Lumber Manufacturers' Association, J. S. Williams, of Seattle, secretary of the shingle branch of the West Coast Lumbermen's Association, and C. P. Constantine, of the Constantine Advertising Company, Seattle, were present to confer on matters of interest to the British Columbia industry.

Mr. Kellogg, in an address to the members present, referred to the great trade extension propaganda now being carried on by the National Lumber Manufacturers' Association. This organization is composed of many asociations, all of which are interested in various lines fo forest products. It has no individual members except as they were affiliated with the various associations composing its membership. The organization does not take up the cudgels in favor of any particular class of wood, but covers the whole field of the general use of wood in the thousand and one forms for which it is so well suited. Under the direction of its Chicago office, a large number of publications, written by thoroughly competent engineers and in very practical form have been issued dealing with the subject of wood construction in various phases in a fair and impartial manner. The high standard of these publications would be understood when it is stated that they were now extensively used as text books in various colleges and universities throughout the continent.

Mr. Kellogg spoke also at considerable length of the anti-shingle legislation which has advanced to a great extent in the United States, his remarks showing the comprehensive manner in which his association has taken up the subject. Through its organization, data had been secured covering 70,000 fires in various parts of the United States, and their cause. This information proved conclusively that only a small percentage of these fires could have possibly been charged to the use of wooden shingles. In the course of the investigation it was ascertained that in 60 per cent. of the cases the fires were really the result of carelessness.

The National Associaition is now working in conjunction with the National Paint Association, and hope before long to have a formula which can be given out to all paint manufacturers by the paint association, for a small royalty. This would do much to counteract the efforts of the substitute roofing men, whose product is really not as fireproof as untreated red cedar shingles.

Secretary Williams talked along the same lines and emphasized his points by statistics showing the inroads being made on the shingle industry by the agitation against the use of wood in building.

Comparative Figures of Shingle Costs and Prices

An interesting statement showing the comparative costs of the manufacture of shingles during corresponding periods in 1916 and 1917 has been prepared by Secretary F. L. Nash of the Shingle Agency of British Columbia. The statement is as follows:

Current prices of various items that enter into the cost of production of red cedar shingles and comparative prices of same in 1916, together with the percentage of increase. (Prices are f.o.b. Vancouver, B.C.)

	1916.	1917.	P.C. Increase over 1916.
Shingle logs—Average price per M.	$12.00	$14.50	21
Shingle bolts—Price per cord	6.00	8.50	42
Shingle bands (Acme galv. bands)—Per lb.	.08½	.17	100
Band nails, per cwt.	6.65	8.50	20
Shingle saws (42-in. shingle saw taken as av.)	39.000	71.50	83
Belting (8-in., 5-ply rubber taken as av.) per ft.	.85	1.19	40
Lubricating oil (heavy red engine oil taken as an av., containers included)—Per gal.	.27½	.34½	26
Labor—Sawing, per M.	.14	.20	43
Packing, per M.	.08½	.12½	47

Other labor advanced in proportion.

Comparative prices received for red cedar shingles, with percentage of increase, prices f.o.b. mill to the trade, are as follows:

	1916.	1917.	P.C. Increase over 1916.
Perfections	$2.90	$4.20	45
Eurekas	2.70	3.30	22
XXXXX	2.45	3.30	34
XXX	2.15	2.80	30

Airplane Spruce will Help to Win the War

The survey of the forest resources of British Columbia, upon which the Canadian Commission of Conservation has been engaged for the past four years, has proved of striking immediate value in the prosecution of the war. The Imperial Munitions Board, which has definitely taken in hand the organization of airplane manufacture, found itself in immediate need of large quantities of airplane spruce, and the Commission was able, as a result of its survey, to furnish the Board with specific information as to the location and ownership of all the large bodies of spruce in British Columbia suitable for that purpose. The fact that this information had previously been collected enabled the Munitions Board to take up without delay the matter of securing the necessary supplies of this vitally important material. Steps are being taken to increase the production of airplane spruce beyond all limits previously thought possible. This is an example of the vital importance of Canada's natural resources in winning the war. Many experts hold that the best prospect for definitely and overwhelmingly maintaining the supremacy of the allies is in connection with the war in the air. This involves the manufacture of many thousands of airplanes, toward which the most intense efforts of the allies are being directed. The most suitable species of wood for this purpose is Sitka or silver spruce, of which great quantities are to be found on the Pacific Coast of North America. Canada's share of this timber is very large, and is considered so important in the prosecution of the war that its export, except under license, has recently been prohibited by the government to all destinations abroad other than the United Kingdom, British possessions and protectorates.

Confer on Knock-Down Houses

The United States Government will soon contract for 300,000,000 feet of Southern pine for the building of knock-down houses for the use of troops in France. A general conference of lumbermen was held at New Orleans, La., recently, at the invitation of the Southern Pine Emergency Bureau for the purpose of discussing this project. Plans prepared by the War Department architects were submitted. The plans provide for houses built in panels that can be shipped knocked down and can be bolted together by the soldiers. The manufacturers present thought this could be done best by co-operation between manufacturers and contractors. The manufacturers did not feel that they could do the construction work to good advantage. They also suggested certain changes in the specifications that would allow the use of stock of standard sizes. Labor is unobtainable in Europe, and this is the reason the War Department favors the knock-down house. A committee was appointed to work out the technical difficulties. This committee consists of C. D. Johnson, St. Louis, chairman; C. A. Buchner, Millville, La., and H. L. Demuth, of Bogalusa, La.

U.S. Taxing Log Freight Bills

A three per cent. tax will be collected by the United States Commissioner of Internal Revenues on all shipments of logs on every logging railroad in the United States, regardless of whether or not these railroads have ever filed tariffs on such shipments, and regardless of whether or not they are public carriers or merely plant utilities. This information has been received from the Commissioner of Internal Revenue at Washington, D.C. The law provides that in case tariffs for those railroads are not on file, the Commissioner of Internal Revenue shall base his tax collections on rates filed by other roads which furnish similar service.

The Commissioner also advises that the three per cent. tax on bills of lading for forest products will be collected at destination on all shipments sent collect.

What Becomes of the Shell Boxes?

It is often asked what becomes of the hundreds of thousands of wooden boxes sent from this country and from Great Britain to the front. Many of the boxes are made of the highest grades of lumber, and it is not infrequently suggested that they are burned or turned to some useful account in the trenches. A light is thrown on the subject in a report of the Select Committee of National Expenditure, just issued in Great Britain. It is stated that there is in France and at a British port an immense accumulation of used brass shell cases and wooden shell boxes to the value of several millions of pounds. Adequate arrangements have not been made for the return and re-use of these boxes, and meantime the manufacture of new brass cases and wooden boxes proceeds.

Special Facilities for Cables Overseas

Special facilities are announced officially for week-end cable letters at cheap rates to or from Canadian soldiers, sailors, and nurses on overseas service. The letters must be of a social character, and can be cabled at 5 cents a word to or from Ontario.

Pulpwood Supplies in Quebec

In a recent report to the Royal Dominions Commission, Mr. Elwood Wilson, forester of the Laurentide Paper Company, deals with important features regarding pulpwood supplies in Quebec.

The total timber area of Quebec north of the St. Lawrence, the principal pulpwood area, is given as 303,855 square miles. Of this, however, only 147,247 square miles, or less than 50 per cent., is accessible by water and rail; the balance "will not be accessible until railroads are built in the far North."

The whole area can be divided into six watersheds, as follows:

	Square miles.
James Bay watershed	73,745
Ottawa watershed	37,166
St. Lawrence watershed	104,806
St. Maurice watershed	15,925
Saguenay watershed	35,157
Height of Land, east of Lake St. John watershed, to boundary	37,056

Mr. Wilson also distributes the area to the various forest types. It appears that of the 147,247 square miles of available mileage only 69,118, or 48 per cent., are really timbered.

The better class, Middle St. Lawrence type, being represented by 42,780 square miles, or nearly two-thirds, its large cordage of possibly 10, and probably 8, cords per acre, brings the average to 8.2 to 6.2, although in the other types the product runs mostly only between 5 and 3 cords.

In the St. Maurice Valley the average on timbered area is stated as 6.75 cords, the best 8.6 cords, and the average over all 3.3 cords, with a percentage of balsam which runs from 48 to 78 per cent. in different localities.

The valley of the St. Maurice River contains about 12,329 square miles, and has all of the timber types of the province except the "Northern Subarctic." The area may be divided as follows:

	Square miles.
Water	758
Merchantable timber	5,091
Lumbered	1,603
Swamp, not timbered	52
Burnt, reproducing spruce and balsam	2,873
Burnt, reproducing jack pine	656
Burnt, not reproducing	652
Settled	644
	12,329

Practically all of the timber is accessible, but there are some areas which cannot be lumbered profitably at present. Mr. Wilson estimates the total stand of timber at 10 cords per acre over the "merchantable" area, giving 32,582,400 cords, and on the cut-over areas at 5 cords per acre, 5,129,600 cords, or a total of 37,712,000 cords. This is made up as follows:

	Cords.
Balsam	24,211,040
Black spruce	7,617,824
White spruce	5,883,072

The spruce timber is generally sound, but about 10 per cent. must be deducted for rotten balsam, which would reduce the cordage to 35,290,832 cords.

The cut in 1915 in this section was above 400,000 cords, an increase in the last five years of 28 per cent. per annum. If only a 10 per cent. increase of cut is anticipated for the future, the standing timber will be exhausted in fifty years, not counting loss by fire. "There is not sufficient timber left under the diameter limit set by the government to produce within thirty years more than three to five cords per acre, and the figure is nearer three cords than five. The growth on the area lumbered each year from now on will not be sufficient to take care of the increased cut."

Not much hope is held out for a reproduction of the soft woods, except balsam, under present methods. Several tracts are cited which were burned fifty years ago on which there is to this day no reproduction of spruce or balsam, except a few scattered trees.

The Three Rivers Shipyards, Ltd., has been incorporated at Ottawa, with a capital of $49,000, to build ships of all kinds at Three Rivers, P.Q. The incorporators are T. M. Kirkwood, of Toronto and Chouinard, and L. Hayman, of Montreal.

How a Canadian Forester Feels in Egypt

"Well, I wish the war would hurry up and finish. I'm tired of the sun and glare and homesick for the dark green depths of a trail right up in the jack pine, and a bit of a lake with trout in it."

Personal and Miscellaneous

Mr. A. E. Gordon, of the firm of Terry and Gordon, wholesale lumber dealers, Toronto, is on a business trip to British Columbia. He expects to be absent about six weeks.

Mr. F. N. McCrea, of Sherbrooke, the well-known lumberman, has accepted an invitation to become again the candidate for Sherbrooke County, P.Q. He is a supporter of Sir Wilfrid Laurier.

Messrs. Walter and Charles McNeil are erecting wooden vessels along the East River, in New Glasgow, N.S. The vessels will be of different sizes, one a fairly large one and the other of a smaller capacity.

Mr. Charles Power, son of Mr. W. M. Power, Quebec, has been chosen Liberal candidate for the new division of Quebec South. He has served at the front, obtained the Military Cross, and was invalided home. Mr. Power is an anti-conscriptionist.

Col. J. B. White, in addressing a meeting of the Montreal Soldiers' Wives League, recently, described the work done by the Canadian Forestry Battalion in France. He especially thanked the League for the presents of socks, as one of the great problems of the men in France was to keep warm.

Two lumbermen will contest the united counties of Richmond and Wolfe, P.Q. Mr. E. W. Tobin, of Bromptonville, the present Liberal member, will oppose Mr. M. George Crombie, of Richmond, the senior partner of the firm of Williamson and Crombie, lumber manufacturers, Kingsbury, P.Q., who has been selected as Unionist candidate.

Mr. J. A. Bothwell, manager of the Brompton Pulp and Paper Company, East Angus, P.Q., has declined an invitation to contest Compton County as the Win-the-war candidate. Mr. Bothwell took the ground that, as the head of a company employing many men producing for the country's needs, his best work can be done in his present position.

Concrete shipbuilding has begun in Montreal, under auspices which are likely to bring it to a successful issue, if the scheme proves at all practicable. The work of construction is being carried out by the Atlas Construction Company, which has had a great deal of experience in the handling of cement and reinforced steel, from which the hulls of the boats will be made. One boat is now under construction at the Montreal Dry Dock Company's plant. She is about 200 feet long, the hull having a thickness of 3 to 5 inches.

Mr. Robson Black, Secretary of the Canadian Forestry Association, Ottawa, has recently completed an itinerary of seven New Brunswick towns and cities, during which he addressed well-attended public meetings on forest conservation, presenting the facts of the present timber supply and the need of eliminating fire by a reorganized forest service, and the official supervision of cutting operations so as to prevent waste. The meetings were held under the auspices of Boards of Trade and similar organizations, and the addresses were illustrated by motion pictures.

The Chester Basin Shipbuilders, Ltd., Chester Basin, N.S., built and launched a schooner during the summer that has just passed. At the time of the launching, early in the fall, they had the keel laid for another schooner of the same size, namely, 100 tons, and expected to have it ready for launching about the end of the year. In October they commenced building a 600-ton four-masted schooner, which they expect to complete in June, 1918. The company's yard is equipped with a rotary saw, band-saws, and planers. They give employment to 40 men.

The Falmouth Shipbuilding and Transportation Company, Ltd., incorporated recently under the Nova Scotia Companies Act, is reported to have acquired a site at Falmouth, N.S., for a shipbuilding plant. The location is at the junction of the river and passenger bridge, adjacent to the Dominion Atlantic Railway and the Hants Manufacturing Company's sawmill, where sufficient lumber has been accumulated for the construction of the first vessel, which will be commenced shortly and launched early in the autumn. The officers are: E. E. Armstrong, president; F. W. Dimock, J. L. Sexton, T. B. Aikins, and T. A. Mosher, directors; A. P. Clark, secretary-treasurer.

The Established Channel of Business Information

Recently Governor Whitman of New York State broke several engagements and travelled all the way to Chicago to address the Associated Business Papers of the United States and Canada. He said he did so because he regarded the business press as the established channel of business information, and, as New York State is the largest business and financial centre of the world, he desired to place the views of big business of New York before the business interests of the entire United States.

The business press of Canada has been quietly performing great work for Canadian manufacturers, business men, and financiers, since the war broke out.

Car Builders Discuss Wood and Steel

The relative merits of wood and steel for car building purposes were discussed recently at a meeting of the Car Foremen's Association, Chicago. A report of the meeting published by the American Lumberman shows that the old idea that steel would soon take the place of wood in car building has been revised as a result of lessons taught by experience.

Mr. H. G. Sackett, timber engineer of the Chicago, Milwaukee & St. Paul Railway Company, who had access to the car service records of his line, drew liberally upon them, and also upon certain statistics of the railroad lines of the country as a whole. His paper is available in a bulletin of the National Lumber Manufacturers' Association, and it is not necessary, therefore, to review it in detail here. It may be said, however, that the record of maintenance of passenger coaches for an entire year showed that wood cars ran on an average 39.8 months before shopping, and steel cars 37.3 months, and that the shopping cost was 37 per cent. greater for steel than for wood. This cost on sleeping cars was 34 per cent. greater. In these figures, also, the wood equipment was considerably older than the steel, necessarily requiring a correspondingly larger outlay for repairs. Another table showed the cost of repairs to twenty-five wooden passenger coaches for the first five years of service to total $25,121.17, and $41.855.51 for twenty-five steel coaches, or 67 per cent. greater for steel. This paper also stated that it usually takes longer to make repairs on a steel car. "A wooden car can be very badly damaged and yet it will be in the shop a shorter time than a large steel car whose center sill and main body have only been pushed slightly out of alignment," said Mr. Sackett.

As to length of life, it is generally considered that wooden cars with ordinary repairs will last from twenty to thirty years. Steel cars have not been in service more than ten years and their actual length of life has, therefore, not been positively determined, but from the condition of the older steel cars at the present time it is obvious that they will not last as long as the average wooden cars. The author gave a number of instances of the most usual forms of depreciation, resulting largely from corrosion.

The conclusion to which the author arrived was that wooden cars can be built more cheaply, that they can be maintained at a lower average maintenance cost and that they will have a longer average life.

Turning to freight cars, the paper gives figures which show in general that four-fifths of the all steel cars built up to the present time have been of the hopper and gondola types. There are still in service more all wood freight cars than steel and the steel underframed combined. The steel underframe and wooden superstructure is recommended as the most durable type of construction because of the difficulty of fastening draft rigging to a wooden underframe in such a way that it will not loosen in time and cause failure. Figures of one of the western roads were referred to, showing that but 60 per cent. of the composite gondolas in service required repairs while 72 per cent. of the steel gondolas were brought to the shop. The difficulty of blocking or securing freight in the all-steel box car was also referred to.

There was a very lively discussion of the paper at the meeting. The first speaker stated that some thirty years ago he was asked to prepare a paper to read at such a meeting and intended to talk on the coming of the steel car. Upon reconsidering, however, he changed the subject of his paper to something more conservative, deciding that the steel car had not yet really come. He doubted whether it could be said that it had really arrived at the present time.

The next speaker stated his belief that car designers were coming more and more to recognize the valuable features and limitations of all materials, concentrating more and more on the strong steel underframe with a wooden substructure. It is necessary that a car shall be able to withstand the shocks to which it is subjected in rough handling of long trains and also the hump switching which is now largely used. The railroads are beginning to realize that steel is not a good material to use in the presence of sulphuric acid which is developed when coal is subjected to moisture and here conditions seem to favor a steel frame with wooden superstructure. Especially in drop bottom cars is a steel frame absolutely required because the frame of such a car is a mere skeleton and can not be made sufficiently strong of wood. In box cars the speaker questioned whether steel superstructure would be much used in the future. He favored, however, building up a light skeleton structure of steel, with either a single or double sheathing of wood. This, in his opinion, was preferable to using a wooden frame, which does not stand up well because of the difficulty in making rigid fastenings. Under the swaying stresses the bolts tend to loosen up. The speaker further said that one of the railroads, which perhaps was the pioneer in the use of steel box cars, a few years ago found that it had not made sufficient allowance for the stresses incident to side sways, and in some instances the cars deviated from line 18 inches to 2 feet. These cars were simply run by the side of a concrete wall which had been built for that purpose and pushed back into position again with screw jacks.

In concluding the speaker predicted that the freight car of the future would combine the strength of steel where strength is needed, with the good qualities of wood where wood obviously is the better material to use.

The next speaker, Mr. Wallace, urged the desirability of conservatism in dealing with such questions. A few years ago there was a general condemnation of the new type of locomotive, which was declared to be absolutely ridiculous, but for some reason or other these locomotives continue to be built and increasing numbers are now in service. Wood might answer very nicely for a 40 or 50-ton coal car, but imagine it being used as a material for a 100-ton coal car. The car in any case should be constructed for the conditions on the road where it is going to have its greatest mileage.

The speaker further remarked that there were steel cars and steel cars, and he very much questioned whether car designers made proper allowance for depreciation in strength of materials due to corrosion. He was under the impression that they figured the thickness of metal plates and the size of beam upon what would get by while the car was new, entirely disregarding the effect of ten years of service with perhaps indifferent paint protection.

Britian Securing Steam Trawlers in Canada

The Dominion Government has undetraken to have built in Canada 36 steel steam trawlers and 100 wooden steam drifters, of standard British types. These trawlers will be about 125 feet long between perpendiculars, 23 feet beam, and 13½ feet deep. They will have triple expansion engines of about 500 horse-power. The work of having these vessels built has been delegated to J. W. Norcross, vice-president and managing director Canada Steamship Lines, Ltd., Montreal, who is acting as director of construction, and is being assisted by three of the company's other officials, W. E. Burke, assistant manager; F. S. Isard, comptroller, and H. W. Cowan, operating manager. The orders are being distributed among existing shipbuilding plants from Quebec to Port Arthur, and it is probable that one or more plants which have not been in operation for some time will also be utilized. The materials, including engines and other machinery, are bought by the government and supplied to the builders.

Toward the end of the summer of 1916 a demand sprang up in Canada for freight vessels for Norway. Between September 19 and November 15, 1916, the Dominion Government authorized the exportation to that country on completion of 18 steel steamships, to be built at New Glasgow, N.S., Montreal, Toronto, Port Arthur, and Vancouver. In addition to these a Toronto plant was authorized to export two steel freighters to the United States on completion. It appears probable that the majority, if not all, of these 20 vessels, for the export of which licenses were granted, will be taken over by the British Government, and it may be regarded as a certainty that, for some time to come at least, no more licenses for export will be issued. In addition to the above mentioned vessels, a company is building three more of the Norwegian type, making six in that plant.

A Busy Nova Scotia Shipbuilding Firm

A comparatively new shipbuilding firm at Shelburne, N.S., is that of the Shelburne Shipbuilders, Ltd., formed in December, 1916. The manager, foreman, and staff, however, are all experienced shipbuilders. The president is Mr. A. D. Bruce, who was with the Joseph McGill Shipyard at Shelburne for twenty-seven years. The company have one of the best-equipped plants for shipbuilding in Nova Scotia. All the machinery is new, and includes bevel band-saws, rotary band-saws, planers, buzz planers, matcher and moulders, drilling machine, turning lathe, treenail and plug machines—in fact, every machine necessary for the vigorous prosecution of the shipbuilding industry. Electric power is used. The company have their own forge and galvanizing plant and a commodious wharf and docks, together with ample shed room for working in bad weather. Steady employment is given to about 45 men. The Shelburne Shipbuilders, Ltd., recently completed a freight and passenger steamer 140 feet long, 26 feet wide, and 12 feet deep for Messrs. Hugh Cann & Son, Ltd., Yarmouth, N.S., which will be operated on the route between Yarmouth and St. John, N.B. They have now started upon the construction of a tern sailing schooner of 325 tons.

Broadway Will Be Paved With Yellow Pine Blocks

A considerable portion of Broadway, from Chamber Street to Fourteenth Street in New York, is to be paved with creosoted yellow pine blocks. This being the busiest thoroughfare in America, the use of wood block paving on it is most important. Many thousands of yards of creosoted pine block paving is involved in the order. Another part of Broadway is to be paved with asphaltum over granite blocks, and there will be a fine opportunity to compare the two pavements.

Shipbuilding Activities East and West

The Tusket Shipbuilding Company is reported to have completed its organization and to have acquired several old shipyards at Tusket, N.S., and to be negotiating for other yards. It is stated to have four vessels under contsruction at Shelburne and four at Liverpool, N.S.

Alfred Wallace, of the Wallace Shipyards, Ltd., North Vancouver, B.C, is reported to have announced on returning there recently from Ottawa that the company had contracts for two steel steamships for British interests and for eight wooden ones for the Imperial Munition Board.

It is reported that a shipbuilding plant is being built at Catalina, Nfld., at a cost of about $2,000,000, and that wooden shipbuilding is extremely busy throughout the colony. A number of vessels are being built there under a bounty of $20 a ton, as provided in the government's act of last year.

The Whalen Pulp and Paper Company, which is engaged in establishing the largest industrial plant on Vancouver Island at the new town of Port Alice, near the head of the southeast arm of Quatsino Sound, will lay down two keels at a time, and will keep on building ships until it has enough of them to handle its export trade.

Thomas C. Rice, of Weymouth, N.S., is again going into shipbuilding, and is preparing to lay the keel of a large steamer. The vessels Mr. Rice built in years gone by and of which he was the sole owner, would make a good fleet if they were assembled, and would include square riggers, tern schooners and two-masted schooners.

A recent despatch from Washington quotes Chairman E. N. Hurley, of the United States Shipping Board, as stating that by March 1st, 1918, the shipyards of the United States will have completed 1,000,000 tons of ships. The new goal of the Board's expectations, he said, was ten times the production of 1916, which was a little over 750,000 tons.

The St. John Shipbuilding Company, St. John, N.B., are constructing five ways at Courtenay Bay, St. John, N.B., where five five-masted schooners with auxiliary power are to be built. It is reported that ten ways in all are to be laid down, that vessels will probably be built there for the Imperial Munitions Board, and that eventually steel vessels will be built.

The large shipbuilding plant on the Niagara River three miles below Bridgeburg, which has been closed for several years, will be opened at once for the construction of all-steel ships of Welland Canal size. The Canadian Allis-Chalmers Company, the holding concern of the Canada Foundry Company, which has owned the plant for ten years, will go into the shipbuilding business.

An ocean-going cargo steamer with deadweight capacity of 3.500 tons, named the "Tento," was launched on October 22, at the Polson Iron Works yards, Toronto. The "Tento" and a number of other vessels which are to be constructed were ordered by the Norwegian owners, but have been taken over by the British Government. The "Tento" is a steel vessel 261 ft. long, 43 ft. 6 in. wide, 23 ft. deep, with a draft of 19 ft. 6 in.

The wooden steamer Windsor was successfully launched at Robert Morrill's shipyard at Collingwood recently. The ship has been built for the Ontario Gravel and Freighting Company, Windsor, Ont., and has the following dimensions: Length, 105 ft.; breadth, 23 ft.; depth 12 ft., while the motive power is fore and aft compound engines, supplied with steam from a Scotch boiler 12 ft. by 13 ft., and carrying a working pressure of 155 pounds per square inch.

The shipyard of the Three Rivers Shipyard Company, Ltd., which is building two wooden steamers for the Imperial Munitions Board, at Three Rivers, P.Q., is situated at the western side of the Three Rivers harbor, and covers an area of some five acres. Dredging is to be undertaken in order to reach the deep water in a basin of 350 feet long, 150 feet wide, with a mean depth of cut of 7 feet. The plant will consist of one two-storey machine and pattern shop, 75 feet by 175 feet, concrete foundations, the bottom being clay and sand. Mr. John Bourgeois, Quebec land surveyor and A. M. Can Soc. C. E., is the acting engineer for the company.

Specifications issued by the United States Emergency Fleet Corporation for the spars and masts for the wooden vessels which are to be built on the Atlantic, Gulf, and Pacific Coasts for the United States call for the use of Douglas fir spars and masts. Each vessel will be equipped with a foremast, a mainmast, and eight cargo booms. The foremast will be 72 feet 6 inches long, 8 inches in diameter at the top, 18 inches in diameter at the heel, and a maximum diameter of 13 inches. The mainmast will be 86 feet long. The booms will be 42 feet long, 9 inches in diameter at the top, 12 inches mid-diameter, and 10 inches in diameter at the base. It is expected that 600 of the larger size and 2,400 booms will be required.

The first wooden ship of its kind built at Quebec since the old days of the sailing vessels, when the shipbuilding industry flourished in Quebec, was launched October 28, at St. Laurent, Isle of Orleans. The vessel is a four-masted one, with auxiliary power, and its length over all is 223 ft., 42 ft. beam, and the depth of hold is 20 ft. Its tonnage is figured about 1,350, while deadweight will be about 2,100 tons. The schooner was constructed by the Quebec Shipbuilding and Repair Company, and it was named the "Martin Connolly," after the local representative of the company, the head office of which is located in Montreal. The boat is for private enterprise, and is not one of the vessels constructed for the Imperial Munitions Board. The material used was wood grown in Eastern Canada, except that used for masts and decking.

Inland Empire Shipments Show Increase

During the first nine months of the present year, mills in the Inland Empire of the United States, reporting to their Association, shipped 4,700 cars more of lumber than during the corresponding period of 1916. The total increase of shipments amounted to 155,265,000 feet. Shipments exceeded cut during the first nine months of the present year by almost 50,000,000 feet. It is interesting to note that the shipments of white pine to Canada from this district were more than doubled. During the first nine months of 1917, 382 cars were shipped into Canada, containing 9,212,859 feet. During the first nine months of 1916, the shipments amounted to 191 cars, containing 4,579,387 feet.

Lieut. Colin G. P. Campbell Killed in Action

Word from the British front has been received by G. D. Campbell, president of the Campbell Lumber Company, with lumber and pulp mills at Weymouth, Nova Scotia, that his son, Lieut. Colin G. P. Campbell, M.C., 5th Reserve Brigade, R.F.A., was killed in action Oct. 10 When he met his death he was on his last tour with the guns up the line, before being transferred to the aviation corps. Lieut. Campbell was one of the first Canadians to volunteer for overseas service, and had been wounded twice in previous engagements, first at La Basse, in June, 1915, and again at Death Valley, beyond Crucifix Hill, near Courcelette, on July 18, 1916, when he suffered "multiple wounds" and was awarded the Military Cross for conspicuous bravery. This is the second of Mr. Campbell's six sons in the service who has been killed in action. Lieut. Kenneth A. Campbell, of the 42nd Black Watch, Royal Canadian Highlanders, met his death at Vimy Ridge, on January 23, 1917.

Piece Work in Lumber Yards

A successful hardwood dealer in an Ohio Valley city is a great believer in the piece-work system as applied to handling lumber. He has been using it for a number of years, and has found that it works. It seems to be of special interest at this time, when labor is scarce and the character of help which can be secured for lumber-yard operations is not any too good.

The first thing, of course, is to establish a rate that will insure having the lumber handled at a reasonable cost to the yard, and at the same time will enable the industrious worker to make a good return on his efforts. The yard should be protected and the unambitious employee penalized.

After the rate has been decided on it should not be changed. Sometimes employers who adopt the piece-work plan find that certain individuals are making such large amounts that their earnings seem unreasonable, and an attempt is made to revise the rate downward. But this involves an implication of bad faith that is likely to cause the workers to lose their enthusiasm.

One of the advantages of the piece-work system, as indicated by the experience of the dealers referred to is that yard crews do not have to be driven, either individually or collectively. The man who hangs back and does not do his part to get the car loaded or the pile stacked is not only decreasing his own earnings, but those of the other men in his crew, and they are sure to play the part of foreman and to prod him to greater exertions. Hence "soldiering" is reduced to a minimum.

The men likewise do not need to be watched to see that full time is put in. On the other hand, some of them come to work an hour or two ahead of the usual time, in order to get through early. They are in every way more interested than under the day-work system, because their earnings are directly in proportion to the amount of work actually accomplished.

It is very little more trouble to keep track of footage handled under the piece-work system than to total up the time put in, and the inspector can take care of this detail as well as not. Some of the hardwood men believe in paying a little higher rate for handling thick lumber, on account of the usual amount of labor required, and there are other individual variations; but the plan as a whole seems to be readily workable.

How to Pile Lumber for Best Results

Details of Methods Recommended by Railway Storekeepers' Association—The Use of Strips and Sheds—Protection Problems

At a recent meeting of the Railway Storekeepers' Association of the United States, a committee on the arrangement of storage yards for railway lumber submitted a report containing a great deal of useful information on the piling of lumber. That portion of the report which is of general application, follows:—

In selecting a site for the storage of lumber, care should be used to avoid locating upon low ground which is overflowed at intervals or upon which water collects and stands after rains or snows. If, on account of local conditions, such a site is the only one available, proper drainage must be provided to carry off quickly any accumulating moisture. No material should be piled on bearings spanning low spots or drainage ditches in which there is standing or running water.

The site of the storage yard should be fairly level, on grade with the tracks which serve it, and should, in all cases, be covered with cinders or similar porous filling to a depth of at least 6 inches to insure proper drainage and keep down weeds.

Layout of Yard

When tracks have been installed the yard should be carefully measured and platted and proper space assigned to each kind, class and size of material carried. Various classes and kinds of stock should be grouped and so located as to permit of handling with greatest facility to and from cars and to points of consumption. All pine and fir bridge timber should be in the same section of the yard, served by the same tracks and piles arranged in sequence according to sizes. All oak timber for maintenance of way use should be similarly arranged. Switch ties should be grouped, with each length piled separately and arranged according to size. All plank 2 inches thick and under, as well as boards of all kinds and dressed car material, such as siding, lining, roofing and flooring, which are received in straight quantities, carloads or less, should be assigned to one section of the yard where it can be handled direct from cars to pile and it is advisable to have this material located in the same section of the yard as the lumber storage shed and served by the same tracks, if possible.

In platting the yard it is advisable to arrange for all sizes 2 inches thick and over to lie parallel with the tracks so that it may be most economically handled. If space will permit it is also advisable so to pile all plank and boards.

In all cases piles must be so platted as to allow for two lots of each size and kind of material, so that new receipts of stock will not be piled on material which has been in stock for long periods. This will permit the using of the old stock first.

When the yard has been properly platted and the location of each size and kind of material determined, the pile locations and alleys should be staked out by actual measurement, using care to line the piles parallel with the track.

Bearings

Substantial bearings should be constructed of second-hand or reclaimed material, such as side plank, old car sills, second-hand bridge and structural plank and timbers, etc., but in no case should material be used which shows evidence of decay.

Separate bearings should be constructed for each pile of material, and in the construction of these bearings consideration must be given to the nature of the ground upon which they are laid—i.e., whether it is solid, thoroughly settled or recently filled ground; and, if the last, the depth of the fill. Bearings should be built of sufficient strength to carry the maximum load the space will accommodate, this regardless of the quantity of stock to be cared for in the immediate future.

All material used in bearings should, after being cut to the desired size, be protected from decay by applying two coats of hot creosote oil. The creosote oil should be heated to a temperature of about 190 degrees (not over this) by placing it in a metal vessel about the size of an oil barrel, which should be filled not more than half full. This should be placed over a small, slow fire until properly heated, but great care should be used to prevent the oil from getting too hot or the fire too large, as the oil is highly inflammable. The operation should be conducted at a sufficient distance from buildings and lumber piles to insure safety.

When the creosote has been properly heated, small bearing pieces and blocking may be coated sufficiently by dipping in the heating vessel by means of timber tongs or tie tongs. To the larger pieces the creosote should be applied thoroughly with a brush. This can be simplified by pouring the hot creosote from a spout can upon the surface of the timber and spreading it with a brush, but care must be used to have all sides and ends thoroughly coated.

Each bearing piece must be held upon a sufficient foundation to prevent, as much as is possible, the settling of the bearing after the material has been piled thereon, and sufficient bearing pieces must be laid under each pile properly to distribute the load and prevent sagging of the material between bearings. The thinner the material to be piled, the greater the number of bearings necessary. Material under 2 inches in thickness should have a bearing at least every 5 feet of its length. If 16 feet in length, four bearings should be used; if 8 to 14 feet in length, three bearings should be used. Material 2 inches to 6 inches in depth should have bearings not more than 8 feet apart, while material over 6 inches in depth may safely have bearings spaced 12 feet apart, and in the case of timber 10 inches or over in depth the bearings may be spaced 16 feet apart. In all cases the outside bearings should be directly under the ends of the material and the intermediate bearing equally spaced.

The bearing should consist of three parts—viz., ground pieces, "A"; risers, "B," and bearing pieces, "C."

The ground pieces, A, are used to give greater width of surface to the foundation. These ground pieces should consist of 2 or 3-inch plank from 6 to 12 inches in width and 2 feet in length and should be laid in relation to the position of bearing piece C. The risers, B, are used to give the proper elevation to the bearing. These pieces should be set at least 6 inches in width and of such height as is necessary to give the proper elevation and should be from 18 to 24 inches long. They may be formed of several pieces of 2 or 3-inch plank 6 inches or over in width laid one upon the other until the required height is reached. These risers should be set crossways at about midway the length of the ground pieces.

When the necessary number of foundations composed of ground pieces and risers have been prepared, the bearing piece C should be applied. The dimension of the bearing piece will vary according to the material available and the weight of the lumber for which the bearing is being constructed. It should not be less than 4 inches by 6 inches and should be long enough to rest upon at least three foundations. If rectangular in shape it should rest upon the edge. Where heavy loads are to be applied to bearings, the bearing piece should not be less than 6 inches by 8 inches. Two thiinner pieces, if of the same width, may be laid down upon edge side by side and spiked together to obtain the required strength. Bearing pieces should not be nailed to risers, as, in case of a slight settling of the bearings at some point after the load has been piled upon it, it may be found necessary to jack up the bearing piece at that point and correct the level by inserting shims between the bearing piece and the riser. The top line of the bearing piece should be perfectly level longitudinally.

Each pile bearing should be constructed in such a manner that the material piled thereon will be higher at one end than at the other and afford sufficient pitch or slope to permit any accumulation of moisture from rainfall or melting snow to run rapidly off the pile. The high end of the pile is termed the "front" of the pile, and for uniformity all piles in a yard should pitch or slope in one direction, if possible.

The elevation of the bearings will vary according to the character of the lumber to be piled upon them. Bearings for lumber up to 24 feet in length should have an elevation or pitch of not less than one-half inch for each foot in length of the material to be piled thereon. It is not considered necessary to have an elevation greater than 16 inches, regardless of the length of material. The elevation allowed should be the difference between the height of the front and rear bearing pieces, and any intermediate bearing pieces should be so adjusted in height that when the material is laid upon the completed bearing it will rest upon all of the bearing pieces without sagging at any point.

Method of Piling Lumber

In piling of all lumber care must be used to have the piles substantially constructed to prevent them from falling apart or being blown over by wind storms. The sides or edges of the piles should be straight and parallel both horizontally and vertically. Piles of boards and 2-inch plank should not be built wider than the length of the lumber in the pile and in no case should the width of the pile exceed 16 feet. Plank over 2 inches in thickness and all timber should be piled in narrow piles of from 6 to 10 feet, although several piles of the same kind of material may be placed upon the same bearings closely adjoining each other. This arrangement permits the complete removal of a pile without waiting to exhaust the entire stock of one size and provides space for piling receipts of new stock without piling it on older or seasoned lumber.

Boards and 2-inch plank should be piled as high as conditions will permit, up to 20 feet from the ground. Larger sizes may be piled as high as facilities permit and local conditions require.

Lumber Sheds

Wherever a supply of kiln dried lumber is carried such as car siding, car lining, car roofing, car flooring, building siding, ceiling and flooring and also dry poplar, ash, mahogany and quartered oak, a shed sufficient in size amply to protect this material should be built.

The lumber shed should be of standard design, and may be left open on four sides or enclosed on one or more sides, as local conditions and the character of material to be stored may require.

Bill of material (preferably hemlock or chestnut) for one bent of standard lumber shed, 32 feet deep and 15 lineal feet of roof, would be:

	Feet	Feet	
1 Rear post	6x 8x16	64	
1 Center post	6x 8x18	72	
1 Front post	6x 8x20	80	
			216
4 Rafters	2x10x16	107	
2 Tie braces	2x10x16	54	
1 Lookout plate	2x10x16	27	
			188
2 Lookout braces	2x 8x 8	22	
6 Rafter braces	2x 8x10	80	
2 Lookout rafters	2x 8x12	32	
13 Roof joists	2x 8x16	278	
			412
Roof sheeting	1x8x12—16	576	
Lookout sheeting	1x8x12	96	
656 sq. ft. prepared roofing at 1¼c		...	
			672
Total			1,488

In the piling in sheds of dressed boards and 2-inch plank which have been kiln dried it is permissible to strip only between each five layers. In the piling out of doors of similar material which has not been kiln dried, as well as all heavier lumber, strips must be used under each layer in all cases.

In piling 1-inch and 2-inch lumber, the stock being piled should be used for piling strips, but in larger sizes strips 1 inch thick and not less than 2 to 4 inches wide should be provided.

The piling strips should be no longer than the width of the pile, and in no case should project more than 2 or 3 inches beyond the side of the pile. No strips should be allowed to run through from one pile to another. One piling strip should be used over each bearing piece upon which the lumber rests and should be placed directly over the bearing piece or the strip previously applied. The edge of the strip used on the front of the pile should be allowed to project over the ends of the lumber upon which it rests at least ⅛ of an inch. This will act as a "drip cap" and assist in preventing the ends of the lumber from checking and splitting.

The ends of each course of lumber applied to the pile should be brought flush with the edge of the piling strip at the front of the pile. By following this method the pile will have a forward pitch of about 1½ inches per foot, which, together with the slope of the pile, will prevent accumulation of moisture from rains or snow.

Except where piled in a shed, all lumber should be separated in the layers so that a space of from ½ inch to 1 inch is left between pieces to allow for free circulation of air on all four sides of the piece. This permits of rapid and thorough drying of the lumber and prevents sap staining and rot. Lumber so piled may be allowed to remain in stock for a long period without damage. This space may easily be regulated by instructing the workmen to allow the width of a finger between the edges of pieces.

All boards and plank dressed on one side, which are stored out of doors, should be piled with the dressed side down. When a similar lumber is rough on all sides the side of the piece nearest the heart of the log should be down. This will retard the checking of the lumber and the opening of shakes in course of seasoning.

In piling of lumber 2 inches and under and of miscellaneous lengths the entire pile should be of the same length from front to rear as the longest piece of material in the pile. Thus if 1-inch lumber 8 to 16 feet in length is being included in the same pile, that pile should be 16 feet long and should be even at both ends. This is accomplished by bringing the ends of the shorter length alternately to the front and rear of the pile. By this method a ragged appearance of the rear of the pile is avoided and there is no waste due to warping and checking of ends of longer length projecting from the rear of the pile unprotected.

All rectangular sizes 5 inches in thickness or over, whether rough or dressed, should be piled on edge. This includes car sills, car framing, etc., guard rails, caps, stringers, bridge and switch ties and heavy joists of thickness above mentioned.

All piles of 1-inch boards, poplar and hardwoods of all thicknesses, dressed car flooring, and 2-inch plank not under roof, should be protected from sun and rain by covering of rough boards laid in two courses with the cracks in the lower course lapped by the boards of the upper course. This cover should be laid upon strips so that it will be about 6 inches above the top of the pile at the front and 2 inches at the rear. Care should be used to have this cover always in place.

In removing lumber from piles in the yard, that which has been on hand for the greatest length of time should invariably be taken first. Lumber should always be taken from the top of the pile and in no case should workmen be allowed to break into the side of the pile to avoid effort of going to the top and removing and replacing the cover.

Care of the Yard

The lumber yard should at all times be kept free from refuse and accumulation of material other than lumber. All piling strips and car stakes not in use should be collected and a proper place for them provided. The piling strips should have reasonable protection so that they will be dry and sound when wanted. Under no circumstances should decayed lumber be used for piling strips.

No decayed lumber should be allowed to remain in the lumber yard, and any decayed material received should be removed to a place apart from the good lumber and destroyed or disposed of as soon as possible.

The lumber yard should be kept clear of all weeds and grass, as these not only promote decay in the lumber but, when dry, add to the fire risk. The removal of weeds and grass can most efficiently be accomplished with a weed hoe, but the growth can sometimes be retarded by a strong salt solution sprinkled freely about the ground.

Fire Protection

Wherever possible the lumber yard should be protected from fire by a system of water mains and suitably located fire hydrants and hose houses. In addition to these a number of water barrels should be placed at convenient points throughout the yard for emergency use. A fire pail should be kept at each barrel and the barrels should at all times be kept filled with water. This can be prevented from becoming stagnant, as well as from freezing, by dissolving into each barrel from 50 to 100 pounds of salt. These barrels should be kept covered at all times, by a removable board or metal cover, to retard evaporation, and should be painted periodically to preserve the barrel. Red paint is recommended for the barrels in order that they may be conspicuous.

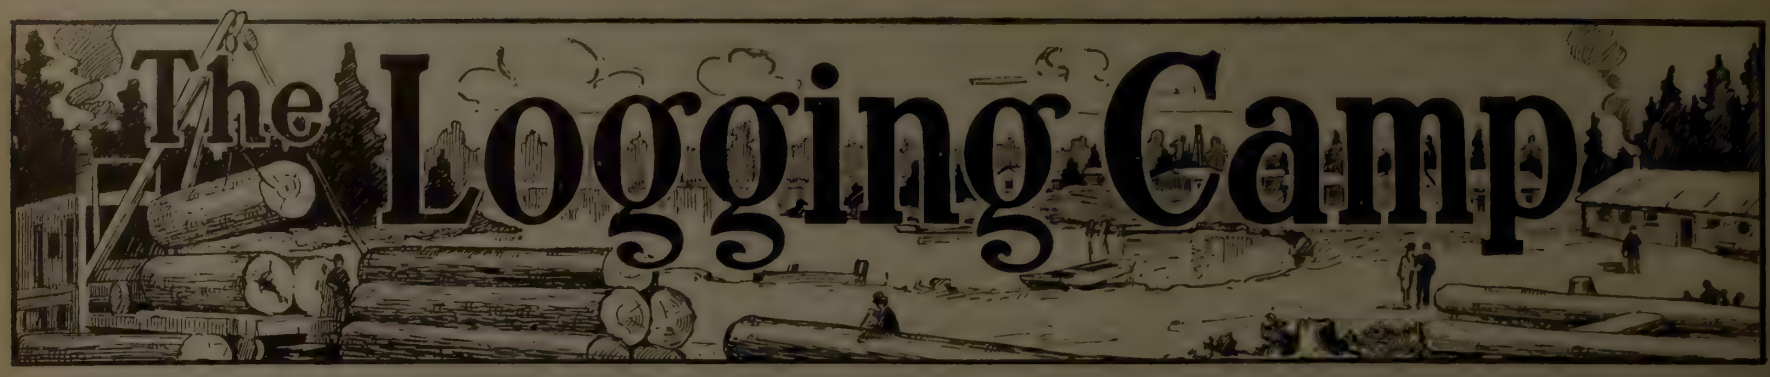
Where no water pipe system is available a barrel should be provided at least every 100 feet along each track throughout the lumber yard.

Creosoted Water Pipe Making Headway

A wooden water pipe 10.440 feet long and 12 feet in diameter will be used in a power development project in New York State. Douglas fir staves equivalent to 1,800 000 board feet of lumber will be used in the construction of the pipe line. 3.500 feet of which will be of creosoted material and the balance of untreated wood. The creosoted portion will be laid in the portions of the line where the head is not sufficient to ensure perfect saturation of the wood by water. In the other sections where the wood is saturated, creosoting is not considered necessary, since thoroughly water-soaked wood is not subject to decay. There has been some popular prejudice to the effect that the taste of water is affected by the use of creosoted wooden pipe. but a series of exhaustice investigations conducted by the Bureau of Industrial Research of the University of Washington in co-operation with the water and engineering departments of the city of Seattle and several industrial concerns has shown that water running through creosoted wooden pipes does not acquire any foreign taste therefrom after the first two or three days of use, and other tests have demonstrated that, after thirty years of continuous service in water, creosoted wood retains approximately 70 per cent. of the quantity of oil.

The annual meeting of the Western Retail Lumbermen's Association will be held at Winnipeg, on January 23, 24 and 25. The program for the convention has not yet been completed, but Secretary N. G. Neill advises that "it will embody an extensive exhibit of building material and comodities which retail lumbermen handle or should handle."

A despatch from Seattle, Wash., states that the spruce sawmills of Washington and Oregon may be taken over by the Federal Government for the production of airplane stocks to the exclusion of other lines. This proposition is largely the result of co-operation offered by the Lumbermen's Protective League.



Conservation of Food in Logging Camps

By W. C. Ruegnitz, Bridal Veil Lumbering Co., Portland, Ore.

My introduction to camp life several years ago was as a timekeeper and commissary clerk. My bunk the first night was a floor of earth under a tent which was so uncomfortable that I got up when I heard the cook swearing because he could not get his fire started with wet wood—I helped the cook. From that time until now I have been closely associated with the care and feeding of men in camps.

My mother's training after the Civil War was one of economy and carefulness founded on necessity, and she taught her children that waste was a great sin. When quite young I helped at home and did much of the marketing. Comparison of the conditions at home with camp life raised the question—Why is it necessary to buy so much food for the number of meals we are serving. And an analysis of that question is more in order now than ever before.

The chemistry of cooking and food combinations are being developed to such an extent that the logger will soon discuss food values and will know how many calories are required to keep the human machine working efficiently.

To feed the logger it is necessary to combine food supplies, cook house and cook—and any part of the combination that is not in working order will cause trouble.

The average cost of labor in a logging camp today is about 40 cents per hour. The average cost of feeding the logger on the same basis is 10 cents per hour—which is to say, 25 per cent. of the labor cost is the cost of feeding.

Are you giving your camps the proper proportion of consideration? I will take up the conservation of food under the following general heads:

The Cook and His Workshop.

The Buying and Storing of Food Supplies and Accounting for Supplies.

Plate and Table Waste.

Garbage Pail Waste.

Recipes, Menus and General Suggestions.

Before it is possible to operate a camp properly the kitchen—the cook's workshop or laboratory—must be provided, and in order to aid in saving it must be well considered. The kitchen and its equipment must be large enough to properly handle the work to be done. You cannot expect a cook to handle 100 men with a 50-man kitchen, but this is too often the case and is a reason for food being thrown out, there not being store room enough to care for it for another meal.

Too little attention is paid to the cook's living quarters. If anyone in camp needs a bath it is the cook. Give the cook the proper place to work—a clean place for himself and his crew—and it will reflect in the meals he serves.

I will not attempt to go into details regarding the requirements of a properly equipped kitchen because every camp requires a different handling. However, as a general rule, if adequate stove space and oven room is furnished, together with proper equipment for washing dishes, etc., the kitchen crew will do their work easier and will save more food than in a poorly equipped kitchen.

Along with the kitchen the dining room should be one that is cheerful. The seating capacity and width of tables, together with the coverings and dishes, should be considered with the end in view of making the room attractive and homelike. The man who eats his food slowly eats less and gets better results from the food consumed than the man who bolts his meal in a hurry. Would it not be a good idea to put a gramophone in the dining room and have suitable records played? A few well-considered pictures would be in order on the dining room walls. A flag in a conspicuous place with a large placard, "Your Flag and Mine," should be in every dining room.

A cook's work usually takes from early morning until late at night every day in the week. It is very desirable to arrange to give the cook a vacation often enough to prevent his getting stale on the job.

Buying and Storing Food Supplies

It is hard to give any particular rules which will apply to the buying of food supplies. A careful study of local conditions, together with the season of the year and the personal equation of the cook in charge of the camp, is necessary in order to buy properly.

Some cooks are able to handle certain classes of food supplies to far better advantage than others. Too often orders for food supplies are placed by inexperienced camp clerks. Sometimes they are placed by the cook himself.

When food is bought in large quantities and stored within easy reach of the cook, the natural tendency is to be careless because it is so handy to go and get some more.

When the food has been purchased the next step is to properly take care of it before it is used. There is no need to go into details with reference to this feature. An inspection of most store houses brings out the fact that there is a considerable waste here that could be eliminated, and it requires the personal, intelligent attention of a reliable man. It is something that should be watched carefully every day.

In order to buy food properly one must know exactly how much food is required for a given number of men, and in order to simplify records and put them in common terms, it appears that to reduce all records of food supplies used to the term of "pounds per man per meal" is desirable. A standard report suitable for the use of all logging camps can be made and the resulting comparisons these reports will give would be very beneficial. Reports could be had from all of the camps from the Northwest which would show the number of pounds per man per meal required. With these reports standardized they will of themselves point out ways and means of eliminating waste. My opinion is that if food supplies are properly handled there is no necessity for using more than two pounds per man per meal. Getting out reports on this basis is a foundation toward a more scientific record in terms of calories and other classifications that will be developed as soon as education along these lines becomes more universal.

Before leaving the question of accounting for food served I wish to emphasize the necessity for keeping record of all the meals which have been served. The idea is that leaks of any description must be stopped. What we want to know is that the food that is purchased goes into the man's stomach and not elsewhere.

Table and Plate Waste

There is a big difference of opinion with reference to placing food on the table. The general practice in camps is to place all of the food on the table and let the logger help himself as he sees fit. Some argue that full dishes point toward waste. Others argue that if the dishes are not well filled the logger thinks there is a limited supply and with his eyes larger than his stomach he fills up his plate so as to be sure to have enough for himself, with the result that there is some left on his plate which cannot be used. Here again is an opportunity for individual handling in the camps by the man in charge.

Attractive posters gotten up in the way to appeal to the logger could be placed in the dining room requesting the men not to leave food on their plates—to stir the sugar into their coffee—that to leave sugar in the bottom of the cup is a waste.

The number of meals served has a considerable bearing on the amount of food that would be eaten as well as the satisfaction given. Many people are unable to eat very much breakfast and before noon they cannot work properly. To provide for this it is well to give the logger a sandwich to take out to the woods so that he may eat whenever he feels the necessity.

Often times where careful reports of camp operation are kept it is found that too much food is being used. If an inspection of the garbage pail is made one can quickly determine certain sources of waste.

In one camp that the writer is familiiar with there was practically nothing in the garbage pail to feed the hogs except egg shells. It was noted that the cost of meals in this particular camp was much lower than in the neighboring camp where the hogs were very fat.

It has been suggested that suitable menus be gotten up for the purpose of distribution among the camps so that standard regular meals would be served. I do not believe this is in order because of

the varied training of our cooks. Also the number of men to be fed has an important bearing on this feature. It is in order, however, to give the preparation of food and the training camp cooks much thought from the standpoint of university training.

The kitchen is a laboratory and the preparation of food is a branch of chemistry which should be taken up by higher educational institutions. We should have university graduates for cooks as well as university graduates to do our engineering and other scientific work.

I will not attempt to go into the discussion of recipes. There are thousands of ways to save, and there is absolutely no excuse for anything being wasted in camp. Even bacon rind can be used as a food by special preparation. Bread scraps, hot cakes, etc., are frequently found in garbage pails, but if oven space is provided these foods can be dried and ground up and used again. There seems to be a universal dislike toward hash, which is a common way of using up left-overs. This dislike was undoubtedly founded on the fact that the men had been served with hash that is not fit to eat. It is too often the case that a cook will leave his left-overs until at least part of the supplies have spoiled or soured and when made into hash the taste is reflected and no amount of seasoning will eliminate it.

As a summary of the above the importance of giving your cook a proper workshop, the careful buying of food supplies, standard reports, and technical training of men for the position of cooks should be emphasized.

Winter Schools in the Logging Camp

By A. H. Powers, General Manager Smith-Powers Logging Co.

As to the possibility of winter schools in camps: In my mind, if the right kind of a teacher could be had—it all depends on that—winter school in the camp might do considerable good. You realize as well as I do that your teacher must be a practical man who has done all this work himself. A man who is a good talker and organizer is the man, in my opinion, that would make a good teacher for foremen, hooktenders and timekeepers. This man should be able to fill the position of a superintendent in a logging camp.

It would be useless to send out a man to the various camps to instruct men if he were not a practical man himself and who could explain as well as do any of the work that is to be done in the woods and also be able to teach it. There is a question in my mind if there are many men today who have positions, that you could get to do this work and who would be capable of instructing the men.

In my experience on the Pacific Coast with labor, it is entirely different from what it was when I was employing 1,500 men or more in the East. There never was a time in the East that I did not have a considerable number of men who would make good foremen that were working at different kinds of work in the camps. I have found it very different on the Coast. Most of the men nowadays want to do as little as they can and get all the money possible for it without taking any interest at all in the company's business, and they would just as soon destroy lines, blocks and machinery as they would to take care of it and keep everything going in good shape. The class of men today are very different from those who worked in the woods twenty years ago and longer.

At that time every man in the camp used to take an interest in his work, and see how much he could do. They started early in the fall and would never leave the camp until the river driving started in the spring. They would stay and drive the logs out without a man ever leaving the camp unless he was sick or hurt.

Today the majority of the men seem to want to have a few dollars ahead and then lay off to spend it. If there is any way in which men can be taught to save their money and try and earn what they get, I would be very much in favor of anything that anyone could suggest to see if a change could be made.

I have tried every way possible to get men to save their money and grow up with the business so that there would be a chance for all good, capable men to better their positions and increase their earnings.

While I am very much interested in the welfare of our men, and also interested in educational matters for the benefit of our men and in bringing closer relationship between the employee and the employer, I have always been in very close touch with our men and made it a point to always spend the time to take up all grievances and talk over and adjust any imaginable wrongs which they may have.

I would also state that superintendents and foremen must keep in close touch with their men at all times, and see that they have the proper equipment to work with, and see that they are properly taken care of in a bodily sense.

Clean, sanitary camps and plenty of well-cooked food are essential to the welfare of an organization.

The idea of a course of training for cooks is worthy of consideration.

The probability of winter schools for foremen, timekeepers, hooktenders and all special men will probably meet with the approval of the majority of loggers.

In my experience I have always noticed that the young men who start out in life and make good, are the men who take a great deal of interest in their work, and who try to do all in their power to get work done and accomplish good results. The man who makes good is the man who always tries to get more accomplished each day by profiting by his previous experience and mistakes. He must figure the best possible way to get work finished in the easiest and cheapest manner. A man in the woods must learn his lesson as well as the man in school. If he does not he will not make good, for he will not know how to do what he is expected to do if his lesson is not learned.

After any young man has had engineering experience, he should go into the woods and work at all kinds of work that is to be done, and acquaint himself with all branches of the work, so as to be able to take any new man and instruct him in every possible way to do woods work in the best manner.

If a young man has the ability to be a leader of men, and is a close student of work, he should in five years be able to learn a great deal about the logging business, and by having engineering experience before he goes into the woods, be able to combine his theoretical knowledge with practical experience, and make himself a valuable man for the logging industry.

Many of the problems that logging engineers will come in contact with in the rough country along the Pacific Coast will require judgment gained only by hard work, both physical and mental.

I will assure any young man who undertakes to make a thorough woodsman of himself that he will learn a great deal more in the second five years than he did in the first five years, and will continue to learn as long as he is actively engaged in the business, for the reason that conditions are continually changing, and a thorough study must be made of each change.

Falling and Bucking Logs

By A. R. Baker, Hammond Lumber Co.

It has been our aim the last few years to endeavor to increase the efficiency, as well as the economy, of falling and bucking our timber. In order to arrive at a greater degree of efficiency, during the year 1915 we decided to try an experiment by installing the VanOrsdel system of bonus for fallers and buckers. At the end of the year 1916, after using the bonus system the entire year, we found we had decreased the cost of falling and bucking from ten to twenty per cent. as compared with the previous year.

During the present year we have found a great many men who do not want to work on the bonus plan, on account of their not caring to exert themselves to their greatest efficiency, yet we have not given up the idea of the bonus plan.

By having a good head-bucker, he is able to instruct the men where to fall the trees to save them the best. He is also a great help to men only partially experienced, should they be willing to co-operate with him. We find that we are able to save our timber better under the bonus plan than under the day's-pay plan. Under the old day's-pay plan, if a man was enough of a politician to get the head-bucker to place him on the highest priced position, it was sometimes hard to find out who was not producing enough logs. Under the bonus plan, providing you can get a fair scaler and head-bucker, it is easy to determine if a faller or bucker is an expert in his business. We will admit that it seems to be harder to break in new men under the bonus plan than it is with the day plan. There seems to be individual pride among men that they like to earn a bonus, where you offer a bonus, or they do not feel inclined to stay at their positions.

Under the bonus plan we have foound that it was not necessary to keep as many fallers and buckers in a camp as it was under the day's-pay plan. This we consider an advantage, as we do not have these extra men to board and haul to and from work.

In the future we expect to do our falling and bucking either by so much per thousand, or pay bonus on the plan of so many square feet sawing making a day's work. We are convinced that probably the piece work is the best solution for this problem.

On the other hand, we think the bonus system is a benefit to both the employer and employee, if an arrangement can be made where neither party will suffer any injury.

Hoo-Hoo to Send Tobacco to Forestry Regiments

The Concatenated Order of Hoo-Hoo have decided to establish a bureau to collect funds for providing tobacco and other comforts for the men of the United States and Canadian forestry regiments and for other lumbermen who have enlisted and gone overseas. The order has dcided upon this course at the request of many lumbermen. A bureau has been established for this purpose at 1218 Wright Building, St. Louis, Mo., in charge of E. D. Tennant, secretary-treasurer of the Concatenated Order of Hoo-Hoo.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) $2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted—Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Wanted

Large size Elm Logs wanted. Address P. O. Box 5, Papineauville, Que. 21-2

Wanted

4 cars Sawdust, 3 cars Spiles, 5 cars Hemlock or Cedar Ties, 2 cars Cull Basswood, 6 cars Cordwood, a number of cars Hardwood or Softwood Slabs. Apply Box 637, Canada Lumberman, Toronto, Ont. 20-23

Wanted—Lumber

Slabs and Edgings—Hardwood and softwood; five to five hundred cars, for cash. Box No. 641, Canada Lumberman, Toronto. 21-24

For Sale—Lumber

For Sale—Inch and two inch Spruce, widths piled separate.

Hendun Lumber Company, Limited,
23-23 Haileybury, Ont.

FOR SALE—Ten cars Heavy White Oak Ship Timbers for immediate delivery. Apply

Georgian Bay Shipbuilding Co.,
22-1 Midland, Ont.

Lumber For Sale

Two cars 4 x 4 Maple Boxed Hearts.
One car 5 x 5 Maple Boxed Hearts.
One car 6 x 6 Maple Boxed Hearts.
Seven cars Fir Doors.
Three cars Fir Columns.

GEO. C. GOODFELLOW,
23-23 Montreal, Que.

For Sale—Machinery

Slab Resaw For Sale

Heavy Horizontal Slab Resaw, Giddings and Lewis Make, 6 ft. wheels, 8 in. saws; used only four months.

FIRSTBROOK BROS. LTD.,
20-23 Toronto, Ont.

Steel Rails For Sale

A small quantity of 20 lb. light re-laying rails, for sale for immediate delivery. Apply Box 650, Canada Lumberman, Toronto. 23-24

For Sale

One 3-roll 52-in. Berlin Sanding Machine. Used only few weeks.

THE BEAVER BOARD CO.,
20-23 Buffalo, N.Y.

FOR SALE—5/8 in., 3/4 in., 7/8 in. diam. wire rope, in lengths from 50 to 200 ft., suitable for guying purposes or for making booms, 4c per foot pet in any size or quantity.

H. W. PETRIE, LIMITED,
22-1 Toronto, Ont.

For Sale—225 H.P. Corliss Engine with 250 volt, 600 ampere, 150 k.w. Northern Electric dynamo and switchboard and connections and a quantity of copper wire. Fairbanks Morse underwriters fire pump, 16 x 9 x 12. Two boilers 72 x 16.

J. C. NOLEN,
23-23 Muskegon, Mich.

Machinery For Sale

1 Goldie & McCulloch Engine, 16 in. x 38 in. Complete with Heater, Pipes, Oil Pump, etc. In first-class condition.
1 Holmes Matcher.
1 Band Rip Saw.
1 Dynamo Engine, Jewel No. 3.

R. Laidlaw & Co., 65 Yonge Street, Toronto. 19-23

For Sale—Cheap

One semi-portable saw mill, consisting of nearly new Jenckes Machine Company 40 H.P. firebox boiler with stack; 35 H.P. engine; three-saw edger; two saw trimmer; carriage, with set works, rope feed and track; sawdust conveyor; cut-off saw; shafting, pulleys, belting, etc.; two 56-in. Atkins saws used one season; automatic saw gummer; and some railroad iron and car. Located near Sault Ste. Marie, Ont. May be shipped by water or rail.

Write Herbert E. Stiles, 436 Ethel Street, Grand Rapids, Mich. 22-23

Planing Mill Machinery For Sale

Only in use for 18 months and almost as good as new.
1 Q. Y. Matcher, Gourlay.
1 Butting Saw, Gourlay.
1 Rip Saw, Gourlay.
1 Sticker, Ballantyne.
1 Scroll Saw, Ballantyne.
1 Surface Planer, Gourlay.
1 Heavy Band Resaw, Cowan.
1 Emery Grinder.
1 Large Fan, McEchran.
1 40 H.P. Westinghouse Electric Motor.
Saws, knives, dressing heads, etc., etc.

OTTAWA LUMBER COMPANY,
22 Metcalfe Street,
22-1 Ottawa, Ont.

Wanted—Machinery

Wanted—Circular Slab Resaw, second hand, in good condition.

York & Sunbury Milling Co., Ltd.,
23-2 Fredericton, N.B.

We are in the market for the following second-hand equipment: Power plant for fifty-foot, shoal draft tug boat; double engines preferred; one slab resaw; one double saw, automatic feed; tie mill. Address with full particulars and price,

Reamsbottom & Edwards,
22-1 Connaught Station, Ont.

Refuse Burner Wanted

Second-hand Refuse Burner in good condition, 12 to 15 feet in diameter, and moderate height. Address with full particulars and price.

REAMSBOTTOM & EDWARDS,
20-21-22 Connaught Station, Ontario.

Wanted—Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Thoroughly competent lumber salesman is open for position with good firm on road or in office. Box 650, Canada Lumberman, Toronto. 23-24

YOUNG MAN, six years' experience as stenographer and bookkeeper in lumber business, desires change. Best of references. Box 629, Canada Lumberman, Toronto, Ont. 19-2

Position wanted by man of experience in both wholesale and retail lumber trade. Well acquainted also with the travelling end of the work. Available at once. Can furnish excellent recommendations. Apply Box 642, Canada Lumberman, Toronto, Ont. 22-1

Manager with best of references from present and past employers desires to make a change. Eleven years' experience in lumbering, estimating, milling, mapping, river work, purchasing and office duties. Technical education as engineer and forester. Box 647, Canada Lumberman, Toronto, Ont. 22-23

POSITION WANTED—As office manager or accountant with lumber and woodworking business; 15 years with one large Ontario concern; 5 years as treasurer and office manager. Practical knowledge in all departments of business; aggressive and up-to-date methods. Age 48; best credentials. At present engaged, but desire opportunity with large concern where advancement is assured as reward for ability and services. Apply Box No. 648, Canada Lumberman, Toronto, Ont. 22-23

Wanted—Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

First class bookkeeper for lumber and planing mill business. Young married man with thorough knowledge. Commencing at New Year's. State salary and give experience. Box 652, Canada Lumberman, Toronto, Ont. 23-1

WANTED—Man with knowledge of stenography and a little office experience, able to do invoicing and inventory work, to act as assistant to Superintendent of Sawmill. Good opening and year round employment to right party. Box 644, Canada Lumberman, Toronto, Ont. 22-23

Business Chances

For Sale

About five or six tons of 5/8 and 9/16 tested chain in lengths from 27 ft. to 30 ft. with ring on one end and hook on the other end. Address Drawer "F," Sarnia, Ont. 19-t.f.

For Sale

2,000 acres well timbered bush in township of Sinclair, new mill, stable and camps. Loading point, Huntsville. Reason for selling, ill-health. Apply to

HOLINSHEAD & ROGERS,
21-24 Huntsville, Ont.

Mill Plant and Limits For Sale

43 Miles Limits on 31 Mile Lake, Gatineau Valley, containing Basswood, Spruce, Fir, Pine, Cedar, Birch, Maple and Pulpwood.

New Waterous 8 ft. Improved Double Cut Band Mill complete. Steam Alligator, Boats, Sleighs, Wagons, Harness, etc. For further particulars apply to

A. W. STEVENSON,
P. O. Box 2624,
8-t.f. Montreal, Que.

Tide-Water Stumpage For Sale or Exchange

For sale, or will exchange for good ranch or farm land, B. C. Tide-water stumpage, cruised and surveyed.

CARL BLOCK,
19-t.f. Peoria, Illinois

Sale of Timber

Tenders will be received by the undersigned up to and including Monday, the 3rd day of December next, for the right to cut the timber on a portion of the Township of Idington in the District of Algoma, and a portion of the Township of Owens in the District of Temiskaming, situate on the line of the National Transcontinental Railway.

The area upon which the timber in Idington and Owens Townships is offered for sale comprises 10 acres off the front of each lot in the said Townships, and in addition the road allowance between the several concessions therein. This may more particularly be described as follows, viz,—being a strip of land 8 chains 92 links in width, or being 4 chains 46 links measured at right angles on each side of the centre line of said road allowance.

Terms and Conditions of Sale

Tenderers will state (1) the amount they are prepared to pay for Pine and other timber respectively in addition to Crown dues of $2 per thousand feet board measure; (2) the amount per tie in addition to Crown dues of 5c each for such timber as may be suitable for making railway ties; (3) the rate per cord for Spruce pulpwood in addition to Crown dues of 40c per cord; (4) the rate per cord for other timber suitable for pulpwood such as Balsam, Jackpine, and Poplar in addition to Crown dues of 20c per cord; (5) the rate per cord for cordwood for fuel purposes in addition to Crown dues of 20c per cord.

1. The successful tenderer shall cut and dispose of all underbrush and shall also dispose of all debris caused by cutting and removal of the timber hereinbefore mentioned, said cutting and disposal of underbrush and debris to be under the supervision and performed to the satisfaction of an officer or officers of the Department of Lands, Forests and Mines, all cutting and other work to be completed by 1st day of June, 1918.

2. The timber is to be sold subject to the Manufacturing Condition, that is to say, it is to be manufactured in the Dominion of Canada.

3. Tenders to be for each Township separately. Each tender to be accompanied by a marked cheque for $2,000.00, payable to the order of the Provincial Treasurer, the deposit to be held by the Department to insure proper compliance with all the terms and conditions of sale.

4. The sale to be subject to the Crown Timber Regulations, excepting in so far as the same may be inconsistent with any conditions herein specified, and to such Acts or Orders-in-Council as now exist or may hereafter be passed affecting timber or territory under timber license from the Crown.

The Department does not bind itself to accept the highest or any tender.

Tenders to be addressed to the Minister of Lands, Forests and Mines, Toronto, and marked "Tender for Timber."

Maps showing the Townships may be obtained upon application to the undersigned, or from Mr. Geo. A. Bremner, the Crown Timber Agent, at Cochrane.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.
Toronto, October 30th, 1917.

N.B.—No unauthorized publication of this notice will be paid for. 23-24

Horses For Sale

For Sale—Ten teams of heavy Horses with harness.

Canada Pine Lumber Company, Ltd.,
23-23 Kearney, Ont.

Jobbers Wanted

We wish to let several contracts to take out logs on Berth No. 6, being broken front lying between the Magnetawan and French Rivers. This berth is all convenient to Canadian Northern Railway.

John Harrison & Sons Company, Limited,
Saw and Planing Mills,
9-t.f. Owen Sound, Ont.

FOR SALE
as a Going Concern
Saw Mill and One Hundred Square Miles Crown Lands

Mill capable of sawing eight million superficial feet per year. New boilers, good engine and pumps, gang and rotary shingle and lath machines and planer. Railway siding in yard, also water shipping.

This property is situated in a thriving centre where labor is available. Good general store, boarding house and other buildings in connection with property. Good reasons given for selling.

No one need apply except bona fide purchasers.

Apply, Lumber, Box 643, Canada Lumberman and Woodworker, Toronto, Ont. 22-t.f.

TENDERS
for Pulpwood Limit

Tenders will be received by the undersigned up to and including the seventeenth day of December next for the right to cut pulpwood and pine timber on a certain area situate in the vicinity of the Kapuskasing River in the Districts of Timiskaming and Algoma.

Tenderers are to offer a flat rate per cord for all classes of pulpwood, whether spruce or other woods. The successful tenderer shall be required to pay for the Red and White Pine on the limit a flat rate of $10 per thousand feet board measure.

The successful tenderer shall also be required to erect a mill or mills on or near the territory, and to manufacture the wood into pulp and paper in the Province of Ontario, in accordance with the terms and conditions of sale which can be had on application to the Department.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for Twenty-five Thousand Dollars ($25,000.00), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said Twenty-five Thousand Dollars ($25,000.00) will be held by the Department until such time as the terms and conditions of the agreement to be entered into have been complied with and the said mills erected, equipped and in operation. The said sum may then be applied in such amounts and at such times as the Minister of Lands, Forests and Mines may direct in payment of accounts for dues or for any other obligation due the Crown until the whole sum has been applied.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.
Toronto, September 19th, 1917.

N.B.—No unauthorized publication of this notice will be paid for. 20-24

New Crown Land Scaling System for British Columbia

A Vancouver despatch states that by a new system which went into effect on Oct. 1, all timber cut on Dominion lands, chargeable to crown dues, will be scaled by an employee of the Department of the Interior. This announcement was made by Mr. E. Walmsley, assistant crown timber agent. As a severe penalty is provided in cases where such timber is sawn without first being so measured, licensees of timber berths and contractors are being notified by the Crown Timber Office, and every effort is being made to give the widest possible publicity to the change, which has been made with the object of improving the service to the public and giving the department control over the measuring of timber in which they are interested. Hitherto, such timber has been scaled by employees of the various operators, who made a return every three months of the amount of timber logged, the dues payable being based on this return. Under the new system a fee of 5 cents a thousand for sawlogs, 5 cents a cord for shingle bolts, and 5 cents for every 200 lineal feet for piling and poles will be charged.

Pro-German Agencies at Work

Convinced that pro-German agencies are at work to hinder the aircraft production program, officials at Washington, D.C., believe a drastic campaign against agitators may be necessary, reaching to the spruce forests of the northwest. Numerous cases of sabotage have been reported from mills that are cutting airplane wood. Labor disturbances fomented by the Industrial Workers of the World have also been hampering the government in building swiftly the air fleets that are expected to strike a decisive blow at the German defense. The regularity with which accidents occur in various lumber mills convince officials that a definite sabotage campaign has been organized by hidden enemies which must be stamped out.

Notes on Saw Sharpening

To reduce the power consumed to the lowest limit, to save wood, and turn out the most and the best work requiring the least after finish, the saw teeth should be exactly adapted to the nature of the wood, and be alike in (1) shape, (2) length, (3) hook, (4) space and gullet, (5) setting, (6) bevel, (7) gauge, and (8) temper, so that they may each take their full share of work. This may appear a somewhat formidable list, but with a well-equipped and operated tool-room they can practically be secured.—M. Powis Bale, in "Saw Mills."

Review of Current Trade Conditions

Ontario

A number of reports recently received from large wholesalers selling to the Ontario trade agree that there has been an encouraging improvement in the retail trade during the past fortnight. Quite a strong demand has developed among the retail yards. No doubt this is accounted for largely by a general realization that prices are not likely to decline during the winter, but are more likely to increase. Many retailers in Ontario delayed about giving orders for their usual fall purchases, believing that prices were too high and would come down in the near future. This belief has not been justified up to date, but prices have been steadily advancing. In the face of this situation, retailers who now find their stocks very low and a fairly good demand from their customers, are coming into the market again, and trade which in normal years would have developed about a month ago is now coming out. Definite examples of this have been reported in numerous cases, the retailer being induced to loosen up by the fact that instead of getting lower prices he has lately been quoted advancing prices on stocks which he knows he will have to purchase to enable him to do his regular fall and winter trade. The farmers of Ontario have done well during 1917 and retailers find that there is a good demand for stocks from this quarter.

There have been quite a number of new shell box orders let recently for 4.5 in. and 6 in. shell boxes which will have an important effect upon the consumption of available stocks suitable for this purpose. The Imperial Munitions Board appears to be centering its orders for shell boxes in fewer hands than formerly; evidently placing orders as far as possible with the lowest tenderers and giving them as much business as they can handle, rather than scattering the business about the country with a large number of concerns. No orders are yet reported for boxes in connection with the shells to be manufactured in Canada for the United States Government.

The demand for lumber for various war purposes continues strong. There is a definite rumor in the air to the effect that the United States Government will shortly be requiring no less than 400,000,000 feet of white and red pine and spruce from Canada for its various war uses. No actual corroboration of this report is yet available, though it is known that representatives have already been making enquiries in Ontario as to available stocks and have been securing lists. The authority upon which this report reached the Canada Lumberman is so good that we feel that it should be published . If anything approaching this large quantity of pine and spruce is taken out of eastern Canada during the winter it is difficult to imagine where there will be any other stock left in the country.

Prices of all lines in Ontario continue strong and advances of $2 to $3 a thousand feet are reported in a number of cases. Price quotations, however, do not give much of an idea of actual market values which prevail today, as almost every transaction seems to be regulated by the urgency of the demand and the possibility of making shipment.

The latest reports from manufacturing points in northern Ontario are along the same lines as those which we have published in previous issues. Manufacturing costs this winter are certain to be exceptionally high on account of the scarcity of labor and its inefficiency, together with the high cost of all kinds of supplies. A number of important manufacturers will not operate this winter at all. Others are taking out a smaller cut than usual and on account of the labor scarcity even those operations which have been planned are being handicapped by difficulty in getting camps properly under way. The military service act is expected to take away quite a number of men from the woods and as the lumber camps have already furnished a large number of men for forestry battalions and for the combatant forces as well, this industry is certain to suffer more almost than any other. Lumber operators are unanimous in the opinion that the government ought to adopt a policy of exempting the few remaining men who are available for camp operations.

Eastern Canada

The lumber trade at Montreal is quiet, the commencement of winter conditions having caused the demand to weaken. On account of the small quantity of building operations under way, the market for building lines is very quiet. Shipbuilding yards also seem to have on hand sufficient stock for their present requirements, and there is only a little movement in this line, though unquestionably the trade in ship timbers will be more active in the near future. A few more orders have recently been let for small shell boxes. Factories using hardwoods and veneers for piano and furniture production are quiet and there is very little demand for hardwoods for interior trim.

The demand for export to the United States continues fairly active, but the trade is handicapped by the great scarcity of cars. The export season has now come to an end and the results, when they are available in tabular form, will show a great falling off as compared with former years.

At St. John, N.B., the lumber trade is almost idle. The only export shipments are small parcel lots for the Admiralty. There will also be a small quantity of stock shipped during the winter port season which commences about December 1st. The American and English markets show no decline in prices. No tonnage is available for shipping goods to the English market, and, therefore, there is no question of price. Cars for shipment to United States points are very scarce and the volume of this trade is small. The scarcity of labor is growing more pronounced daily, many men being taken on account of the Military Service Act. It is probable that a large quantity of stock which operators were counting upon taking out this winter will not be touched. Woods operations generally are far behind what was planned. Wages are advancing all the time and bushmen are leaving the camps every day.

Local trade at St. John is quiet and factory work is decreasing as the winter weather draws on. All the St. John mills will have closed for the season in a few days.

The demand for spruce at Boston is fairly good, and prices are firm, the government requirements being a strong factor in the situation. The reduced cut of logs and the high cost of production at the mills are also important factors in maintaining the firmness of the market. The building trade continues dull, and the same applies to the retail trade. There is still a lot of government work ahead for the mills. Similar conditions prevail in connection with spruce in New York. Hemlock is quiet at Boston, and the trade in dimension is very slight, spruce being substituted. The demand for hemlock boards is only fair. The shingle and lath markets at Boston are quiet. Lath in particular are dull.

Great Britain

The total stock of all wood goods in the Surrey Commercial Dock at London is scarcely half the quantity which was on hand a year ago. This is really not a matter for much surprise, considering the great difficulty there has been in getting steamers to carry cargoes to London. The result is, however, that London seems temporarily to be losing its position as the chief importing centre of the softwood trade. The decline has been gradual for the last twelve to eighteen months, and to-day the supplies include only a quarter of a million pieces of European deals, about a half a million pieces of battens, with Canadian spruce and pine in proportion. Rough boards appear in large quantity, but are mostly Archangel short ends, which do not add up to as much as might be thought, because of the small quantity they contain individually. Weekly deliveries are gradually decreasing.

Unfortunately, there does not seem to be any sign of improvement so far as importers are concerned, as the greater part of the business done is from government stock. Many importers are struggling along gamely, but there is a strong feeling that the softwood trade is being badly treated and the desire for greater freedom to trade is gaining headway.

Very little spot business is reported from Liverpool. Available stocks of softwoods are very light, but there is a promising volume of enquiries as to future business. The import of Quebec yellow pine deals at Liverpool during October was nil. The consumption accounted for 100 standards, leaving only 190 standards available in stock: Imports of Quebec red pine deals amounted to 90 standards and consumption was only 20 standards, leaving the stock at 480 standards. Quebec spruce deals show a slight increase in import, namely, 170 standards against 50 standards for the preceding month. The consumption rose by 100 standards and the stock has been reduced to 680 standards. Imports of New Brunswick and Nova Scotia spruce and pine amounted to 1,220 standards, but very little of this was for private account, practically all of it being for the government buyer. The consumption continues stationary at 640 standards. The stock has now reached 3,010 standards. Only a very small proportion of this stock, however, is held in private hands.

More encouraging reports are received from Manchester than from other lumber markets in Great Britain. There is a decided eagerness on the part of buyers to pay spot cash for anything they can secure. If there were liberty to import and the price limitations were

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

removed there would probably be a rush of trade. There is quite a volume of inter-trading between importer and importer and merchant and merchant, which seems to be a strong argument that the trade would be very active if it were not throttled. Reports are frequent of parcels changing hands half a dozen times, and always at a profit.

United States

There is a noticeable increase in the demand for yard stock in many parts of the United States, particularly in the West and South. Large stocks such as are required by the government are only obtainable for government use. Prices in general are firm, and in many lines they are advancing. A large producer of yellow pine states that there is a great demand for dimension stock, and that prices have advanced as much as $2 a thousand during the past fortnight in some instances; also that boards have advanced from $1 to $2.50 per thousand. The car shortage continues to dominate the whole lumber situation. In the Southern pine districts the demand has increased, while shipments have decreased, and now the yards are adding their demand to that of the government. Price advances varying from 50 cents to $1.50 are reported in connection with most lines of Southern pine yard stock. No evidence of relief in connection with the car shortage has yet been reported from any district. The United States Government is reported to be about to call for Southern pine to the extent of 300,000,000 feet for the construction of knockdown houses for the use of troops in France. The government demand seems to be the most important factor in connection with the North Carolina pine. Prices are firm for practically all lines, except those controlled by the government, and at some consuming points stocks are scarce. The government recently announced a reduction of $1 a thousand on 2 in. dimension No. 1 common and 50 cents on 2 in. dimension No. 2 common. There is also an unconfirmed rumor afloat of a substantial reduction on government lumber for cantonment purposes.

The demand for Douglas fir is greater than the available supply. All prices are reported to be firm and some of them advancing. The transportation situation is exasperating, being characterized by scarcity of cars and frequent embargoes. The railroad demand is somewhat more active and there are heavy orders for special cutting, chiefly for shipyards and railroads.

The demand for hardwoods is strong generally, and particularly so for poplar, oak, and chestnut. Ash also has been in great demand. With the exception, however, of the business done with the government the general hardwood market seems to be somewhat erratic.

An extensive wholesaler at North Tonawanda reports that the lumber trade there is somewhat slow and uncertain. Embargoes and shortage of labor are making prices firm, and in some cases advances have taken place. Building operations are very light, and the furniture trade is quiet.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Trade Report—Outlook Encouraging

Ottawa, Nov. 21.—(Special to the Canada Lumberman.)—The Ottawa lumber market during the closing period of November has remained firm, and the indications are that this condition will continue. In some grades, especially those used in shell box manufacture, the prices advanced slightly. Enquiries for domestic or export business continued good and in some instances increased as compared with the opening period of the month. The freight situation has become easier, and stocks are moving more freely. General conditions in the woodworking plants and in the lumber mills showed an improvement as compared with October.

Lumber manufacturers, dealers, and brokers believe that prices are going to increase before next spring. The outlook, they say, is good. Stocks, especially for shell box manufacture, are becoming scarce. There was a good demand for export business. Good progress, considering the labor situation, is reported from the woods end of the various companies. From the best information the representative of the Canada Lumberman could secure, this season's wood cut will not equal that of last year.

New shell box orders for a large number of boxes have been granted to some Ottawa woodworking plants. Information as to the total amount of contracts let with Ottawa plants was not forthcoming from the Imperial Munitions Board. One report which the Canada Lumberman was unable to confirm was that one plant had secured an order for 128,000 boxes. The new shell box orders should keep the mills busy for the next two months or longer. The labor situation remained unchanged. A shortage of woods labor continued to prevail.

The McAuliffe-Davis Lumber Company secured quite a large new order for shell boxes, which will keep the plant busy for two months.

The Estate James Davidson also secured a large new order for shell boxes. The plant is operating almost to capacity during the day, and the new order will necessitate operation one or two nights per week.

The Hawkesbury Lumber Company reports the camp and woods operations are proceeding as well as can be expected, considering the labor shortage.

The Chaudiere sawmill of the John R. Booth plant closed for the season on Friday, November 16. Between two and three hundred men were affected. The closing of the sawmill also reduced the number of employees in the yards and the piling ground. Other operations with the Booth interests, excepting woods labor, are reported as satisfactory. The camps are now all in operation.

Gilmour & Co. repart the market firm and the demand increasing. They believe prices will advance before next spring. "There has been no weakening in the market of late," they say, "and the prospects are that it will remain firm and advance."

Business with the Shepard & Morse Lumber Company continues good, and an increase is noted in export sales.

The W. C. Edwards Company had not, up to November 21, secured one of the new shell box contracts. The old contract this plant was working on has been completed. About forty employees are affected. The sawmill operations, according to the report on this date, will cease before the end of this month. Export business continues good. There is nothing new to report from the camp and woods end.

Montreal Markets—U.S. Demand Satisfactory

Montreal, November 27 (Special to the Canada Lumberman):—Trade generally has slackened. With the advent of winter conditions, the demand locally naturally declines, and this year, with building negligible, the buying is on a very small scale. The paucity of building going on may be judged from the fact that last month the permits only totalled $227,033, a decrease of $125,091. Very little new work is in sight, and the local yards which supply many of the contractors are buying only from hand to mouth.

There is even a falling off in the demand for shipbuilding lumber. For the moment, the requirements have been largely filled, but no doubt there will be a revival in this branch of the industry.

Further orders for small shell boxes have recently been given out, although the quantities are not very large.

In hardwoods, business is quiet. Trades using hardwoods and veneers, such as piano and furniture factories, are not so busy as they were, while hardwoods for interior trim are meeting with a poor demand.

The brightest spot is the section shipping to the United States. Enquiries from over the border are satisfactory, the great drawback being the lack of cars. The situation is far from reassuring, both as regards cars for the United States and for domestic requirements, and as winter conditions become more severe we may look for a still further depletion in the cars available.

The export season is now over—and a very poor one it has been, the worst for many years. Only a limited amount of lumber was shipped during the closing days, although the lower ports are said to have been fairly busy. A report received in Montreal states that the British Government has purchased all the available 3-inch spruce stock, 1917 cut, in the Miramichi and around Campbellton, N.B. districts at a flat rate. In and around Campbellton alone over 100,000,000 feet have been sold, while the total will exceed twice that amount.

The pulp markets are steady. Busienss has hitherto been slow, but it is now picking up. Prices, however, have not moved to any extent.

St. John Trade Very Quiet

St. John, N.B., November 26 (Special to the Canada Lumberman):—At the present moment the lumber trade is dormant. No shipments are being made excepting a few small parcels by Admiralty boats. No doubt a certain amount will move during the winter port season, which is expected to begin about December 1st. Prices, both in American and English markets, are not shorinking to any extent. The English market is devoid of deals, but no tonnage can be had to move

the goods. Therefore it is not a question of price but how to get the deals across. The shortage of cars for American stock makes it very slow forwarding the material. Labor is becoming scarcer each day as men are being taken for war purposes. Many cuts which were expected to have been taken out this year will not be touched for want of help. The operators in general in the woods are away behind in their work; men are leaving every day and wages are going up. Local trade is only fair and as the winter draws near factory work is slowing up. In a few days all mills will have ceased the season's sawing.

Liverpool and Manchester Stocks

The United Kingdom Market for Spruce

The Timber Trades Journal, of London, Eng., in a recent issue says:—If importers have the courage or the rashness to speculate—and we are afraid that the latter term is the more applicable as long as uncertainty prevails as to the government's intentions—they could not do better than to put their money into Canadian spruce. The free-on-board price of the wood is much below the level ruling in the Russian and Scandinavian markets, and there will be a tremendously fine opening for spruce directly trade regains its freedom of action. Whitewood has become very much more valuable these last two or three years, and in the near future there will be very little competition from the cheap wood which was formerly shipped in large quantities from Riga. But we are afraid the times are too unsettled even for what would seem to be very promising ventures; for if the war continues, the tonnage handicap next season will be too severe, apart from the question of state control. There can, however, be little doubt that, should it be possible for private firms to ship next year, the purchase of spruce at the present time would be highly profitable. Should the war run well into 1918—and the government is bound to make provision for such a contingency—nothing can stop a further very appreciable rise in the value of wood all over the world. The Russions are talking of at least a 25 per cent. advance, and, as will have been seen from our Swedish correspondent's letter last week, the actual cost of the present production of sawn goods in Scandinavia has reached the extraordinary figure of 256 kronor per standard. With the high cost of living, which will continue to increase with the length of the war, labor will be more and more highly paid; consequently, commodities must rise in value in relation to money, and prices all round be on a more inflated level.

Boston Firm Recommends Caution

Correspondence received by the Canada Lumberman recently from a Boston firm of manufacturers and wholesalers states that trade conditions in the United States at present are quite dull, except for government work. "The building trade is almost at a standstill, and the higher prices go the less building there seems to be. The market is not flooded with lumber as it cannot be shipped, but we predict that if every man could get all of the lumber he has bought, shipped right in to him, he would be a good deal overloaded and would be sorry he had bought what he has. The facts seem to be that people buy and cannot get the lumber and then duplicate the order, hoping to get it from another place sooner, but do not countermand with the first party. If we had anywhere near our usual shipping facilities we believe the prices on lumber would drop very considerably, but it does not look as though we would have these facilities, so prices keep up and some are actually increasing still, and, of course, as the cost of production is still advancing, this is still necessary. However, we do not like the looks of the near future and believe extreme caution is necessary."

Wood Substitutes in Box Making

The shook box has probably lost ground to its competitors, the veneer box and the fiber container, during the decade 1904-1914 to an extent, measured in box material, of some 1,500,000,000 board feet of lumber annually, according to the United States Forest Service. The results of a study of this subject have been issued as Report 117 of the office of the Secretary of Agriculture. Shook box production increased between 1905 and 1912, the latest period for which reliable data are available, in the former year being 7,085,000,000 square feet, and in the latter 7,700,000,000 square feet, a gain of some 8 per cent. During the same period, however, the production of veneer boxes and packages increased from 100,000 to 1,500,000,000 square feet, a gain of 1,400 per cent., while the production of fiber containers also increased rapidly, the estimated production in 1914 being 331,760 tons, equivalent to 2,140,280,000 feet of 80-point board.

A large part of the replacement of shook boxes, of course, is by substitutes consisting largely or altogether of wood in other forms. Approximately 70 per cent. of the material going into fiber boxes is wood, and the veneer box and package are made entirely of wood. It requires less wood to make either a fiber or a veneer container, however, than to make a shook box of the same size.

The main reason for the substitution of fiber and the veneer container for the wooden box is their lower initial cost and lighter weight. It appears likely that there will be a gradual increase in the consumption of all classes of boxes. There would seem to be a logical field for each of the three main types, which will be more clearly defined when sufficient data becomes available to admit of the adoption of scientific specifications and shipping regulations.

New York State Retailers to Systematize Cost Accounting

An important step has been taken by the Retail Lumber Dealers' Association of the State of New York in connection with cost accounting. A committee appointed by the association has contracted with a firm of organization experts and industrial economists to furnish the association with a standardized system of cost accounting for the use of its members on both the yard and the planing mill end of their business. The firm undertaking the work is that of Hanks & Gregg, Chicago, of which Mr. I. B. Hanks, one of the members, is a practical lumberman. It is thus expected that the system will combine both simplicity and extreme practicability.

The New York State Association have taken a foremost place among associations of lumber dealers, as is shown by a resolution which they carried in conection with the above arrangement. The wording of this resolution was in part as follows: "That this association shall continue its policy of systematically fostering group meetings of dealers on a local district basis as conditions may warrant, for more effective co-operation with this association and with each other in the study of general and local trade problems and methods of doing business; and that this association shall co-operate with both the city and small town dealers by making suggestions through its officials for constructive service tending to remedy trade evils. We especially emphasize the necessity of a more accurate knowledge of the cost of doing business and of the use of better methods to ascertain such costs."

Russia: The World's Timber Yard

In a recent issue of the British Paper Trade Journal reference is made to the timber wealth of Russia in the following words: "To the man whose interests necessitate his keeping constantly informed of the timber and pulp supply of the world, the story of the Siberian forests—but one phase of its many naturally endowed potentialities—ought to read with unwonted attraction. Already the lumberman is beginning to turn his eyes from the Scandinavian peninsula towards Russia. Russia to-morrow will be the world's timber yard, for there are no less than two-fifths of the empire in forest land. In European Russia the forests extend over an area of about 345,000,000 acres, of which 214,500,000 acres belong to the state, 88,000,000 to individuals, 26,000,000 to peasants, and 11,000,000 to the crown, leaving 6,000,000 acres under diverse ownership. In Asiatic Russia most of the forest land belongs to the state. A conservative estimate puts it at 636,000,000 acres, a low figure when it is remembered that much of the land is as yet unexplored. Thus vast reaches of the timber belt in the Yakutsk Province, bordering on the Arctic, which have never known the foot of civilized man, are roughly reckoned at 90,000,000 acres. The same is true of the vast forest areas in Eastern Siberia. It is safe to say that two-thirds of the timber land in the Russian Empire lies between the Urals and the Pacific. Of the total 636,000,000 acres owned by the state 239,500,000 are being worked directly by the government, with a yield of about 300,000,00 cubic feet of timber."

Export Embargo Lifted

After having placed an embargo on the exportation of lumber from the Pacific Coast, and following a request by the West Coast Lumbermen's Association, that this embargo be lifted with the understanding that no material suitable for government purposes would be exported, the authorities have raised the ban on the exportation of such wood from the Pacific Northwest ports. The Assistant Director, Bureau of Exports, Washington, D.C., wrote the Association on this point as follows: "After carefully considering the requirements of commerce, of the emergency fleet corporation, the navy and the airplane division, the war trade board has decided to release the vessels now loading and to be loaded and will permit them to proceed to sea. This is done with the specific understanding that your association will place an obligation upon each of its members to deliver lumber to the Hog Island navy yard, the airplane building stations and the companies having contracts with the emergency fleet corporation of wooden vessels, giving priority over all other orders and see that no delay may take place in the work being done for military service or the shipbuilding program of the United States. If any delay should take place, it may then be necessary to place another embargo on lumber so as to take over some of that lumber for the needs of some of the branches of the service mentioned above."

The Canadian Commission of Conservation has recently made an investigation into forest fire losses in British Columbia and reports that twenty-two times as much timber has been destroyed by fire in British Columbia as has been cut by the lumbermen. On 95,000 square miles the timber has been uselessly destroyed, most of the loss having taken place many years ago.

EDGINGS

Ontario

The Abitibi Timber Company, Limited, under the provisions of the Ontario Companies Act, have changed their name to the Beaver Abitibi Timber Company, Limited.

The planing mill of the Parry Sound Lumber Company, Parry Sound, Ont., which was recently destroyed by fire, will not be rebuilt this year. It is probable that it will be rebuilt next spring.

Operations upon the construction of the plant of the Port Arthur Pulp and Paper Company are progressing rapidly, and it is expected that it will be ready for operation in about six weeks. The company now have about 2,500 cords of wood on hand and have contracted for 70,000 cords.

The Union Box and Shook Mills Limited has been incorporated with head office at Pembroke, Ont., and capital stock of $150,000, to carry on business as manufacturers of and dealers in lumber, boxes, shooks, etc. Among those interested are J. H. Reeves, J. R. Lockhart, and W. F. Behan.

The Canadian Gambite Company, Limited, has been incorporated, with head office at Hawkesbury, Ont., and capital stock of $100,000, to carry on business as manufacturers of and dealers in the products of the forest, pulp, paper and all products or by-products of wood and pulp. The provisional directors are J. S. Lovell, W. Bain, R. Gowans, J. J. Dashwood, C. D. Magee, E. H. Stewart and J. Henry.

The head office of the Wilson Lumber Company, Limited, of Toronto, Ont., manufacturers of hardwoods and yellow pine, henceforth will be located at Jackson, Miss. Mr. P. Bass, general manager, will have his new headquarters at Jackson, where the band mills of the company, operated under the name of the Mississippi Hardwood Company, are located. The yard at Toronto will be continued, but the general sales and buying departments will be at Jackson.

Among the men interested in the Mingo Pulp, Paper and Land Company Ltd., Toronto, which was recently incorporated with capital stock of $1,000,000, are Clarence R. Pope, of New York City, and W. A. Brodie, of Toronto. The company own 20,000 acres of well-wooded and mineral lands northeast of Chapleau, Ont., and intend to take out 50,000 cords of pulpwood during the coming winter. The tract is well watered and is reached by two transcontinental railway lines. It is also rich in iron pyrites, which show a percentage of 46.94 sulphur extraction. It is said that the owners intend erecting a large pulp mill on the property in the near future.

The Eagle Lake Lumber Company, Limited, South River, Ont., which has recently been incorporated with Ontario charter, and authorized capital of $40,000, has taken over the manufacturing interests, timber, two sawmills, etc., of the C. G. Anderson Lumber Company at South River. The company is composed of Messrs. W. C. Shreiner, president; S. R. Anderson, vice-president; and H. Mawson, secretary-treasurer. The company will operate both sawmills, each of which has a capacity of about 15,000 feet per day. They will manufacture principally hemlock and birch and their head office will be at South River. The company intend to put two camps into the woods this winter and will take out about 2,000,000 feet of birch and hemlock and a small percentage of spruce. About one and a half million of this will be hemlock. The company have between 3,000 and 4,000 acres of timber.

Eastern Canada

Julien Therrien, wholesale and retail lumber dealer, Montreal, P.Q., has been registered.

The Canadian Pulpwood Products Association, Montreal, P.Q., has been registered. F. Laberge is interested.

Boudrias and Soucy, lumbermen, Montreal, P.Q., have been registered. C. Boudries and N. Soucy are interested.

The Parker Pulpwood & Timber Company have opened offices at 303 McGill Building, Montreal. They specialize in pulpwood. Mr. T. G. McLaurin is the manager.

Price Brothers, Quebec, P.Q., have under consideration the building of a new slash mill at Shipshaw, together with a chute across the Saguenay River, for conveying the wood from Shipshaw to their ground wood mill at Kenogami.

The greater part of the lumber piled in the sheds of Mr. Wilfrid H. Pauze, Cote des Neiges, Montreal, was recently destroyed by fire. Mr. Pauze specialized in B. C. lumber, mouldings, sheeting, flooring, etc., and kept a large stock on hand, mostly stored in one very extensive shed.

La Compagnie Jalbert, Ltd., has been incorporated to carry on a general lumber business; to acquire lumber limits and to operate saw, pulp, rossing, and paper mills; to manufacture and deal in lumber, pulp, and paper pro-

ducts; to acquire water powers; and to carry on a contracting business. Messrs. H. Jalbert, merchant; Thomas Jalbert, contractor; S. Simard, lumber culler, all of Chicoutimi, P.Q., are interested. The capital is $50,000, and the principal place of business Chicoutimi.

Western Canada

The North Canada Lumber Company have opened a branch at Star City, Sask.

The Lake Lumber Company, The Pas, Man., have sold their business to the Finger Lumber Company.

E. M. Joyal, of The Pas, Man., has been awarded a contract to cut 4,000,000,000 feet of timber for Mackenzie and Mann. He will establish winter camps in the vicinity of Chemong, between The Pas and Hudson's Bay Junction.

The Aeroplane Spruce Lumber Company, Limited, has been incorporated, with head office at Vancouver, B. C., and capital stock of $25,000, to carry on business as timber merchants, sawmill, shingle mill, and pulp mill proprietors, loggers and lumbermen.

The Premier Lumber Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $10,000, to carry on business as manufacturers of and dealers in lumber and shingles, shingle mill and sawmill owners, loggers and lumber and shingle merchants.

Quebec Will Extend Its Forest Nursery

During the past year more than 500,000 forest tree seedlings have been shipped from the Quebec forest nursery at Berthierville, P. Q. The provincial forester, G. C. Piche, reports that of these, nearly 200,000 were white pine, 180,000 Norway spruce, 82,000 Scotch pine, 20,000 Douglas fir, 8,000 red pine, 7,000 white spruce, and 6,000 tamarack, the balance being made up of relatively small numbers of other species, mostly hardwoods, to supply the demands of farmers. The great bulk of the demand was, however, for the reforestation of burned-over non-agricultural lands. The Laurentide Company, and the Riordan Pulp and Paper Company were heavy purchasers of plant material from the provincial nursery, in addition to supplies secured from their own nurseries. The Perthuis seigniory also has purchased a large number of small trees from Berthierville annually during the past seven years. To date, the provincial nursery has shipped a total of more than 1,500,000 trees since its inception; of these, more than half have been supplied during the past two years. The demand for planting stock has become so insistent that the provincial forester announces the proposed extension of the capacity of the Berthierville nursery to 3,000,000 seedlings annually. Of these, the majority will be Norway spruce, which is believed to be the most suitable species for pulpwood production.

Speeding Up Southern Pine Output

In connection with the campaign for speeding up the shipbuilding program, President Chas. S. Keith, of the Southern Pine Manufacturers' Association, has sent out the following letter to 1,000 manufacturers of southern pine: "We are engaged in war. Our first duty is to our country and its allies. Material, supplies and food are essential to final victory. Without shipping facilities our cause is lost. It is up to us to see that the wooden shipbuilding program is not delayed, but expedited. Our greatest need is ships, ships and more ships. We must build faster than Germany can sink. Any manufacturer who does not do his part, by going in advance of this logging for the necessary timber and who will not refuse to take orders for material which interfere with government orders is a slacker and a traitor, and is encouraging and assisting our enemies. Under such conditions, the government would be justified in the seizure and operation of his plant in the nation's interest, and the association will encourage and assist the government in such action. No loyal American will thwart such a program, but will aid. We are appealing to you for the best that is in you and the industry."

Encouraging Use of Canadian Timbers in England

A cable from London, England, states that the Executive Council of the Imperial Institute has appointed an advisory comimttee for Canada, consisting of Sir Geo. Perley, Canadian High Commissioner, Sir Robert Kendersley, Governor of the Hudsons Bay Company, J. G. Colmer, former secretary of the High Commissioner's office, J. H. Plummer, of the Dominion Steel Corporation, and Sir Keith Price, of the Ministry of Munitions. One of the most important matters on which action is being taken by the committee is that of the more extensive utilization of Canadian timbers in the United Kingdom. The Imperial Institute Advisory Committee on Timbers, has been taking evidence on this subject. Arrangegments have been made for a series of practical trials of selected British Columbia timbers to be carried out by H. M. Office of Works, with a view to the inclusion of these timbers in official specifications.

Australian Timber Trade Shows Decrease

Mr. D. H. Ross, Canadian Trade Commissioner at Melbourne, Australia, in a report dated September 26th, says:—

Victoria is the only state in which annual statistical returns of timber are compiled. While the figures given are only applicable to one state, they are indicative of the decrease in the importation, consumption and stocks held in all the Australian states. The Victorian returns show a consumption of 61,217,000 superficial feet, compared with 93,177,000 feet for the preceding year, a decrease of 34 per cent.

With the exception of New Zealand kauri pine, decreases in consumption are shown in all imported lines of timber.

Particulars of imports and consumption for the year ended on June 30, 1917, stocks held on that date, together with comparative figures for the previous year, are as follows:—

Imports	1915-16 Ft. super.	1916-17 Ft. super
Red deals	2,320,000	.....
Dressed flooring, lining and weatherboards.	10,235,000	1,671,000
Spruce and hemlock	711,000	668,000
Oregon	22,378,000	12,256,000
Sugar and yellow pine	1,389,000	704,000
Redwood	11,773,000	2,909,000
American shelving	33,000	19,000
New Zealand kauri	4,255,000	3,883,000
White pine and rimu	23,697,000	15,798,000
Clear pine	61,000	18,000
Pacific pine	2,034,000	.....
Total	87,886,000	37,926,000
Consumption		
Red deals	1,397,000	921,000
Dressed flooring, lining and weatherboards.	24,460,000	12,545,000
Spruce and hemlock	2,711,000	1,069,000
Oregon	25,416,000	15,064,000
Sugar and yellow pine	1,896,000	1,112,000
Redwood	8,967,000	6,584,000
American shelving	48,000	27,000
New Zealand kauri	3,983,000	4,902,000
White pine and rimu	22,156,000	18,728,000
Clear pine	59,000	20,000
Pacific pine	2,084,000	245,000
Total	93,177,000	61,217,000

Stocks	June 30 1916	1917
Red deals	2,786,000	1,865,000
Dressed flooring, lining and weatherboards.	18,350,000	7,476,000
Spruce and hemlock	996,000	595,000
Oregon	6,650,000	3,842,000
Sugar and yellow pine	2,308,000	1,900,000
Redwood	7,226,000	3,551,000
American shelving	47,000	39,000
New Zealand kauri	5,521,000	4,502,000
White pine and rimu	11,044,000	8,114,000
Clear pine	48,000	46,000
Pacific pine	245,000	.....
Total	55,221,000	31,930,000

Importations of American laths and pickets were 4,499,000 pieces and 441,000 pieces respectively for 1916-17, as against 11,630,000 pieces and 752,000 pieces for 1915-16.

French Hospitals Want Wooden Legs

Among the passengers who arrived a short time ago at an Atlantic port from Spain, on a Spanish liner, was Frederick Voss, a representative of the Association for Trade with America of the department for the manufacture of artificial limbs at Geneva, Switzerland. He said that the hospitals in France are full of maimed soldiers needing wooden legs, and the government was unable to cope with the demand. "The material for making these artificial limbs," Mr. Voss continued, "can be obtained only in the United States, and I have come over to make arrangements for its exportation to Switzerland. The Swiss Government has established a factory at Brienz, with facilities for turning out from 1,500 to 2,000 wooden legs a week. Just before leaving France I met General Maurier, who said that the hospitals are sadly in need of artificial limbs so that they could send maimed soldiers back to their homes and take other injured men into the hospitals in their places."

Lumber firms in Montreal and the province of Quebec have taken a prominent part in promoting and subscribing for the Victory Loan. Besides taking large amounts, many have agreed to carry loans for their employees and also to contribute a portion of the money. Outside of Montreal, the large lumber and pulp companies have materially contributed to the success of the loan. The names include River Ouelle Pulp & Lumber Company, Price Bros., Dobell, Beckett & Co., Louise Lumber Company, Quebec; Williamson & Crombie, Richmond; E. T. Lumber Company, Sherbrooke; John Breakey, Levis.

The Coupling That Holds Like Grim Death

The grip of a dying man is unbreakable—so is the grip of Spiro. Once in place it can be forgotten. It will never work loose—it is safe and dependable. The coupling you read about but never have seen.

Look at its simple but rugged construction. The pull of the bolts on the two halves of the coupling act on the Spiro Sleeve, so that it grips the full surface of the shaft with a grip that holds like grim death.

The Bond Book tells the complete story—get it to-day.

Lumber Dealer's Experience

The very best evidence we can offer of what a "Little Giant" Motor Truck will do for you is in the experience of lumber dealers and lumbermen who are now using them. Here's one taken at random: "We use a Little Giant one-ton truck, which has been giving us exceptionally good service. While its guaranteed capacity is only one ton, it is very strongly built, and we carry nearer two tons than one a good share of the time, although we do not aim to use it for heavy hauling."—Foster Lumber and Coal Company, Valparaiso, Indiana. This is an extract from their letter, but it is sufficient to give you their satisfied viewpoint.

The "Little Giant" Motor Truck

is standardized. Every essential part of machinery is good from start to finish. We can show you a saving in money over horse-drawn trucking that will be almost unbelievable without the actual proof. Little Giant Trucks are so tool-proof your men can take hold immediately and get real service from them. Write for literature and information.

USE LOGGING MACHINERY

IN PLACE OF MEN

After the tree is cut down, then comes the expensive process of getting the logs to the mill.
Much of this expense can be saved, and at the same time the work done easier and quicker by the use of Marsh & Henthorn

Hauling or Skidding Engines and Loading Engines

We make the right size and style Engine for your camp, whether your output is large or small

Our booklet "Suggestions to Lumbermen," describes many expense saving methods of handling logs with inexpensive outfits. If you have not received your copy yet, drop us a card
Our experts are at your service also. Let us help you to save money in getting out your season's cut

MARSH & HENTHORN, Limited, BELLEVILLE, Ont.

GOODHUE BELTING

FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts," then you will buy a "Goodhue."

According to the conditions under which the belt has to run, we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality, but each made for a different service

Send for particulars and prices **J. L. GOODHUE & CO., LIMITED, Danville, Quebec**

THE MOST OF THE BEST FOR THE LEAST

DON'T STINT "THE BOYS" BUT BUY THEIR FOOD CLOSELY

MINCE MEAT
JAMS and JELLIES
BUTTER
EGGS
EGG PRODUCTS
CHEESE
RAISINS
CURRANTS

BESIDES being manufacturers ourselves, we buy from the leading markets of the World and can consequently offer you a range that, in quality and price, few houses in Canada can equal.

While you, of course, cannot afford to stint your men, you have got to watch your costs. You have to buy from that house which can give you the greatest possible value for the least money expended.

In this regard we can be of mighty valuable assistance to you. Write us.

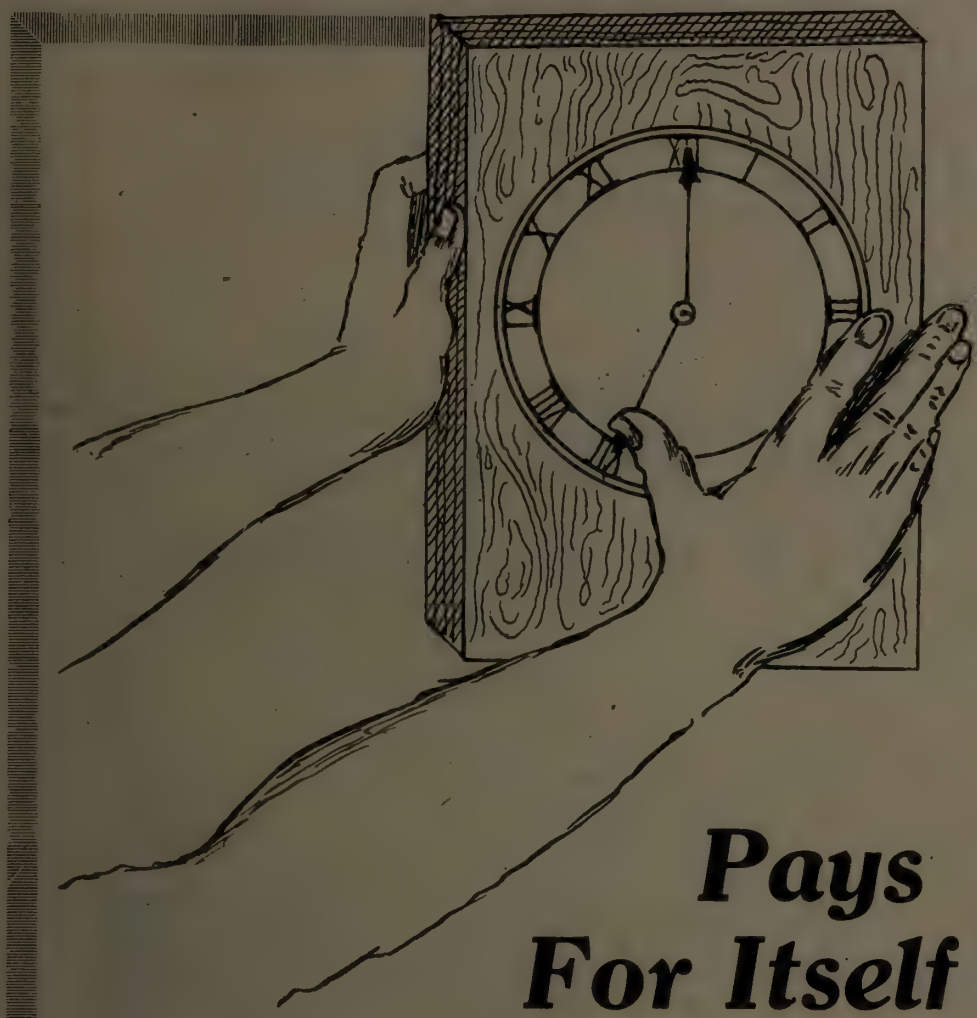
You Can't Stop Time—



But You Can Stop Paying for What You Don't Get

THE INTERNATIONAL TIME RECORDER

Pays For Itself

It keeps an accurate record of the time you are paying for—in fact, your employees print their time themselves; and THEY GET TO WORK ON TIME.

Therefore the International avoids wage disputes—it makes for greater contentment—it is a sure impetus to production—it will save you much time in making up your pay rolls and—YOU only pay for what you GET.

There is absolutely no doubt that the International will pay for itself. Put it to the test. There is one particularly suited to your needs.

Prices from $135.00 up.

Shipment by car, canal boat or cargo.

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

The Only Loose Pulley

L. A. DeLaplante Limited

LUMBER

DOORS SASH AND INTERIOR TRIM

PRIVATE PHONE EXCHANGE MAIN ST.

East Toronto, June 10/10

Chapman Double
Ball Bearing P/U

Dear Sirs

In regard to double ball bearings supplied by you, we find those on line shaft giving entire satisfaction and find them quite a saving on power, as for the ball bearing loose pulley, they are decidedly the finest, and only satisfactory loose pulley we have ever had, no noise or heating and consequently no loss of time, which so frequently occurs with the ordinary loose pulley, we have run the loose pulley on our big snatcher for nearly two years and consider it a severe test and it runs as nice to day as the first day we used it can recommend your bearings and pulleys to any one in the manufacturing business especially planing mill work which we have proved.

Yours very truly
L. A. DeLaplante Limited
per W. Graham Supt.

Chapman Double Ball Bearings

have been installed in over 3000 factories of all classes during the past fifteen years, and the above letter is one of many of a similar import, bearing testimony to the efficiency, long life, and cleanliness of the bearing. Some of these have been compiled in a booklet, "Results", which we will be pleased to send on request.

Buy

FIRE BRICK

On a Quality Basis

Use as much care in its selection as you would in choosing the lumber that goes into your products.

No brick gives the best results for every purpose. The brick you would use for your refuse burner may not give you the best results for your Dutch Oven.

We Manufacture the Following Well Known Brands

"Elkco Special," "Elk Steel," "St. Marys," "Keystone" and "Rotex"

When sending us your inquiries, specify for what purpose you need the brick.

We Make a Specialty of
REFUSE BURNERS, BOILER SETTINGS, KILNS, DUTCH OVENS, ETC.

Catalog sent upon request.

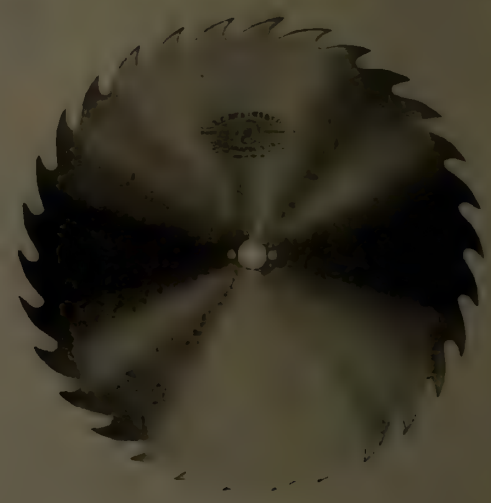
ATKINS

ALWAYS AHEAD!

The most advanced improvements in Saw manufacture have placed us far ahead in the manufacture of Saws for all uses.

Our Band and Circular Saws are worthy examples. They cut more timber—do it with less power and require less repair to be kept in perfect condition.



Economy in mill operation has proved their value. Put them through competitive tests with other Saws.

The Sterling quality of

Atkins Sterling Steel Saws

will overcome your difficulties.

Grooves Cut with Huther Bros. Dado Heads

Fits Any Saw Mandrel

A Huther Bros. Dado Head consists of two outside cutters and enough inside cutters to make the required cut. This Head will cut perfect grooves, with or across grain, any width. It is an easy Head to keep in perfect condition, has a simple quick adjustment, and may be enlarged any time after purchase. Sent on approval and if not satisfactory return at our expense.

ROCHESTER, N. Y.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

CLIMAX Improved Geared LOCOMOTIVES FOR WOOD AND IRON RAILS

A 62-ton Climax Locomotive Designed Especially for Heavy Logging Work.

Climax Locomotives are successfully operated on steep grades and sharp curves. Any weight or gauge. Locomotives in stock for immediate shipment. Get Catalog "H."

MANUFACTURING WOODWORKING

Machine Knives, Circular Cutters and Mortise Chisel

This illustrates our **No. 5 PORTABLE SAW MILL,** just the thing to work up a small pocket of timber or for an out-of-the-way location.

IMMEDIATE DELIVERY

We have in stock a Right Hand Saw Frame and Carriage, also a set of track timbers, as shown in the above cut (except that they are the opposite hand). Other items in stock at Orillia include :---

No 1. Log Jack with foot wheel and idlers.
No 7. Log Jack " " "
10" x 36 ft. Steam Feed.
10" x 42 ft. Steam Feed—Either feed can be furnished with vertical or horizontal valves.
Double acting set works in No. 1, 2, and 3 sizes.

We also have a second-hand plain slide valve engine, right hand, side crank, 9x13, suitable for a small saw mill plant. This is a good bargain and can be shipped immediately.

Sawmill Machinery

The Waterous Twin Circular Saw

in conjunction with the Kendall Circular Gang presents the cheapest way of turning small logs into merchantable lumber.

Points every man interested in this great industry should note and remember.

THE TWIN CIRCULAR consists of two independently driven saw frames, carried on planed iron slides upon which they are adjustable, to permit cutting a cant as narrow as 4 inches or to a width of 12 inches.

FRAME CASTING is in one piece with the bearing cast solid with the frame to make mandrel alignment a certainty. The saw frames are adjustable by rack and pinion and controlled by a hand wheel which gives rapidity of movement with a minimum of effort and no possibility of a shift during cutting.

SAWS are 42″ in diameter and run at 700 R.P.M.

MANDRELS measure 3,7/16 inches diameter and carry a 20″ x 13″ pulley.

BRANTFORD, ONTARIO, CANADA

$5,000,000.00
worth of mixed metal sold annually.

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, **65c per lb.**; West of Fort William, **70c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

HOYT METAL CO., Toronto, Canada

Have factory and office at Eastern Avenue and Lewis Street, Toronto, Canada

Factories also at:— New York, N. Y. London, Eng. St. Louis, Mo.

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

We are not Playing Checkers

Every man-jack of us at the Carborundum plant is working like the proverbial beaver, for never before has there been such a demand for Carborundum and Aloxite Products.
We are doing our level best to meet this big demand—enlarging our plants, increasing our forces, speeding up production—we are even building a big 20,000 horse power furnace plant in Canada in our efforts to keep up with things. We have a definite service to perform for we are helping to produce the necessities of war.

Carborundum and Aloxite Products are Doing Their Bit

They are grinding shrapnel shells, high-explosive shells, rifle barrels and parts—grinding bayonets and sabers. They are grinding a hundred and one different parts of the aeroplane and the auto truck, the machine gun and the field gun. They are shaping armor plate and grinding car wheels; grinding plowshares, and the tools of the metal-working trades of the world. They are grinding torpedo tubes and torpedoes, grinding submarine engine bases; beveling the lenses of periscopes and buffing the soles of the army shoes and grinding the shears for the pocket kits of the "Sammies." They are doing a thousand and one war tasks quicker and better than they have ever been done before.

Carborundum and Aloxite products are surely doing their bit, but with it all we haven't neglected for one instant our regular patrons—we are doing all in our power to keep up with the pace; to keep up to the standards of Carborundum service.

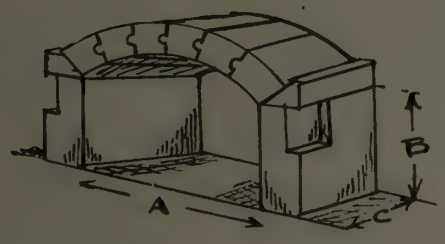
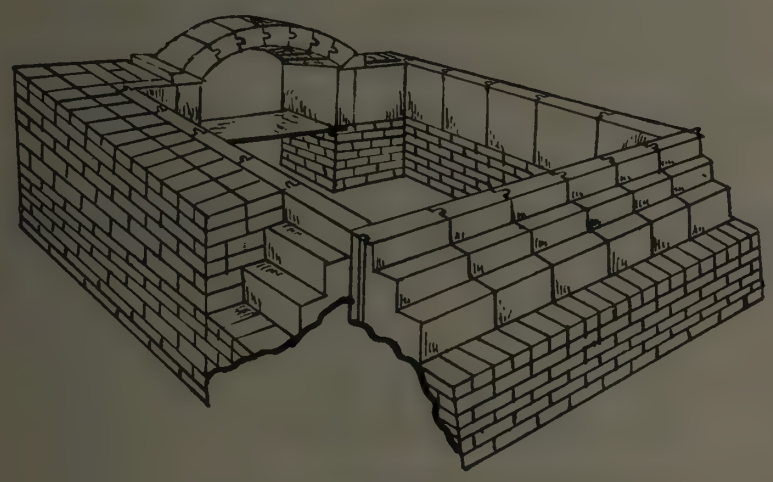
JOHN W. GATES

Contractor

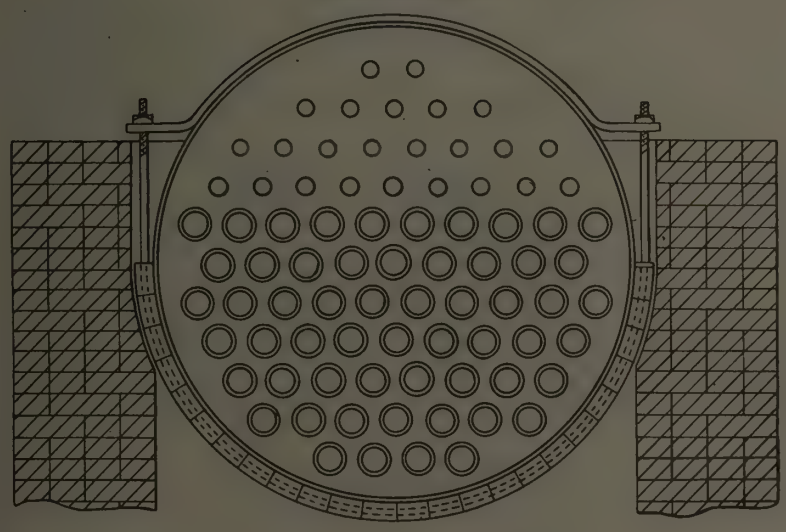
Making a specialty of Boiler Setting, Furnace Building and all kinds of Power Plant Brick Work.

Using only the Best of Material and Mechanics that are Specialists in this class of work.





Patented 1916 and 1917



Patent applied for.

Gates Boiler Door Arches and Jambs

Gates Interlocking Stoker and Dutch Oven Arches

If you have had trouble with your arches and jambs try mine—the kind that last.

Gates Patent Furnace Linings

are the simplest and most durable linings made. Their use materially reduces the number of joints in the furnace walls, clinkers do not readily form on their smooth surfaces, the tongued and grooved joints prevent air leaks, thus the linings not only last longer but tend to promote better combustion. The material used is very hard and refractory; the softening point is 1,700 deg. Centigrade. These qualities are essential to a good boiler setting. Should any of these Furnace Side Wall Blocks fuse out they can be replaced without disturbing the adjoining brickwork, by any handy man.

Have you fire cracks in the circumferential seam of your boiler?

How often have you had the boilermaker caulk them only to have them crack open again and leak?

Why not put on one of my G. & J. SEAM PROTECTORS which will do away with all your trouble.

It is easily adjusted to any boiler without any cutting or tampering with an already weak joint.

An important feature of this protector is that you can replace any block from the outside of the boiler setting, without shutting down your boiler.

We can supply you with this protector from stock.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 37 **Toronto, December 15, 1917** **No. 24**

The Organization Movement in the Lumber Trade

Organization arrangements in connection with both the retail and the wholesale lumber trade of Ontario have made much headway during the past month or two. In previous years it has been a difficult matter to interest Ontario lumbermen in any plans for forming an organization to promote their mutual interests, but examples of successful organization elsewhere and conditions which have arisen on account of the war have brought home to lumbermen the wisdom of co-operative effort in dealing with those trade problems that are too large for individual handling, or in connection with which results are only possible when backed up by the force of numbers. There never was a time when the advantages of organization were more clearly apparent than they are to-day, and, probably for this reason, it has been an easier matter of late to interest lumbermen in proposals of this nature. Moreover, the ground-work of association effort has been well done elsewhere, and those who are working out the plans for the retailers' and the wholesalers' organizations have definite schemes to work upon. Conditions, therefore, are favorable for the organizations which are now under discussion, and which will probably have been definitely put into operation within the next month. The plans have been worked out, and many members of the trade are enthusiastically advocating the movements. It remains only to complete the organizations and to enlist the support of a sufficient number of hard workers to ensure good progress after organization has been completed. It even looks as though those who have already been working are of sufficient influence to ensure success.

The plan which is being worked out by the retailers of Ontario is to form five local associations, covering well-defined groups, whose interests and trade conditions are mutual, and that each of these local associations shall be represented in a general or central association, with headquarters probably at Toronto, which will look after matters of general interest to all retailers in the province. Roughly, this plan is the same as that which has been worked out successfully in the United States, and is the basis of our own governmental system in Canada. An organization based on these ideas puts upon everybody concerned a share of the work and responsibility and maintains interest continually so as to avoid the old difficulty in connection with many of the earlier-formed associations, namely, that everyone left the work to a central committee and the proceedings dwindled down to the holding of an annual meeting. The secret of association success is in maintaining interest all the time. There are so many ways in which this can be done for a retail association that the outlook is quite promising. A simple outline of the matters to be attended to will indicate this. Such matters must be handled as transportation credits, cost accountiing, advertising, insurance, better acquaintance with competitors, plan book service, training course service, etc., all of which have been handled successfully elsewhere and will no doubt be taken up by the Ontario association as soon as possible. The organization meeting of the Ontario retailers will be held in the afternoon of Friday, December 21, at Toronto. A notice regarding it appears elsewhere in this issue.

The wholesale lumber dealers of Toronto have made good progress also in connection with their organization plans, and have enlisted sufficient interest among the wholesale trade, both in Toronto and in other parts of the country to warrant them in organizing an association without delay. Their organization meeting will also be held at Toronto on Friday, December 21, after a dinner at the Albany Club, in the evening. The plan which is under consideration is to form an association quite similar to the National Wholesale Lumber Dealers' Association of the United States. A constitution and by-laws have been prepared, which will be submitted at the meeting on December 21. The scope of the association proposed will include the creation of a bureau of information for securing credit reports, handling transportation matters, legislation, inspection, arbitration, etc. The first meeting held in Toronto was very fully attended, and it is probable that the next meeting will see the association definitely formed and ready for operation.

Unquestionably these two associations, if they are supported as they deserve, will be of great assistance to the trade. The support already assured, moreover, indicates that there is little doubt about their future.

Ontario's Unsatisfactory Mechanics' Lien Act

The Mechanics' Lien Act of Ontario is far from an ideal piece of legislation from the point of view of the individual or firm which supplies material or labor for the erection of a building. From a contractor's or from an owner's point of view it is good enough, but a study of the act, in comparison with the lien laws in force in some of the states of the United States of America, readily reveals the inherent injustices of the Ontario Act, and shows how the latter could be improved. It would be difficult to conceive of an act planned more definitely than the Ontario act to favor the speculative builder, the careless or dishonest contractor, of the selfish or dishonest owner who desires to have a building erected at the least possible cost, irrespective of the losses which may be involved upon those who supply the material and the labor. The Ontario act is a striking example of much that is bad in this connection, while the act now in force in the State of Ohio, which is being copied in several of the other states, is an equally striking example of an act drawn up with a view to affording justice to all parties concerned and giving everybody a fair opportunity to make a living out of his labor or investment.

Briefly, the Ontario act provides that the owner shall pay to the contractor, as the building progresses, 80 per cent. of the amount certified to by the architect as having been earned, and that he shall retain 20 per cent. of this amount and of the amount of the "extras," in order to satisfy the claims for material and labor which may remain unpaid. If the owner complies with this requirement he is relieved of all liability, and, therefore, from his point of view, the act is an exceptionally satisfactory one. The contractor, on account of the fact that he is entitled to receive 80 per cent. of the amount earned and that the

remainder is assured to the material man and the workman, also looks with favor upon the act, as it involves him in no particular danger, so long as he conducts his business carefully, while it puts into his hands, if he happens to be dishonest, a large sum of money with which to juggle his payments or even to dispose of them in other ways, if he can put off the material man or the workman with notes or promises. The act actually encourages the contractor in ways that are unbusiness-like and dishonest, instead of providing for the protection of those who furnish the material and do the work. When a contractor has accepted a job at too low a price and the situation develops in which the lien law is supposed to afford protection to the material man and the laborer, the Ontario law makes it possible for the contractor in many cases to get away without loss and to leave the material man and the workman to bear the burden.

It is a great undertaking to bring about any changes in the existing Mechanics' Lien Act. It has come to be looked upon as of a semi-sacred character, not to be disturbed if there is any way to avoid it; but the situation in Ontario seems to demand a change, both in the interests of justice and for the protection of many important lines of industry and trade. The Ohio law, while it may still be open to improvement, affords an excellent example for the revision of the Ontario law. The principle of the Ohio law is entirely different from that of Ontario. It seeks to place the responsibility where it properly belongs and to give protection to the parties who should have it. The Ohio law provides that when a payment becomes due to a contractor the owner shall require an affidavit from him showing all the names of unpaid laborers and the amounts due to them, and all the names of material men and the amounts due to them, accompanied by certificates. Similar affidavits are required in connection with sub-contracts. When he has received these affidavits the owner must pay what is due, making the payments to the sub-contractors, material men, and laborers direct, not to the chief contractor. Then the balance of the amount due can be paid to the chief contractor, unless notices have been filed with the owner showing amounts due, which do not agree with the amounts shown in the affidavit.

This law applies to private contracts only. Its theory is that the owner holds the contract price in trust for those who have enhanced the value of his property by their labor and material. To guarantee the performance of that trust a lien is created on his property, and to enable him to perform his obligations he is required to demand, before paying his head contractor, an affidavit showing who performed labor and is unpaid, and who furnished material and the amount due, if any. The owner makes payment direct to those entitled, or withholds the money until all adjustments are made. The affidavit, whether true or false, is the owner's absolute protection, but material men and laborers can, at their option, serve notices on the owner which prevent loss through fraud.

To make the law more uniform in practice and to simplify its operation a form of affidavit is written into the statutes. The Ohio law does not, nor should any law, remove the duty of exercising care in the extension of credit. It does not seek an absolute certainty of payment, but it has proved to be satisfactory to everybody, and has removed from the building business a great deal of its speculative and uncertain commercial character. The Ontario law has almost none of these advantages. It is satisfactory to practically no one but the careless or dishonest contractor. It does not remove any of the uncertainties of the building business, but encourages speculative building and unsafe estimating by contractors, while it leaves the material man and the laborer at the mercy of any one who is able to secure credit, if he wishes to take advantage of the opportunities which the law affords him of taking great risks at somebody else's expense. It would be a wise move on the part of the material man to endeavor to enlist the assistance of all who are concerned in having the Ontario lien law amended so as to embody features similar to those of the Ohio law.

Forestry Service Appointments to be Freed from Politics

A recent announcement from Ottawa stated that the Dominion Government had definitely pledged itself to place the entire outside service of the Civil Service in charge of the Civil Service Commissioners at Ottawa. To the average citizen who is not in touch with the working of the Civil Service this statement may not carry much meaning, but to those who know something of what in involves it is recognized as a radical change in the method of making appointments to the Civil Service, a change which must produce important and beneficial results. There can only be one interpretation of such a pledge, namely, that the government intends to do away entirely with the bane of political interference with appointments to the outside Civil Service. Anyone who has not concerned himself closely with politics may wonder that political influence should be permitted to affect appointments to the extent of injuring the usefulness of the service, but the fact remains that the best friends of the government, as well as its strongest critics —irrespective of what party may be in power—have always admitted that the efficiency of the service was far below what it should be, on account of the patronage system of appointment, which has been taken for granted as a necessary factor in the management of the service, and which has made it possible, and of frequent occurrence, that an applicant with political influence could get a position without regard to the fact that better men who have no political influence are available. The result has been the impairment of the service in many of its most vital respects.

Probably in no other branch of the outside service has this been more the case than in connection with the Forest Branch of the Department of the Interior, and it is encouraging to learn that merit is to be the basis of appointment in future, and that the task of making the change in the system of appointment has already been taken in hand. It is to be hoped that it will be pushed through to completion in the very near future. Political interference has played havoc with the technical services, such as the Dominion Forest Branch in the past, and the readers of the Canada Lumberman, representing the lumbermen of Canada, who are so intimately affected by the efficiency or inefficiency of this service, will be glad to know that in future it will be composed of men who are specially fitted for their work.

The Dominion Forest Branch administers the forests of the three prairie provinces and a forty-mile strip bordering the railways in British Columbia. The head office staff of the branch is subject to the rules of the Civil Service Commission. The outside service of the branch, however, has always been to a serious extent the plaything of local politics. It has been a frequent custom to appoint fire rangers upon the recommendation of the patronage committees, and there have been instances where positions calling for technical training have been filled by political nominees absurdly unfitted for the duties of the post. This means that whatever party has been in power at Ottawa, the responsible officers of the Dominion Forest Branch have not been selecting their own ranger staffs in the main, nor has it been possible to bring the employees under a discipline that assures efficiency of service and economy of money. Even in times of peace there was no excuse for this. It was simply one of those evils of our government system which the public imagined could not be remedied, and which successive governments preferred to leave alone.

The pledge which the Dominion Government has given upon this subject ought to be translated into action at once and the old system never allowed to return. An order-in-Council is all that is needed in the way of legislative effort to make the pledge effective. While the situation does not affect the Eastern provinces definitely, the Western provinces will gain immensely through a stronger and more alert forest service which can reduce the fire losses and render the general management of our forests more efficient and conomical. The importance of having capable men appointed to the Forest Ranger Service has been amply demonstrated by some of the provinces of Canada and by several of the states of the Union. It will mean much to the lumber industry of Canada and to the Forest Service if this reform is put through immediately and the Dominion takes its place among those who are promoting the efficient management of the country's forest resources.

Treason Demands Ruthless Suppression

Handling the alien enemy population of Canada has been a difficult problem for the government ever since the commencement of the war. Every now and then some new outbreak of enemy viciousness shows the danger of temporizing with this class of criminals and traitors. The occurrences at Kitchener, Ont., and in Quebec Province are fresh in our minds at present, and are evidences of disloyalty that should be handled without gloves. It is not to be wondered at that the loyal citizens of Kitchener indignantly demanded, and finally secured, an apology to Sir Robert Borden for the treasonable conduct exhibited by some of the people of Kitchener who made it impossible for him to address a public meeting there. Nor is it any wonder that the loyal citizens of other parts of the County of Waterloo commenced a movement for separating from that portion of the county in which Kitchener is situated, and having the county seat of government located in Galt or elsewhere. This would be the only natural outcome of persistence in disloyalty.

Without seeking to compare Canada unfavorably with the United States in matters of this sort, it is worth while looking at the way in which the United States Government is dealing with the efforts of the I. W. W. and other friends of the Kaiser in the United States to cripple the airplane and shipbuilding timber production on the Pacific Coast. A conference was held recently at Seattle, Wash., at which Secretary W. D. Wilson of the Department of Labor, Col. B. P. Disque and Capt. R. Hawkins of the United States Army Signal Corps met nearly 150 lumbermen of Western Washington. The object of the conference was to speed up production of spruce and fir for airplane and other war uses.

Ever since the strike of mill workers and loggers, which began last July 16, and the months of close down, the intimidation and sabotage that followed have made it impossible to speed up the spruce production to fill the government's needs, and whereas 5,000,000 feet a month has been the maximum furnished the government and its allies instead of 10,000,000 feet a month, as required, the total output must be increased to 15,000,000 feet a month for some time to make up for the shortage in supply to date. While the manufacturing of lumber on the north coast has been brought up to 85 per cent. of normal, the shortage has been confined to the districts producing spruce lumber, particularly for government purposes, as well as to some sections where fir airplane material and shipbuilding lumber are being gotten out, indicating that the slowing up of production by a certain class of labor is due to the sinister hand of an alien enemy, and it has been admitted that the millmen and loggers have been powerless to cope with this influence without assistance from the government.

Colonel Disque announced at the conference that by December 15 he would have 8,000 to 10,000 soldiers in the logging camps getting out spruce lumber, these soldiers being practical loggers partly from Washington and Oregon and partly from the timbered regions of Minnesota, Wisconsin, and Michigan. They will supplement the crews of men already at work logging spruce, and will speed up production to the point required by the government. This was the first definite announcement made by Colonel Disque of his plans for assigning troops to the forests, and it had a cheering effect on the loggers and millmen present who have been working against countless difficulties in an endeavor to make good their promises and carry out their patriotic desires to aid the government in every possible way, and particularly by furnishing the needed spruce airplane lumber.

This is the only way to deal with men of such character. They must be handled ruthlessly, and as the ideal they worship is that of force, they should be shown that force will be used unsparingly in preventing their sinister methods from bearing fruit.

Editorial Short Lengths

Dr. C. D. Howe, of the Faculty of Forestry, University of Toronto, has been engaged in making a study, on behalf of the Commission of Conservation, of the reproduction and growth of pulpwood species after logging in the St. Maurice Valley, Quebec. The investigation has not yet been completed, but a preliminary report was made by Dr. Howe, before the annual meeting of the commission at Ottawa on November 27. Some rather startling facts were disclosed regarding the reproduction of pulpwood species on cut-over lands. Valuable co-operation in the investigation was furnished by the Laurentide Company and the Quebec Forest Service. Sufficient information has already been furnished to show the radical misconception of the facts prevalent amongst those who think and assert that the pulp forests reproduce themselves by annual growth within short periods of time. As a matter of fact, the actual growth in the forest is very, very small. The larger coniferous trees are cut out. The hardwoods remain. The hardwoods, with their heavy crown cover, shade the young spruce and balsam trees to such an extent that their growth is almost incredibly slow. The successful cuttings which lumbermen tell of over the same territory, when analyzed, tell a story that is the reverse of satisfactory. It shows that, instead of the forest being reproduced, the successive cuttings have been eked out by cutting smaller trees and by increasing the cut of balsam instead of spruce. Investigation has already gone far enough to disprove absolutely the frequent assumption that such lands can be cut over every twenty years and the same amount of material secured as before. One heavily-culled lands it will probably be found that henceforward a period of from thirty to sixty years must elapse between cuttings if only spruce and balsam are to be removed.

Reliable estimates of the amount of timber which has gone into the shoring up of trenches and dugouts, into the miles and miles of trench sidewalks and corduroy roads, and into artillery and trench screens are not available, but the quantity, on the hundreds of miles of front surely totals up to several hundreds of millions of feet. On the statement of a French colonel, it is learned that as high as 30,000 trees were used daily by a single French army corps.

Wood products are a very important factor entering into the manufacture of munitions, for without charcoal, black powder, used in such large quantities in explosives, especially shrapnel, would be denied us. Rosin, a product of our Southern yellow pine forests, is used by the thousands of barrels in the manufacturing of shrapnel, serving to hold the bullets in position in the explosive shell head. Acetone and alcohol, essential to the manufacturing of high propellant explosives, are a product of wood distillation, while muriatic acid, sulphuric acid, and chloroform are products secured from the refuse of our pulp mills. It may also be a surprise to some that one of the lard substitutes, which many housewives use in their kitchen, may be and is provided in limited quantities from the wastes of some of our pulp mills.

Wood converted into pulp has countless uses, and its manufacture bids fair to become one of the most important forms of industry related to our forests. For war purposes we find pulp converted into paper shirts for Russian soldiers, vests, socks, and handkerchiefs for the civilian population in Germany and Austria, into blankets and clothing padding, into a soft, absorbent substitute for cotton for surgical purposes, and into a tough paper for surgical dressings and boards for splints.

The wood cellulose is also reported to be in extensive use in Germany as a substitute for cotton, in the manufacturing of a gun-cotton. In our own country wood pulp is now used for making string, fibre board, chairs, insulation pipes for electrical purposes, car wheels, and a thousand and one other purposes.

Newfoundland operators report that they are having much difficulty in obtaining a sufficient number of men to operate their camps, and that, although higher wages are being offered continually, the scarcity continues.

Ontario Retail Association Progressing

Committees Appointed by Each Local District for General Meeting of Provincial Retailers—Western Ontario Trade Enthusiastic

A meeting of retail lumbermen of the district of Western Ontario was held at Hamilton, on December 3, for the purpose of considering the proposal to form a Western Ontario retail lumber dealers' association, as part of the proposed general Ontario retail lumber dealers' association. The meeting took place at the Royal Connaught Hotel, and was preceded by a luncheon. Mr. Thomas Patterson, of the Patterson-Tilley Company, Hamilton, occupied the chair, and the others present were: H. Crosthwaite, Patterson-Tilley Company, Hamilton; M. Cole, Cole Lumber Company, Hamilton; J. H. Rutherford, Cole Lumber Company, Hamilton; H. McDonald, Barton Lumber and Supply Company, Hamilton; C. C. Lawson, Wise Lumber Company, Hamilton; C. H. Taylor, Hamilton Lumber Company, Hamilton; Guy H. Long, Long Lumber Company, Hamilton; M. Zimmerman, Consumers' Lumber Company, Hamilton; E. Hind, Beaver Iumber Company, Hamilton; C. C. Smith, J. J. Smith & Sons, Hamilton; Fred Taylor and W. J. Atichison, D. Aitchison & Co., Hamilton; S. J. Shirton, Dunnville; S. Leggatt. Gibraltar; A. S. Nicholson, Burlington; Joseph Bowman, Dundas; W. C. Laidlaw, Laidlaw, Laidlaw Lumber Company, Toronto, and H. Boultbee, editor of the Canada Lumberman, Toronto.

Mr. Patterson opened the business meeting by explaining the proposal for the formation of an organization. He stated that there were five local organizations to be formed in Ontario, all of which would send representatives to a general meeting to be held at Toronto at an early date for the purpose of forming a general association to cover the whole of the province. The plan is that the general association shall take charge of such matters as are of mutual interest to retailers throughout Ontario, and that the more local affairs shall be dealt with by the local associations. It is believed that a plan of this nature will work out satisfactorily, and that many matters now neglected can be dealt with effectively so as to promote the well-being of the whole trade.

Hamilton Trade All Ready

Mr. Patterson believed that all the members of the trade in Hamilton were in favor of this proposal and that already a large number of others in the other parts of the western district were in sympathy. He suggested that all the members present should express their opinions upon the subject, and that then they should attend to the necessary passing of motions to put the matter in formal shape. First of all he called upon Mr. Walter C. Laidlaw, of Toronto, who has been taking much interest in the proposal and has been instrumental in developing it in the other four districts of the province.

Mr. Laidlaw spoke briefly, outlining the movement and referring to the various matters that such an association will be able to deal with. He drew attention to the fact that organizations existed in almost every other line of business except the lumber business. The insurance companies, banks, and even the churches, were thoroughly organized, but lumbermen, particularly the retail lumbermen, were still working on the individual plan and neglecting the great benefits of co-operation. Although lumbermen had not done much in the way of getting together, there was now a feeling among many dealers in Ontario that the time had come for doing so. He believed that there were now quite a sufficient number of dealers in the province in favor of forming a body which would represent this important branch of the lumber trade. There were a number of matters that such an organization could deal with more successfully than individuals. Legislation, for instance, could be carefully watched, so that the interests of the retailers would be promoted instead of being neglected. Transportation matters could be centralized with the association in such a way that it would be possible to obtain much more satisfactory service. There were many other matters which could be similarly dealt with to the mutual benefit of all the trade.

Mr. H. Boultbee, Toronto, followed Mr. Laidlaw, and dealt more in detail with the activities of the proposed association, which would include, in addition to transportation and legislation problems, such matters as insurance, credit bureaus, standardizing of costs, plan books, lumbermen's training courses, advertising, etc.

Mr. Patterson then referred briefly to the necessity for adopting a set of grading rules, so that they might know what kind of stock they were ordering and avoid the disputes that were now so frequent on account of misunderstanding in regard to grades. He referred particularly to the matter of matching, calling attention to the fact that frequently tongue and groove stock obtained from one mill did not match that from another mill. He thought that an association of retailers could advantageously take up this matter and induce the manufacturers to standardize their matching.

Publicity for Retailers

Mr. Guy H. Long, Hamilton, stated that he had frequently visited Buffalo, Detroit, Chicago, and other United States cities, and had been greatly impressed with the benefits from organizations among the trade. In the matter of advertising, for instance, he noticed that some of the United States associations were pooling their efforts so as to produce greater results, and were educating the public up to a much greater appreciation of lumber as a building material. This was precisely the class of work that a retail dealers' association could take up in Ontario with much benefit. Standardizing their cost accounting systems was another matter of importance in connection with which they ought to co-operate. How many dealers in Hamilton, for instance, knew exactly what it cost them to do business? He thought the number was very small. If they would co-operate in the study of this problem, they would undoubtedly be able to work out extremely valuable cost information. The retail lumber dealers all had their troubles with the railway companies. As individuals they were able to accomplish practically nothing. They could simply lay their facts before the railway company or the car service bureau, and accept whatever kind of treatment was handed out to them. If they were able to go before the railway companies or the Dominion Board of Railway Commissioners as an organized body they would undoubtedly exert far more influence and frequently obtain results that would otherwise be impossible.

Then there was the matter of developing a more friendly feeling among the members of the trade. Even if they did nothing else but increase their confidence in one another they would be accomplishing something of great value. Through an organization they would immediately begin to get closer to one another as business friends. The time had gone by when it was considered a good business policy to knock one's competitor. To-day they had to get together if they wanted to progress. The benefits they would thus receive from an association would more than pay for the time and trouble and expense devoted to it, and their business dealings would be rendered iinfinitely more pleasant.

Mr. S. J. Shirton, Dunnville, expressed his strong approval of the plan to organize. He believed it was a move in the right direction and would be a great benefit to everybody. The retail lumber dealers had been far too slow in coming to a realization of the truth of the old adage, "United we stand, divided we fall." There were forces working against the interests of retail lumber dealers which were too great for them to handle, but which they could overcome in many cases if they were united. An example in connection with transportation troubles was one which had recently come to his attention. A certain carload of lumber which he had purchased turned out to be overweight, and the railway company insisted upon being paid for the excess on a "less than carload lot" basis. This was a new idea to him, and it seemed to him that the railway had no right to charge in this manner; but as an individual his chances of having the matter settled in the way he thought proper were very slight. Another matter that he thought it would we well for an association to handle was that of advertising. It was remarkable how much money was being spent by the manufacturrs of substitute roofing materials, which were making great inroads on the market for cedar shingles. He was convinced that the cedar shingle was by far the best kind of roofing material that anyone could use, yet it was losing its market because it was not aggressively advertised. As an association they would be able to put on an advertising campaign of this nature and get results.

Co-operation With Architects

Mr. A. S. Nicholson, Burlington, referred to the importance of co-operating with the architects. As individual lumbermen they could do nothing of this kind, but as an organization they would be able to enlist the interest of the architects, and would probably find them very ready to co-operate in many ways. A case in point was one which came up in his business a short time ago. A contractor had asked him to figure on a bill, and he did so, telling the contractor at the time that he was figuring on using stock doors. Finally, when he got the bill, he found that, although the door specified was very similar to the stock door on which he had figured, there was just enough difference in detail to make the cost on the house $56 greater. Having taken the precaution to warn the contractor on this point in advance, he got out of this difficulty all right and the contractor was stuck, but Mr.

Nicholson himself had been stuck many times previously on similar transactions in which he had not been so careful.

Mr. Nicholson was convinced that the retail lumber dealers were carrying far too many lines. For instance, their stock included a great many kinds of moulding. He was sure that they had much moulding on hand which was really dead stock, and he did not know how they would ever get rid of it unless it burned up. This way of doing business was unwise, and was one of the reasons why retail lumbermen, although they worked just as hard as anybody else, were not making as much money as other business men.

Mr. W. J. Aitchison and Mr. Fred Taylor, of D. Aitchison & Co., Hamilton, also spoke briefly.

Mr. Walter C. Laidlaw again spoke for a few minutes, saying that there were a great many retailers who were not yet educated up to the association idea, and on account of these it would possibly be a rather slow matter to get the association up to anything like its possible limit of membership and efficiency. The retail lumber dealers were the foundation of the lumber industry, and it was of great importance that an organization of this sort should be carried out, and that all those who took an interest in its formation should also take a very definite interest in the hard work that would be necessary in order to carry it along until it became as important and successful as it deserved to be. The importance of the retail lumber trade was based largely upon the fact that it reached the ultimate consumer. For this reason he thought that the retailers ought to be able to lay down the rules for guiding the welfare of the trade far more definitely than they had been doing in the past. In short, they ought to be able to tell both the wholesaler and the consumer that they bossed the situation.

The chairman then called for a vote upon the advisability of organizing and all present indicated their approval of the plan.

Western Ontario Committee

A lengthy discussion followed in regard to the appointment of a committee to represent the Western Ontario district at the general meeting. The desire was that the committee should be as representative as possible, and that it should also be composed of men who were ready and willing to do their utmost to bring about the success of the movement. The committee as finally selected consisted of Messrs. Thomas Patterson, Hamilton, convener; W. J. Aitchison, Hamilton, secretary; A. S. Nicholson, Burlington; Joseph Bowman, Dundas; K. Hall, Kitchener; Dr. Davis, St. Catharines; Mr. Reid, Niagara Falls.

A discussion then took place as to the most convenient date for holding the general organization meeting. It was felt that it should not take place until after the Dominion elections and that it should not be postponed until after the new year. For this reason the available time was narrowed down until the week beginning December 17, and it was concluded that probably the most convenient date would be Friday, December 21.

The organization of the Western Ontario district completes the five local organizations for Ontario. The other meetings have already been reported in the Canada Lumberman, and the representatives appointed, who will attend the general organization meetings are as follows: Eastern Ontario: G. P. Davidson, Estate James Davidson, Ottawa; George M. Mason, George M. Mason, Ltd., Ottawa; C. H. Walters, McAuliffe-Davis Company, Ltd., Ottawa; F. R. Anglin, S. Anglin & Co., Kingston; F. S. MacFarlane, R. MacFarlane & Co., Ltd., Montreal; J. E. Lowey, Brockville Lumber Company, Brockville; D. Carkner, D. Carkner & Co., Kenmore; W. A. Cheney, Vankleek Hill Manufacturing Company, Vankleek Hill; C. R. Robertson, W. C. Edwards & Co., Ltd., Ottawa; E. M. Barrett, Barrett Brothers, Ottawa.

Central Ontario: William Barrett, Canada Lumber Company, Weston; A. C. Reesor, Locust Hill; J. B. Reid, Toronto; T. H. Hancock, Toronto; W. J. Hetherington, Toronto; William H. Thomson, Port Credit.

Northern Ontario: Howard Hesson, Sault Ste. Marie, president; J. A. Laberge, Sudbury, secretary; Henry Knight, Burk's Falls; A. J. Young, North Bay, and Mr. McKinnon, New Liskeard, vice-presidents.

Southwestern Ontario: B. F. Clarke, Glencoe; James Scofield, Windsor; Charles Hubbell, Thamesville; George H. Belton, London; W. A. Hadley, Chatham; E. C. Russell, Windsor, and J. McGibbon, Sarnia.

The United States Steamship Company, New York, N.Y., has been awarded a contract by the United States Shipping Board for the construction of steel and wooden vessels to the value of $18,000,000. The company already had contracts to the extent of $18,000,000, and expect to close further contracts for a similar amount, which will make its total in the neighborhood of $54,000,000.

John P. Conlon, Thorold, Ont., well known to the lumbermen of Ontario on account of his extensive lumbering interests on the Georgian Bay, died recently at Tuscon, Ariz.

Toronto Lumbermen Extending Help

Committees Appointed to Assist in Halifax Relief and to Furnish Firewood for the Poor of Toronto

A largely-attended meeting of the lumbermen of Toronto was hurriedly called on Monday, December 10, for the purpose of discussing the advisability of co-operating in order to send assistance on behalf of the lumber trade of Toronto to the people of Halifax. The meeting was called as the result of a suggestion received from Mayor Church by ex-Mayor Oliver, of the Oliver Lumber Comapany, and was held in the Board of Trade Council Chamber. Mr. Joseph Oliver occupied the chair, and explained why the meeting had been called.

There was a lengthy discussion of the whole situation, and Mr. Oliver explained that a meeting of the City Council would be held at 4 o'clock in the afternoon to discuss what the city of Toronto should do in connection with sending aid to Halifax. He suggested—and it was the opinion of the others members of the trade present—that a committee should be appointed to attend the meeting of the City Council, offering the co-operation of the lumbermen of Toronto in any way that was deemed advisable. It developed in the course of the discussion that, so far as lumber was concerned, the most advisable plan would be to purchase stocks in New Brunswick or elsewhere in the East which were close to Halifax and could be sent in with as little delay as possible. There was so much doubt as to what stocks were wanted and what was available in the East that nothing definite could be done, short of appointing a committee and undertaking to back up substantially any decision that was reached. On motion of Mr. J. L. Campbell, seconded by Mr. John Firstbrook, the following committee was appointed: Joseph Oliver, Hugh Munro, W. J. Smith, T. H. Hancock, and C. W. Wilkinson, who were advised by the motion that the Lumbermen's Section of the Toronto Board of Trade was heartily in accord with the proposal to do anything that was possible to relieve the suffering at Halifax, and would stand behind whatever action the committee might take. This committee subsequently attended the meeting of the City Council, and the members of it were appointed upon the general civic committee to deal with the whole question.

Before the meeting adjourned Mr. W. J. Smith drew attention to the fact that there was a great deal of suffering in Toronto on account of the shortage of fuel among the poorer classes, and he suggested that the lumbermen of the city should make arrangements to have a number of carloads of slabs brought into the city and distributed to the poor, at the expense of the lumbermen. This matter was discussed in detail, and a committee was appointed, consisting of W. J. Smith (chairman), W. C. Laidlaw, W. A. Firstbrook, and C. W. Wilkinson, to enquire into the situation and to dispose of the slabs in such a way as might be found to be most advisable.

On the suggestion of Mr. Walter C. Laidlaw, a canvass of those present was taken to obtain a rough idea of the quantity of slabs they would undertake to furnish. This canvass resulted in members present pledging themselves to the extent of about twenty carloads. There were about twenty-five lumbermen present, and it is believd that among the others who were unable to attend the meeting on account of the short notice obtained several more carloads will be promised. This committee reported also to the City Council, who expressed their appreciation of the offer and stated that they could distribute four carloads of slabs in Toronto immediately. The committee undertook to furnish these and a further quantity when the city should ask for it.

Shipbuilding Employees Drank Poisoned Tea

Eleven employees of the Toronto Shipbuilding Company, whose plant is located at the foot of Cherry Street, Toronto, were poisoned on December 10, as a result of drinking tea for their luncheon from a strange packet which had been left near their tea kettle. It is thought that the poisoning is the result of a direct attempt on the part of enemies of the country to cripple the operations of the Toronto Shipbuilding Company's plant so as to delay it in turning out vessels for the Imperial Munitions Board. Fortunately, the men were hastily taken to the Emergency Hospital, near by, and given medical treatment without delay. Had this not been done it is expected that several of them would have died. As it was, all the men were very seriously ill, but have pulled through.

Hardwood Manufacturers Annual

The Board of Governors of the Hardwood Manufacturers' Association of the United States has called its sixteenth annual meeting, to be held at the Hotel Sinton, Cincinnati, Ohio, Tuesday and Wednesday, February 5 and 6, 1918. It is the purpose of the association to make this meeting one of much practical value to the producers and consumers of lumber. A program is being prepared with careful consideration of to-day's problems and conditions. The program will contain the names of several men of national reputation, experts in their respective lines.

New Minimum Weights for Lumber Cars

Railway Commissioners Issue Order Complying with Request of Lumbermen to Lower Increased Weight Tariffs of the Railroads

In connection with the complaint of the Canadian Lumbermen's Association, the Lumbermen's Section of the Toronto Board of Trade, and others, against the increased carload minimum weights for lumber, both domestic and export, published to take effect on varying dates since April 22, 1917, the Board of Railway Commissioners for Canada have issued a finding, in part, as follows:

At a hearing in Ottawa on July 17, 1917, there was heard the complaint against the proposed increase on the minimum weights of rough forest products. Tariffs providing for such increases were filed by the G.T.R., C.P.R., C.N.R., T.H. and B., and the Temiscouata Railway Companies. The increases were also provided for by the Intercolonial. Exception was taken by shippers and their representatives to the increases, in so far as lumber loaded in box cars is concerned.

The following table summarizes the proposed increases:

	New.	Old.
Cars under 35 feet long	40,000 pounds	30,000 pounds.
Exception—If car fully loaded, will not contain 40,000 pounds..	35,000 pounds	No exception.
Cars 35 feet to 36 feet 6 inches ...	45,000 pounds	34,000 pounds.
Exception—If car fully loaded, will not contan 45,000 pounds..	40000 pounds	No exception.
Cars over 36 feet 6 inches	5 per cent. per foot added to 36 feet 6 inches minimum.	

Cars 35 feet and under constitute only a small percentage of those in service. Cars over 36 feet 6 inches in length are given the same treatment as hitherto. This phase of the matter is not in issue.

The tariffs contain a provision allowing a reduction of 5,000 pounds when a car loaded to full practicable capacity will not contain the higher minimum.

The difficulties in the way of obtaining a uniform loading are recognized. The weight that can be loaded into a particular car varies with the density, seasoning, and dimensions. A check made showed that "shorts" 6 to 11 feet in length, loaded into a 36-foot car had a loading of 45,600 feet. On the other hand, with lumber 12 to 16 feet in length it is impossible to load three lengths of lumber end to end in a car 36 feet long.

The evidence as set out shows that in general lumber loads heavier than the old minimum and frequently heavier than the new. There are also many instances where the load is lower than the tariff weights.

Exhibit No. 14 gives the total shipment of export lumber shipped to Montreal for the years 1912 to 1916, inclusive. Export lumber may be taken as characterized by efficient loading. This shows the following results:

Cars.	Average feet b.m. per car.	Average weight per car in pounds.
2,105 white pine	16,559	39,419
1,574 red pine	15,589	42,826

The combined averages are 16,144 feet b.m., and 40,904 pounds per car.

Mr. Bremner, for Watson & Todd, Ltd., filed a statement showing the railway weights of 384 carloads of white and red pine and spruce to Montreal for the export season of 1916, with the following results:

	Cars	or	Per cent.
Weighing 34,000 pounds or less	23		6
Weighing over 34,000 pounds to 40,000 pounds	91		24
Weighing over 40,000 pounds to 45,000 pounds	119		31
Weighing over 45,000 pounds	151		39
	384		100

The average load was 43,567 pounds, although 39 of the cars measured over 36.6 in length. So far as the averages go, this result would justify the carriers' "exceptional" 40,000 pounds minimum as the standard, instead of their standard of 45,000 pounds. However, the application of the 40,000 pounds weight as the standard would penalize some 87 cars of over 35 feet in length, or about 24 per cent. of the total of such dimensions, which averaged less than 40,000 pounds, but in excess of 35,000 pounds. A minimum predicated on the arithmetical average would be fair, no doubt, if the railways did not weigh the cars; but as they do, although the minimum ought to conform in a measure to the average under the circumstances, it ought also to lean towards the lighter loading.

The railways advocate the proposed increases with a view to obtaining heavier and more efficient loading. With the existing situation in regard to rolling stock, it is in the shippers' interest to have as efficient loading as possible. This was not contested by shippers at the hearing. What is involved is what, considering all the circumstances, is reasonably heavy loading.

As arranged at the hearing, the board's officials have made checks of actual loadings, and it appears that it will be reasonable to arrange as follows:

	Pounds.
For closed cars under 35 ft. in length, inside measurement ..	35,000
Except that when cars loaded to full capacity will not contain 35,000 pounds the minimum will be the actual weight, but not less than	30,000
For closed cars 35 ft. and not over 36 ft. 6 in. inside measurement	40,000
Except that when cars loaded to full capacity will not contain 40000 pounds the minimum will be the actual weight, but not less than	35,000

Note.—The term "full capacity" permits a space of 12 inches between the top of the load and the car lines or rafters of the car.

Order may issue accordingly.

Duke of Devonshire Visits British Columbia Mill

His Excellency the Duke of Devonshire, together with his party and a number of leading officials and citizens of Vancouver, B.C., recently inspected the Hastings mill of the British Columbia Mills, Timber, and Trading Company. The party was conducted through the mills by Mr. Eric W. Hamber, general manager, and Mr. Arthur J. Hendry, general superintendent. A complete tour of the plant was made, and the party saw in detail the manufacture from the log to the finished product, including a large quantity of specially selected timbers for airplane construction. Timbers were also shown which were being manufactured for trench work and railway work behind the lines in France. In another section of the mill the party saw a large quantity of material to be used in the construction of vessels for the Admiralty. Another feature of the stock shown was a large quantity of material for Australia, Japan, South Africa, etc. At the wharf a vessel was shown moored, with over a million feet of lumber on board ready for shipment across the ocean. His Excellency expressed great interest in the industry, and said: "I had no idea that the lumber industry was such a gigantic one." As His Excellency left the mills the 1,200 employees lined the roadway and cheered him enthusiastically.

Many Working Class Houses Needed in England

The United States consul at London, England, in a report upon the housing problem in Great Britain, says:

"One of the most important questions in Great Britain for several years past—and one which has assumed political prominence at many electoral campaigns—is that of the housing of the working classes. This subject is now being taken in hand by a departmental committee appointed by the government. It is admitted by the board that 500,000 houses are now urgently wanted, but other authorities estimate that not less than 1,000,000 houses are necessary, costing $1,216,625,000.

"On the question of finance, government aid has been promised. In the meantime a grant of $97,330,000 has been asked for by some housing organizations. The government in November, 1914, decided in favor of a free grant from the exchequer, as well as loans, to permit of local councils charging customary interest without incurring loss; and, while that policy is still in force, it has, so far, only affected certain munition areas.

"It is recognized that overcrowding has been one of the causes of industrial unrest, especially in districts where war work is particularly heavy; and that bad housing has led to high infantile mortality, notably in the northern industrial centres. In three Scottish districts there is immediate urgent need for accommodation for 100,000 workers.

"Since 1905 there has been a decrease in the building of houses for the working classes. With the outbreak of war practically a complete cessation of small house building set in, except in munition areas.

"It is reported as certain that at an early date government approval will have been granted to plans involving the erection of not less than half a million houses within the first two years after the conclusion of the war, and that, in order to prevent rents being higher than in pre-war times, financial assistance will be substantially provided."

Portable House Rumors Criticized

United States Firms Report That Little or No Trade Has Developed—Possibilities all in the Future

There has been quite a revival recently of the discussion about the trade in portable houses required by France. Such information as was available upon this subject has been published from time to time in the Canada Lumberman, and recently the matter was dealt with editorially in these columns, at some length. Reference was made, in some of the correspondence received by us on this subject, to orders which were said to have been obtained by United States firms, and the inference was that Canadian firms had been neglecting their opportunities. In order to enquire into the facts in this connection the Canada Lumberman sent a circular letter to a number of large firms in the United States which are in a position to cater to this trade, asking them for such information upon the subject as they felt inclined to make public. Three replies were received. One is from the Gordon-Van Tine Company, of Davenport, Iowa; another is from the Illinois Lumber Yards, of Cairo, Ill., and the third from the Aladdin Company, Bay City, Michigan. All three replies suggest that there has been much more smoke than fire in connection with this situation, and readers of the Canada Lumberman who have been inclined to criticize Canadian firms on the score of their negligence will be interested in reading these letters. While we do not present the letters as being a final utterance upon this situation, we feel that they do, to quite an important extent, verify the statement made by some Canadian firms who have advised us that the possibilities in connection with this trade all lie considerably in the future, and that about all they can do to-day is to prepare to go after this trade when the opportunity develops. The three letters referred to above are as follows:

Reports Not Based on Facts

Editor Canada Lumberman:— Cairo, Ill.

We are just in receipt of your communication requesting information relative to the various reports appearing in the press, since the beginning of the war, about alleged portable house orders received from the allied governments.

We wish to advise that we have seen in the last three years a great many articles written on this subject, and reports of alleged portable house orders, and we have had occasion to investigate the origin of same, and found that such reports were not based on facts, but merely inquiries received from the agents of the allied governments.

At the beginning of the war, when the United States was out of it, there was the promise of a great market for portable houses for France and Italy, to replace temporarily the villages destroyed during the early part of the war. The agents of allied governments went so far as to place orders in the United States for samples of both metal and wooden houses. These buildings were shipped about the time of the sinking of the Lusitania, and, as you are aware, a short time after this disaster, shipping was demoralized and ocean rates were more than trebled, which prohibited the placing of orders for portable houses. Consequently, all negotiations were dropped, and as the matter now stands, we do not anticipate that any orders will be placed for portable buildings until after the war, when there is some reduction in ocean rates. Also we do not feel there will be any great volume of this business after the war.—Illinois Lumber Yards, E. A. Kennedy, Manager.

Reports of Orders Proved Erroneous

Editor Canada Lumberman:— Bay City, Mich.

I know of no orders placed by the allied governments for portable houses in quantity since the beginning of the war. There have been many reports of large quantities running as high as 50,000 houses being shipped abroad, but in every case, when investigated, they turned out to be erroneous.

This company did ship 300 6-room houses to England this spring, and the United States Government is now manufacturing some portable barracks buildings for shipment to France.

This, I am sure, covers all the facts relating to your inquiry.—Yours truly, O. E. Sovereign, General Manager, The Aladdin Company.

Only a Few Special Orders Filled

Editor Canada Lumberman:— Davenport, Iowa.

In the summer and fall of 1915, there was a great furore in certain business channels regarding portable houses to be used in the rebuilding of France and Belgium. At that time it was thought that the buildings would be needed very quickly and a number of commission men in New York, London, and Paris, who thought they had the inside track, talked about immediate orders, and induced various factories to submit sample portable houses, which were shipped to France.

To the best of our knowledge not one of these concerns ever received an order for portable houses, nor have portable houses been shipped to Europe in any quantities. A few special orders have been filled; one for instance, being some houses for factory workmen in England.

Of course, we know now that the rebuilding of France and Belgium is a question to be settled and carried through when the war is ended. Until that time, it is our opinion that most of the talk about portable houses for the allied governments is purely preliminary.—Gordon-Van Tine Company.

Conservation Commission Meeting

The annual convention of the Commission of Conservation was held recently at Ottawa, and was largely attended. One of the chief addresses presented was that of the chairman, Sir Clifford Sifton, who referred to a number of matters which are of interest to the lumber industry. He dwelt with emphasis upon the importance of eliminating political patronage in connection with the outside service of the Forest Branch of the Department of Lands. The new Union Government, he said, had definitely fledged itself to abolish political patronage in connection with all appointments to the outside Civil Service. There was no branch of the public service that would profit more by the adoption of this principle than that of the Forest Service.

The report of the Committee on Forests reviewed conditions in connection with the administration of forests in the various provinces of Canada, stating that notable progress had been made during the past year in the direction of better conservation of our forest resources. The developments in connection with protection against forest fires were particularly gratifying. In regard to the threatened danger to white pine timber in the Province of Ontario, on account of the white pine blister rust disease, the report said that this disease had become firmly established in Southern Ontario and was threatening the white pine, especially the young growth, in the Trent watershed and the Georgian Bay District. It had also been found in several counties in Quebec. In order to control or retard the spread of this disease the most vigorous action was imperative by the Dominion Government and the provincial governments.

The report noted with satisfaction that the Provincial Government of New Brunswick is now considering the consolidation, under the Forestry Division, of the various lines of forestry and fire protection work, including the supervision of scaling and logging. Favorable action in this direction was urgently recommended.

It was recommended also that provision should be made for the extension to all forest areas in New Brunswick of the permit system of regulating settlers' clearing fires.

The Province of Quebec was congratulated upon the extension of the co-operative idea of forest fire protection to include 80 per cent. of licensed crown timber lands of the province, as well as a considerable area of unlicensed crown timber lands. The four forest protective associations now existing in the province are protecting an area of about 70,000 square miles.

The report stated that a new era in forest fire protection had begun in Ontario, and a creditable start had been made in the work of providing modern fire protection facilities for the timber of the province.

Reference was made to the study of conditions on cut-over pulpwood lands, begun last summer in the Province of Quebec, under the direction of Dr. Howe, which had shown that the popular belief that spruce and balsam timber in Eastern Canada could be cut every twenty years or so was quite erroneous, and that it would take anywhere from thirty years upward to produce a new growth of merchantable size.

Judgment Given for Damages Caused by Logs

An important lawsuit was heard recently in the Supreme Court of New Brunswick involving a case of alleged trespass and damage by the Nashwaak Pulp and Paper Company, Ltd., upon the property of S & R. Wade. The action was for damages amounting to $3,360, and was the second claim entered against this company for damages alleged to have resulted from the recent annual freshet on the Nashwaak River. The other case was that of Dinsmore against the Partington Pulp and Paper Company, which has been settled. A great deal of expert legal talent was employed in the case and widespread interest was being taken in it. The plaintiffs alleged that the company's logs blocked in the Nashwaak River and forced a jam to a depth of thirty feet, and that it took three weeks for the water to subside. They stated that the overflow caused damage to their farm to the extent above mentioned. The company entered a counter-claim of $1,000 for additional cost of removing logs and detention of logs by the plaintiffs. They pleaded that there was no negligence on their part, and that all the damage was the result of an unusual high freshet. The jury in this case was out for about five hours, and returned a verdict in favor of the plaintiffs. Judgment was given for them to the amount of $684 and costs.

Spruce Log Price Fixed

The United States Government has fixed the price of spruce logs at $35 for No. 1, $20 for No. 2, and $11 for No. 3.

Mr. W. B. Snowball, of the J. B. Snowball Company, Ltd., Chatham, N.B., attended the recent meeting of the Canadian Forestry Association at Ottawa, Ont., and visited Toronto during the last week in November.

Frame Construction Replaces Concrete

Large Food Products Plant at Chatham, Ont., Designed for Concrete but Changed to Frame

That the shortage of materials and the scarcity of labor are giving wood a good opportunity to regain some of the business it lost to competitive building materials previous to the war is indicated by the fact that frame construction is relatively more extensive to-day than it was, Not only is this type of construction getting a greater share of business, but one hears, upon occasion, of buildings being planned of reinforced concrete, but being changed to the frame construction type, because of its lower cost and satisfactory results. An instance of this is the large food products plant erected this year at Chatham, Ont., for the Libby, McNeill & Libby Company, of Chicago.

The original plan called for reinforced concrete construction, with a large additional building in front, but the plans were changed and the plant was built of frame construction type.

The plant as built at present comprises a group of five buildings—boiler-room and tomato products building on one side and canning building, tank and process building and cabbage bin on the other side, a space of 74 feet being left between the two rows of buildings for unloading platform and two tracks.

The tomato and canning buildings are both 80 ft. x 160 ft., one storey high, of frame construction, the tomato building having a mezzanine deck 32 ft. x 80 ft. and two large covered receiving platforms. The basement floors are of concrete, and the main floors of 2 in. flooring, laid on a sub-floor with three-ply slushing between, the finished floor being caulked with asphalt. Both buildings are provided with electric elevators.

The tank and process building is 80 ft. x 240 ft., one storey, of frame construction, with a second storey part 32 ft. x 64 ft. The foundation is composed of concrete piers, with brick panels between. The tank department is 80 ft. x 180 ft., and is devoted to storage tanks and vats. The process part is equipped with a waterproof floor, the basement underneath being used for storage purposes.

The cabbage bin is 40 ft. x 70 ft., one storey and full monitor, with driveway through the centre and hopper bins on each side. The basement walls are of concrete, hopper floor of concrete, and the superstructure of frame.

Mill Work an Important Item

The buildings being mostly of frame construction, the lumber and mill work became a very important factor of the material department, the total requirements in this line amounting to nearly 1,000,000 feet of timber and dimension and 120,000 feet of mill work. frames, etc. The timber and dimension specifications called for long leaf yellow pine and British Columbia fir, all surfaced on both sides. It was found impossible to get other than mill delivery on surfaced stock of the required sizes and no definite time of shipment. To meet this difficulty transit cars of rough stock were picked up by the lumber department and diverted to Chatham. In the meantime a stock yard was established near the industrial spur, and in the short time of three weeks all the timber and dimension had been delivered and properly piled, ready for milling.

A small mill shed was erected in connection with the stock yard and a 16 in. x 24 in. four-side surfacer and matcher installed. All the surfacing and matching was done on this machine, the material being handled to the machine by a system of rolls and tramway. A large band resaw was also brought into use for resawing all larger sized timbers to the proper dimensions, the cuts or offals being worked into dimension stock.

The stock yard and mill were placed in charge of a competent mill man, who got out the material on orders from the carpenter foreman and delivered it as directed by him.

A reserve stock pile for small dimensions and finishing material was established near the main buildings. A portable woodworker was housed nearby, and a large amount of light framing and cutting was done on this machine. It was originally decided to move the woodworker from place to place as needed, but it proved more advantageous to keep it near the stock pile. In this manner all cuttings were in one place, and no time was lost by the woodworker, the cuttings being worked into bridging and lookouts when the machine was free from framing. The small items were stored in part of the woodworker shed, and were always ready for use when needed.

Lack of Experienced Carpenters Handicapped Work

The contractors were greatly handicapped by lack of experienced carpenters and helpers, and the organization plan for this end of the work could not be carried out in the manner desired. However, the following system was adopted, and, after a short time, proved satisfactory.

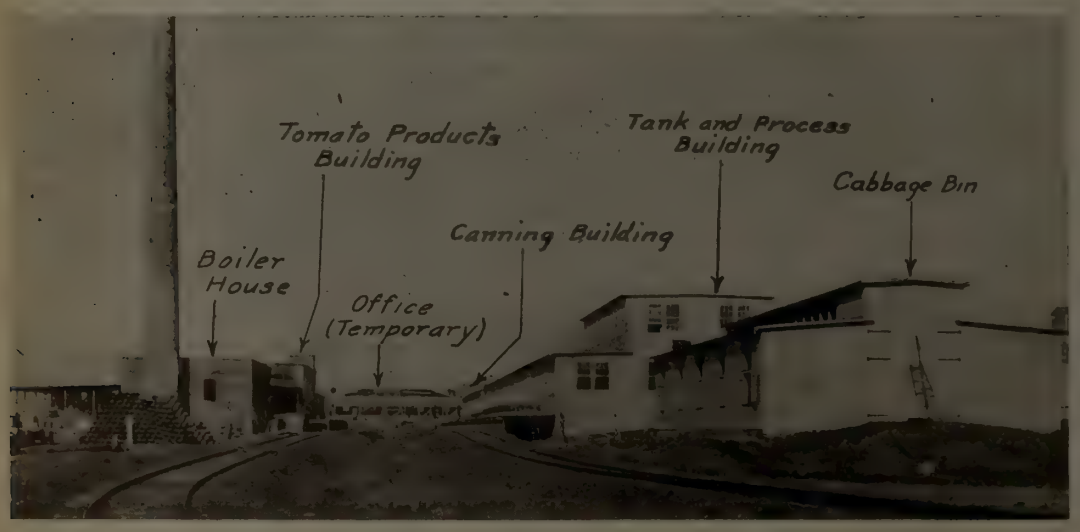
The work was in charge of a general carpenter foreman, assistant foreman, and two gang foremen. The carpenter and helpers were divided into three gangs, namely, framing, erecting, and sheathing gangs, care being taken to have a few experienced men in each group. After the buildings were enclosed the men were again divided, the more capable being worked on the interior finish, siding, etc., while the balance were placed on platform work. In this manner the work was carried forward promptly., and all carpenter work completed within seventy-five days.

The Meaning of Cost

By W. S. Webb

The retail lumber trade is an intricate business, combining large investment, hard work, and considerable risk with small profits, or, as happens, no profits at all. We know of hundreds of retail lumber yards scattered about the country, and, with few exceptions, their profits are small—out of all proportion to the amount of capital involved and the hard work required to keep them going. Why is it?

It is said that competition prevents us from getting prices that show a reasonable pront, and undoubtedly that is true. Intelligent competition—the right kind of competition, however, does not prevent our success. It is the bad competitor—the fellow who fails to make any success himself and by his methods and prices prevents his neighbors from making a success of their business—who is the menace to the trade. The bad competitor is usually one who does not know what it costs him to do business. We all have some idea of the cost of doing



General view of Libby, McNeill & Libby Company's plant. Buildings arranged in two rows with tracks between.

Buildings are of frame construction.

business, but very few of us realize just how much it actually does cost. It can be easily understood that we must take into consideration every item of expense in conducting our business and add it to the cost of our lumber before we can make any profit. Some of the items that enter into our costs of doing business are rent, interest, insurance, depreciation of plant and stock, stable and garage expenses, bad debts, salaries and office expenses, and labor. Now any of us who do not see to it that each thousand feet of lumber he sells carries its proportionate share of all these items of expense before adding his profit is fooling himself.

There are many different methods of apportioning these expenses —some apportion expenses at so much per M. feet on the quantity of lumber handled; others on a basis of percentage of sales. I have priced lumber by using a combination of both the methods mentioned. About a year ago an effort was made by a group of Brooklyn retail dealers to ascertain the cost per thousand feet of lumber of doing business in the Metropolitan district. As I recollect it, practically all the yards responded, and the average cost per M. feet of lumber was found to be $8.

This averages up pretty well with my own method of figuring, which at that time showed costs of about $5 per M. on lumber costing $20 per M. up to $23 per M. on lumber costing $100 per M. Undoubtedly to-day the cost of doing business would be at least $1 per M. more.

On a percentage basis the average cost of doing business in the Metropolitan district would seem to be about 20 per cent. on the selling price—mind, I say on the selling price, not on the cost price. There is a big difference. Twenty per cent. on the selling price would represent 25 per cent. on the cost price, and I have met men in the retail trade who were satisfied to add 25 per cent. or less to their cost price and felt they were making a profit.

Twenty-five per cent. added to the cost price equals only 20 per cent. on selling price, and this 25 per cent. added to its cost the average yard must have to break even.

Thirty-three and one-third per cent. on cost equals 25 per cent. on selling price; 43 per cent. on cost equals 30 per cent. on selling price; 50 per cent. on cost equals 33 1/3 per cent. on selling price; 100 per cent. on cost equals 50 per cent. on selling price.

Consequently, on a basis of 20 per cent. overhead to make 10 per cent. net profit it is necessary to add 43 per cent. to our cost.

It seems to me that it would be a great benefit to the retail trade if some uniform system of figuring costs could be adopted. Nothing I can think of at the present time would have the same effect in putting competition on a more satisfactory basis. A system for this purpose should not be complicated, and I am inclined offhand to favor the percentage system as being the simplest system and one that would answer as well as any other perhaps if adopted generally by the retail trade. Just take the cost of your lumber and add 50 per cent. Of course, we haven't any of us been getting that—at least, not as a steady diet—but, to my mind, we should get it.

Why is it that men in other lines of trade seem to make so much more of a success of their business than does the average retail lumber dealer? There is hardly any line of business I can think of that requires so much capital and hard work as retail lumber, and still our profits—when we have any—are smaller than in almost any other line of business.

Fifty per cent. added to our cost seems like a lot of money, but let us see just what is represents in the way of profits. Fifty per cent. on cost equals 33 1/3 per cent. on selling price. Our overhead is 20 per cent. on selling price; profits about 13 per cent. Now, 13 per cent. is not too large a profit to be made in the retail lumber business. At any rate, we ought not to figure to make less than 10 per cent., and that means, according to the percentage system, 40 per cent. added to the cost of our lumber. Some higher than we have been accustomed to figuring, isn't it?—but think it over.

The Return of the Wooden Ship

A contributor to the Standard Oil Bulletin (San Francisco) says:

"The wooden ship has come back. As an auxiliary, powered with internal combustion oil-burning or Diesel engines, she is fast gaining recognition as a reliable and economical freight-carrier, and a worthy competitor of the steel steam-powered vessel which had all but forced her off the seas.

"The shortage of steel and demand for bottoms created directly or indirectly by the war, coupled with a fuller realization of the practicability of the Diesel and semi-Diesel engines in the larger-sized freight-carrying vessels, have led to marked activity in the building of these wooden auxiliary ships, or motor-ships, as they are known. Those who have bemoaned the passing of the wooden ship will find in this new type of vessel a worthy successor to the wooden ships of other days, for, though she has not perhaps the grace and beauty of the 'clipper' ship, she does have the charm that must always lie in the vessel made of wood, with the added advantage of independence of the winds. She has about her the same smell of the forest, the same elusive spirit that seems to make her a living thing, as though into her hull had entered the life of the tree; and in the shipyards where she is building to-day are to be found (if one will close his ears to the insistent clangor of the pneumatic hammer and his eyes to the swiftly-moving steam hoist and great crane) the same sights and sounds that were known to our fathers' fathers a half-century and more ago in New England. The demand for the motor-ship has quickened this old industry of wood shipbuilding into new life, in which rejuvenation no country is more active than our own and no section more productive than that bordering on the Columbia River in Oregon. And nowhere so well as in Portland and vicinity should this new-old industry flourish, for in Western Oregon and Washington, and within a comparatively few miles of the city, are standing over four hundred billion feet of Douglas fir, much of it from three to five feet in diameter and 175 to 250 feet in height, yielding an almost inexhaustible supply of a wood ideal for shipbuilding, because of its light weight, strength, durability, non-shrinking property, and easy workability. Coming in such lengths, splicing is reduced to the minimum.

"As though it were not enough for one tree to furnish immense timbers for frames and beautiful, strong masts and spars, the stumps of the Douglas fir make the best ships' knees to be had—no small item when it is remembered that several hundred knees are used in one ship for deck-beam supports.

"With this abundance of raw material at hand it is to be expected that the Columbia River cities, with their other fine natural facilities for wood shipbuilding, should enter largely into the construction of motor-ships and display the remarkable activity which is now to be seen in shipyards, old and new, from Portland to Astoria. The yards are working to capacity, new ways are being put in as fast as possible, and new companies are preparing the ground for ways. There are also, of course, several companies engaged in the building of steel vessels (which industry shows activity equal to that of wood shipbuilding) that are not mentioned herein.

More Shell Orders for Canada

Recent news despatches state that the British Government has instructed the Imperial Munitions Board, Ottawa, to issue without delay to Canadian metal-working plants equipped for the work contracts in volume covering the steel, forging, and machining of 18-pdr. shrapnel, 4.5-inch and 6-inch high explosive shells which will ensure steady employment both of men and machines for a period extending well into the new year. The success of the Victory Loan has apparently been anticipated in these orders. The decision to place further large British shell orders in Canada, coming as it does in the wake of the distribution of several million dollars' worth of 75 and 155-millimetre shells by the American Government, the placing of a huge contract for fabricated steel for United States ship construction, and the receipt of a contract by a Toronto firm to supply airplane engines to the value of some $5,000,000 to the Imperial Government will be important factors in maintaining industrial activity this winter.

John Ross, general superintendent of the Abitibi Power and Paper Company's plant, Iroquois Falls, Ont., was instantly killed by coming in contact with the company's power transmission line on December 8.

Splicing and Lacing Belts

Contributed by Dunlop Tire and Rubber Goods Company, Limited

Transmission belts can be made endless at the factory, providing the proper details, in regard to their exact length, have been furnished. This practice is recommended on the basis of the superior facilities in the factory for handling this work efficiently. Sometimes, however, it is either necessary or desirous to do this on the pulleys. There are many ways of splicing rubber belts, but the following method would seem to be the most satisfactory for users to adopt:

To ensure a good joint use about three feet of belting for the splice. Cut the belt ⅛ to ¼ of an inch shorter—according to its size—for every foot in length than the actual distance between and around the pulleys.

Step off the ends, as illustrated, allowing the following suggested length of lap per ply, according to the size of belt:

Belt width.	Length of lap.	Belt width.	Length of lap.
Up to 4 in.	3 in.	14 to 20 in.	9 in.
5 to 12 in.	6 in.	20 in. and over	12 in.

Use a heavy, sharp knife to ensure all ends being perfectly cut—not jagged. Better true up the steps with a set square.

Avoid irregularities in the steps that prevent one from fitting snugly into the other. No one step should reach over the other more than one-sixteenth of an inch, nor should any space be left between them. Remove the sharp edges by trimming the ends of each on a bevel. Distribute evenly three coats of cement, allowing each coat to dry before the application of the next is made.

When the last coat becomes "tacky," and after all gasoline has evaporated, finish the operation by joining the plies together, being sure to butt the ends accurately; then thoroughly roll down with a metal roller.

Machine for Splicing

To secure the best results, and to eliminate all possible stretch, it is expedient that the belt be reasonably tightened by draw-clamps before fastening the splice. The small and inexpensive machine, illustrated herewith, is a very efficient apparatus for this kind of work. This press is recommended for making the endless joint. The whole job can be completed with it, either in the shop or at the drive over the pulleys. To prevent the belt adhering to the press, place pieces of tin on both sides and moisten with soapy water.

Always be sure that both sides of both ends of the belt are pulled evenly, so as to prevent a crooked joint. Do not remove the press until the belt is well set. To further safeguard your work stitch the joint in rows, one inch apart. Do not cut the thread at the end of each row. As far as possible make it continuous..

A joint, if made as recommended, will be absolutely as strong as any other part of the belt, and it will be difficult for anyone to detect the splice.

Belt Lacing

Although fastening the ends of belts together by the use of a leather lace, as described below, is probably the most popular method employed, the metal fasteners illustrated are found to be very satisfactory on sizes up to 12 inches. Much better results can be obtained through splicing belts over 18 inches wide by the method explained previously.

Either one of the two metal fasteners illustrated below will give very satisfactory service to users who prefer this method of joining belts. Both of these fasteners are strong and durable, and, when properly applied, will hold securely throughout the life of the belt. The manner of attaching is simple, and takes but a very short time.

Before joining, a belt should be one-eighth to one-quarter of an inch shorter—according to size of belt—for every foot in length than the actual distance between and around the pulleys. It is important also that the ends of the belt be cut absolutely square.

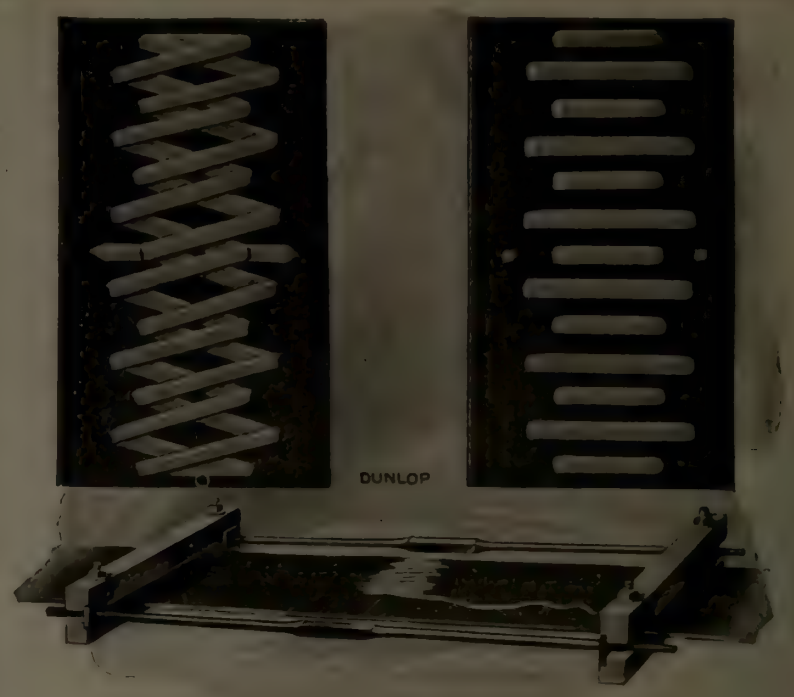
While there are many ways in which lacing can be done, the method illustrated below is most simple and effective.

The following table will give approximtaely the number of holes, which should be cut with either an oval or round punch,, and which it is advisable to make in the different widths of belting:

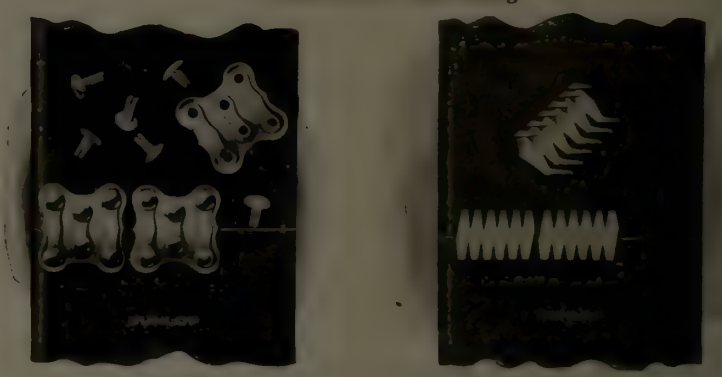
2 to 2½ in. belting	3 holes
3 in. belting	4 holes
4 in. belting	5 holes
5 in. belting	6 holes
6 in. belting	7 holes
8 in. belting	9 holes
10 in. belting	11 holes

The holes should not be closer than one-half an inch from the edge of the belt nor nearer the end than five-eights of an inch, and should only be large enough to take the lace drawn through tightly.

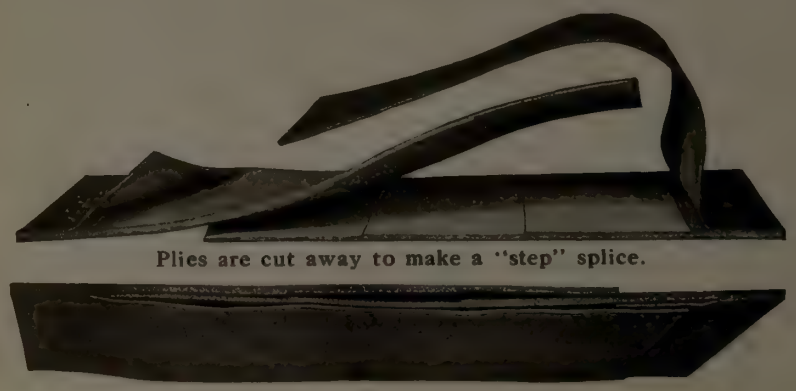
The widths of lace generally used are as follows: Belts up to 5 in. wide, 1/4 in. and 5/16 in.; belts from 6 in. to 12 in. wide, 3/8 in. to 1/2 in. Do not employ too heavy a lace, as it will form an unduly large



A method of belt lacing

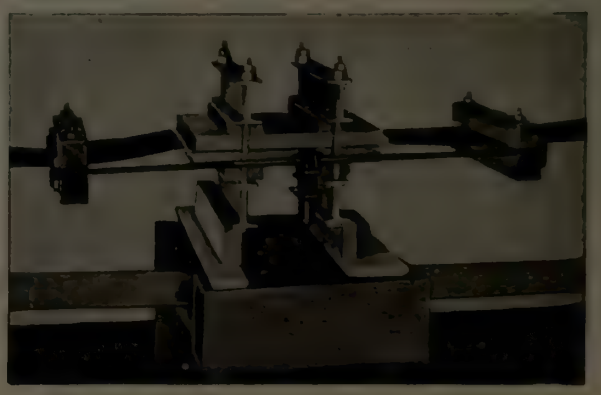


Two styles of metal fasteners.



Plies are cut away to make a "step" splice.

How stepped ends match—Belt runs to right.



Machine for making belt splices.

ridge, which will cause the belt to jump and pound on the pulleys to an injurious extent. In narrow belts, butting the two ends together and lacing is generally sufficient, but fairly wide belts require the addition of a piece of rubber-frictioned duck on the over-side.

The Importance of Including Belt Thickness

I have seen it argued that belts don't slip as much as we think.

A certain millman put a belt on a 4 inch driving pulley and made it drive a 40-inch pulley. The small driving pulley made 1,000 r.p.m. He, therefore, figured that the speed of the large pulley should be 100 r.p.m. because 1/10 × 1,000=100.

The ratio of 4 to 40 is the same as 1 to 10 you see. It seems like a very simple thing to figure, doesn't it?

However, imagine this gentleman's surprise when he found that the driven pulley ran at a speed of a trifle over 105 r.p.m. instead of 100; and, when fully loaded, its speed was 103 r.p.m.

"How does it do it?" he asked. "Instead of slipping or losing speed on account of belt-stretch, it actually gains speed on me!"

So, as a matter of experiment, he reversed the drive, making the large pulley the driver and running it at 100 r.p.m. He figured, as is ordinarily done, that the speed of the small pulley should be 1,000 r.p.m. But, lo and behold! he could only only get 948 r.p.m. out of the small pulley, even when no load was being transmitted. When the belt was stressed by a load the best he could get out of the small pulley was 929 r.p.m.

"This is terrible!" he declared. "What's wrong?"

Thereupon this gentleman "got busy" and started reading what he could find on the subject of belt transmission. He bought a book and studied it carefully, but no good did it do him. He found this parallel problem in Cromwell's "Belts and Pulleys":

"The diameters of two pulleys which are connected by one and the same belt are D=30 inches and d=10 inches. The larger pulley makes N=120 r.p.m. It is required to determine the number of revolutions per minute of the smaller pulley. From the formula we have N/n=d/D or 120/n=10/30. From this, n=30 × 120/10=360."

"By crackie!" ejaculated the gentleman; "that's just the way I worked my problem, but it doesn't come out right in practice."

He looked into manufacturers' catalogues also, but found no help until he took his troubles to a friend who is an old hand at the belt transmission game, and this friend at once told him that the trouble lay in the fact that the thickness of the belt was not taken into consideration. "You must always add the thickness of the belt to the pulley diameter in the formulas," counselled the friend.

Thereupon the gentleman made this formula out of the one that appears in Cromwell's "Belts and Pulleys":

$$\frac{N}{n} = \frac{(d+t)}{(D+t)}$$

Where N=r.p.m. of the large pulley;
n=r.p.m. of the small pulley;
D=diameter of the large pulley in inches;
d=diameter of the small pulley in inches;
t=thickness of the belt in inches.

He substituted his values which I have already given, in this formula, and, sure enough, he got 105 as a result when the small pulley was used as the driver, and 948 when the large pulley, as the driving pulley, ran at 100 r.p.m. The thickness of the belt was ¼ inch.

In order to impress this point more forcibly on the reader's mind I have, therefore, made this sketch in an exaggerated way. It shows just how puuley diameters should be measured, including the thickness of the belt, and the sketch also shows why a thick belt will "fool" the ordinary layman more quickly than will a thin one. If a belt didn't have any thickness at all, then, and only then, the formula as given in Cromwell's book would be correct.

Now, coming back to my first sentence, I have seen it argued that belts don't slip as much as we think on account of this influence of belt thickness. That, however, is not true. Belts DO slip, and it is a pretty safe bet that they always will, to some extent at least.

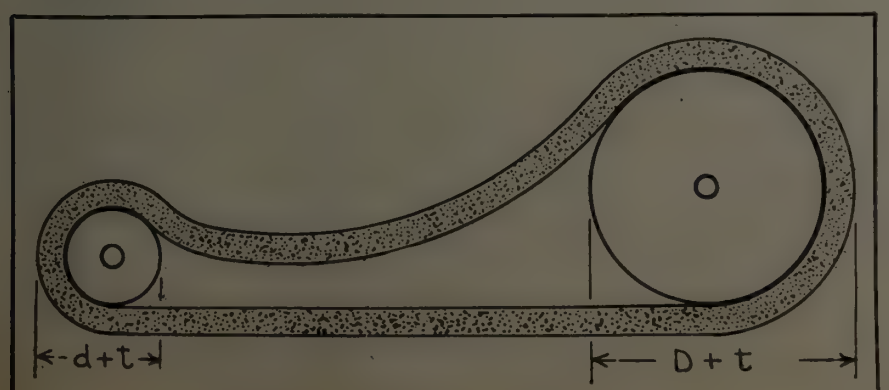


Diagram illustrating effect of belt thickness.

It is a simple matter to compute belt slip, even when taking belt thickness into consideration. This is done by using the above gentleman's correct formula as a basis, and, as a result, we have this formula:

S=R (D+t)—r (d+t)=total belt slip per minute in inches,

Where R=r.p.m. of the driving pulley;
r=r.p.m. of the driven pulley;
D=diameter of driving pulley, inches;
d=diameter of driven pulley, inches;
t=thickness of belt, inches.

Now, if you want to compute the horse-power lost, due to belt slip, use this formula:

$$h.p. = \frac{h.p. \times S}{R\,(D+t)}$$

when h.p. is the horse-power of the engine or motor given to the driving pulley.

If you will apply these correct formulas to your belt drives you will surely find that every belt that pulls any load at all is slipping to some extent. There is a power loss in every working belt, due to either slip or creep. If there is no slip there certainly is creep.

Creep is due entirely to the elasticity in the belt, and is unavoidable, so if you find that you are losing about 2 per cent. of your power through use of the above formulas, and if the belts are heavily stressed, you can safely attribute the loss to creep. But if you get a result greater than 2 per cent. you can generally be sure that something is wrong and power is needlessly going to waste. Slip can be stopped, you see, by giving the belt proper care.

A belt that is transmitting power is tighter on one side than on the other. The tighter side is stretched more than the other. We, therefore, have a longer belt going onto the driving pulley than comes off. The belt naturally has to adjust itself as it goes around the pulley to make up for this difference in length. Hence we have that unavoidable action known as "belt creep." Do you get the idea?

So, in conclusion, we must agree that belts either slip or creep, and every action can be accounted for. But, above all, when making your computations, don't forget to include the thickness of the belt.

N. G. Near.

Walter H. Shaw Honored by Associates

On December 7 the staff of the R. Laidlaw Lumber Company, Toronto, held their usual monthly dinner and meeting at the Merchants' Hotel. At the conclusion of the dinner, Mr. C. G. MacBeth, general manager of the retail department, made a brief speech on behalf of the firm and staff, in which he called attention to the fact that Mr. Walter H. Shaw was severing his connection with the firm at the end of the year. Mr. MacBeth spoke of the indefatigable attention which Mr. Shaw had given to the affairs of the firm and the great assistance which he had been to him during his time of service. Mr. Shaw has been with the company continuously for twenty-two years, and is retiring in order to take a holiday in the South and finally intends to settle down in Canada and go into business on his own account. Mr. MacBeth presented Mr. Shaw, on behalf of the firm and staff, with a travelling wardrobe trunk for himself and a club bag for Mrs. Shaw. Mr. Shaw made a brief and suitable response.

Licenses for Canadian Goods in Bond Through U. S. A.

The United States War Trade Board has passed a resolution authorizing the director of the Bureau of Exports to license freely cargoes originating in the United Kingdom, France, Italy, or their colonies, etc., when shipped via United States ports to United Kingdom, France, and Italy or their colonies, etc. Instructions are being issued by the Bureau of Exports to make this resolution effective. All shipments of the above nature "in transit" originating in Canada and passing through the United States by rail, in bond, will be forwarded by the collectors upon receipt from the shipper of an additional copy of the United States customs carriers' manifest form 7512. Similar arrangements are to be made in connection with cargoes shipped from Canada by a steamer which touches at a United States port. In such cases collectors are authorized to license the cargo upon receipt of a copy of the manifest covering it.

The United States Government, acting through the Department of Justice, has reached a compromise with the news print manufacturers, in accordance with which the maximum price of news print paper at the mills, bought in rolls in carload lots, is to be $3 a hundred pounds until the end of March, 1918, after which the maximum price will be determined by the Federal Trade Commission and subject to review by the three judges of the United States Circuit Court of District of New York. The latter maximum price is to prevail during the period of the war and for three months thereafter, unless altered by the commission and the court. Under the same agreement the News Print Manufacturers' Association is to be dissolved.

Securing the Interest of Architects

Working Up a Reputation for Doing Particularly Fine Work—The Architect's Influence Well Worthy of Cultivation

One of the subjects discussed occasionally by retailers and planing mill firms is the importance of getting into touch with architects and seeking to obtain their interest as well as to co-operate with them. It is pretty generally admitted that there is an important field here for improving business and that it is much neglected. G. D. Crain, Jr., in an article in the Woodworker, discussing this subject, deals with it as follows:

Every planing mill man has to do business with architects, and presumably knows the best method of handling this important factor; yet almost any manufacturer in this line will admit that he has had trouble solving the problem and getting into the right position with the men who decide what kind of trim to use in their buildings and what manufacturers to give the jobs to. A suggestion that perhaps planing mill operators are not going after this business in the best possible way was given recently in a letter received by an association of lumber manufacturers from an architect in an Eastern city.

"Will you please give me the names of some reliable planing mills," the letter ran, "that can furnish stairway materials, including treads, rails, balustrade, newels, etc., for a large residence job which I am working on? I want to use your wood, and I do not happen to know of a mill which is qualified to take care of work of this kind."

Now, there is no doubt about the architect knowing several planing mills, at least; and it may appear strange to the casual reader that he should have addressed this letter to an organization of sawmill men who are not supposed to know much about the manufacture of interior woodwork, inasmuch as that is not in their line. Why should the architect go to them for information, instead of turning with confidence to the people in that line?

The explanation could, of course, be made that this organization, formed for the promotion of the interests of a certain wood, was naturally interested in seeing that the architect got in touch with the right planing mill and got the material he needed for his building job. Because it was advertising its willingness to furnish information of all kinds pertaining to the use of this product the architect was encouraged to call on it for assistance in locating the right concern to furnish stairway material of this particular kind. That seems to answer the question, at least superficially.

But, getting right down to bed-rock, it would seem that the planing mill people in the locality of this architect should have been sufficiently alive to make it not only unnecessary, but absurd, for anyone to think of turning in some other direction for information about mill work, no matter what phase the enquiry might take. In other words, if the operators of the planing mills in that section had been handling the architects along constructive and positive lines, this member of the profession would have been satisfied of their ability to serve him, and would not have asked a disinterested party to indicate a manufacturer of sufficient knowledge and ability to take care of an exceptionally important job.

Showing the Architect One's Ability

Practically every other line producing materials used in building construction makes a point of getting the architect's interest in this way. The building hardware man suggests that the architect come around and look at the model room finished with his products. The brick man has an exhibit showing how different kinds of brick look, laid up in walls and treated with different colors and kinds of mortar. The electrical man doesn't stop with merely asking for chances to figure, but goes to the extent of offering suggestions about the kind of fixtures to use and technical data regarding the specifications covering the wiring. The plumbing concern has model bathrooms and other features showing the way to use its products effectively, and, in short, the architect gets suggestions from everybody who wants to be represented in the building—except the planing mill man.

Jobbers of doors and other mill work that is carried in stock and sold by number, of course, have samples on view, and these can be seen by the architect. But for special jobs, such as that referred to by the architect whose letter was quoted, there is no medium by means of which he can get the information he wants. He must rely on the professional knowledge of the planing mill man, so to speak, and if he has not had it impressed on him that any particular member of the trade knows his business from this standpoint he is at a loss as to how to proceed.

This may furnish the clew to the mental condition which led to the letter of enquiry being written. Nobody who had been soliciting this architect had impressed him as being up to the mark in this particular direction. They knew the mechanical end of the business, and were ready to follow instructions; but they were unable to anticipate these by offering suggestions which would have a bearing on the problems of the architect and would assist him in designing an interior which would reflect credit upon him and upon the manufacturer, and would please the owner because of its distinctive and substantial character.

The writer has known a good many planing mill men, and most of them are above the average in intelligence. They are good business men, and handle the operation of their plants successfully. Yet few of them have seen the possibilities of promoting their business by making themselves distinctive in this fashion. Hardly any even take the trouble to use some particularly fine job as a means of advertising their ability to do good work.

One planing mill man, who handled a contract for some exceedingly fine oak interiors in a public building, had photos of these made and sent out a few hundred postcards. He didn't know exactly who would be interested, so his mailing list was not made up with a great deal of care with reference to the possibility of getting business from those who might see the card and be impressed with the extent and character of the work. This doubtful effort at advertising is typical of the indifferent attitude of most owners of planing mills.

Then, too, the competitive idea is uppermost. The average member of this business is so used to figuring estimates that he pays more attention to this than to creative or constructive work. He assumes that whatever work is coming out will be figured on in his office, and doesn't attempt to go beyond this. He fails to realize that before the plans are drawn and the blueprints sent out is the time to make hay with the architect, especially if the latter is not posted regarding the details of woodworking and the possibilities of the treatment of wood interiors.

Young Architects Anxious for Help

Many young architects are exceedingly anxious to make use of co-operation of this kind. It is sometimes said that men in various lines occasionally write the specifications covering their specialties, the architects having found that they are technically qualified to indicate how the work should be done, whereas they themselves are not. And, of course, it is assumed that this gives the man who handles this feature the inside track in getting the business. Even if the specifications are written so that all have an even chance, the architect regards the contractor who has given him the benefit of his technical knowledge with good-will, and, other things being equal, he is going to give him the business, is possible.

There is nothing illegitimate in offering an architect assistance based on knowledge of a certain field. It is logical to assume that the planing mill man understands woods better than an architect may be expected to do, and that he is in position to make intelligent suggestions regarding the use of woodwork. But it remains a fact that most of those making the rounds of the architects' offices for planing mills are not doing much along this line, either because they lack the knowledge or because they do not understand the possibilities of effort of this kind.

"Anything for us to-day?" is the greeting of many a solicitor who is supposed to cover the architects for the planing mill concern. Or perhaps the owner of the plant does not even have the architects called on regularly, but waits until the plans are displayed at the builders' exchange, or until he is invited by the architect to figure on the detail with which he is prepared to deal.

The result of all this is that the architect comes to regard the manufacturer of woodwork for his interiors as artisans purely and simply. He does not turn to them when he wants suggestions or when he is trying to bring about an unusual and attractive effect by means of the proper selection, manufacture, and finish of his materials. Yet the man who is producing the trim is the logical person to give advice, because of his experience with woods and because of his knowledge of sources of supply, costs of production, etc.

A great deal of what has been said here could be made to apply to the owner as well as the architect; but, in view of the importance of the latter, especially on jobs involving considerable expenditures, and his ability to influence the decision of the owner with reference to the character of the building in all its details, he is the man who should be given most attention.

Here is a big field in which the planing mill operator can work. He may not be prepared at present to undertake anything of this sort. There may be no one in his organization who is big enough or qualified by the right kind of training to go into an architect's office and talk to him about the details of his professional work. Yet the concern which had such a representative would find him in demand, and archi-

tects would get in the habit of relying on his advice and judgment as to what they should do in the matter of their interiors.

All of this would surely make for more business, just as it would make for better business. The associations of lumbermen are doing a good work to educate the public, including architects, regarding the desirability of their products. However, it can be said, without discounting the value of their efforts, that each has an axe to grind. The planing mill man who buys the materials his customers want is disinterested, and can really and truly advise without holding back anything. Everybody's interest would be promoted by a little more aggressive attitude on his part.

Prize Steer Sold for Halifax Relief

A record price for live stock was paid recently by the Harris Abattoir Company, Ltd., Toronto, for the grand champion steer "Black George," which carried off the honors at the Guelph Winter Fair and Toronto Fat Stock Show. This splendid animal, weighing 1,360 pounds, was purchased by the company at the price of $1 per pound, or a total of $1,360. Immediately after the purchase, Mr. James Harris, president of the company, donated the steer to be sold and the proceeds devoted to a fund for the relief of Halifax sufferers.

An Attractive Blotter

The Consumers' Cordage Company, Ltd., Montreal, Toronto, Halifax, St. John, N.B., Winnipeg, Quebec, and Vancouver, are distributing to buyers of rope some very neat and attractive blotters. The celluloid cover is printed in brown and black, with the figure of a lion as the feature—the "Lion Brand" is the brand of the company. The blotters are issued in three varieties, the difference being in the illustrations of rope on the cover. Any rope user desiring blotters can obtain them by writing to the head office in Montreal or to any of the branches.

Hon. Jules Allard, Quebec Minister of Crown Lands and Forests, in his annual report to June 30 last, states that the revenue totalled $1,753,624, which is a very satisfactory result when account is taken of the difficulty of securing sufficient labor and means of transporting lumber. The chief items of the revenue are: Ground rents, $347,505; cutting rights, $1,115,892; penalties for infractions of regulations, $29,354; as well as various other small amounts.

The board of the Riordon Pulp and Paper Company, Montreal, have elected three new directors—Messrs. C. B. Thorne, manager of the Hawkesbury mill; F. B. Whittet, secretary-treasurer of the company, and T. E. Warren, manager of the Ticonderoga Pulp and Paper Company, a subsidiary of the Riordon Company.

Dairy Cattle Barns

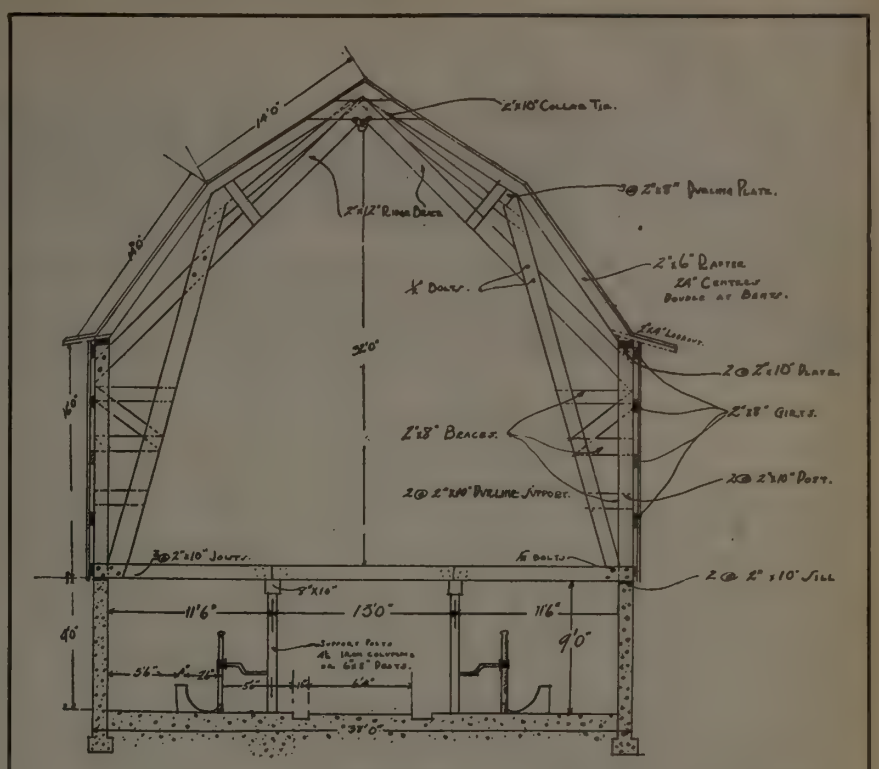
A bulletin (No. 253) on the subject of "Dairy Cattle" has been published by the Ontario Department of Agriculture. This bulletin contains, in addition to much valuable material in regard to cattle, an interesting discussion of cattle barns. Referring to the walls for the barns, the bulletin says:

"Where wood building material is available, or can be bought cheaply, this kind of wall is satisfactory, if the points are tight and windproof, and the frame of the barn is sufficiently strong to carry the maximum weight of barn and contents in all kinds of windstorms without twisting. Wooden walls are usually dry particularly if there is an air space in the wall and plenty of building paper is used. If the animals are pretty well crowded in a stable, ordinary walls, double-boarded, only on the outside of the studding, will keep in plenty of warmth except in our severest localities.

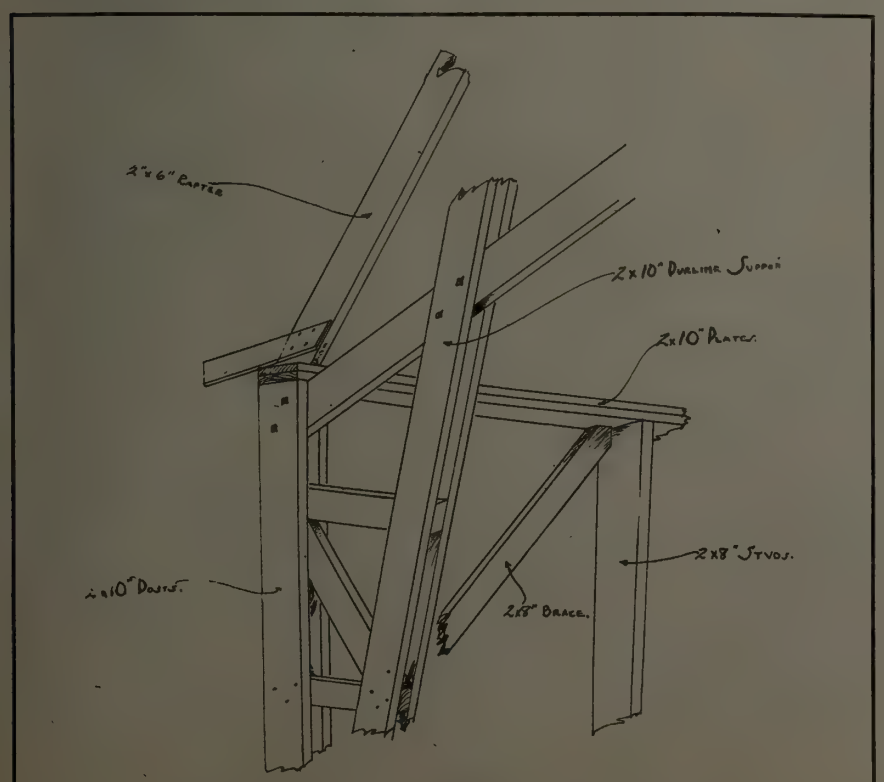
Referring to the framework of barns the bulletin says:

"The square timber frame of barns is giving place rapidly to plank frame construction, some details of which will be found in the illustrations. Brick and stone are now out of the question, in economical barn construction, on account of the high cost of material and labor of erecting."

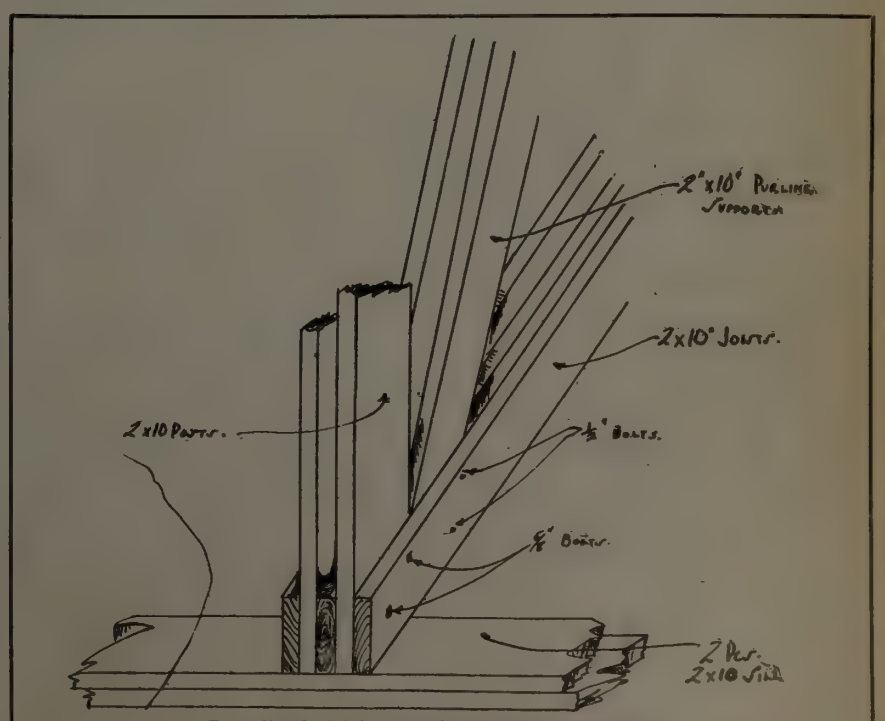
The bulletin also contains a number of illustrations and descriptions of the best methods of laying out the interior portions of cattle barns and descriptions of ventilating methods, much of which will be useful to retailers whose customers expect them to know how to plan and construct barn buildings.



Cross section of good plank frame barn. Bents are 12 to 14 feet apart. End bents have no ridge brace, but have 2 in. x 8 in. girts spiked crossways every 4 feet.



Detail at plate in plank frame construction.



Detail of sill in plank frame construction.

Logging Camp Sanitation

By Dr. W. N. Lipscomb, field representative of the American Red Cross*

The question of personal and community sanitation has always been a difficult one to enforce. The chief defects of the logging camps on the Pacific Coast are the result of indifference and ignorance on the part of managers and foremen, likewise the men, and the fact that most managers doubt whether the cost of improving a camp will yield dividends in the end. A great many men, as Herbert Kaufan says, are in the habit of looking forward to yesterday. Too many managers of logging camps are conducting them with a blind indifference to sanitation, which, put bluntly, simply means decent living. I do not think that intelligent men will deny that the present labor unrest in logging camps is due, to some extent, to living conditions; I realize that much is due to the ignorant being led by the vicious, but they should not be given this argument at least on which to base a campaign. After visiting the mining towns in Pennsylvania and looking over many settlements of other industrial enterprises, I will have to confess that I was rather amazed on going to Western Washington in 1915 and finding camp sanitary conditions as they were. I can repeat this after being a visitor in over 200 camps. I realize that a logging camp is merely a changing base of operation, and that too much expenditure cannot be made on a temporary abode. In commenting on the situation, you will realize that I am looking at it from a physician's standpoint, which I think should harmonize with that of a modern lumberman. Most of the recommendations here to be suggested will require a little more time on the part of the foreman in erecting a new camp, and of him and the men generally in keeping to a high standard. The average logging camp foreman needs a good deal of education along lines of sanitation, surgical emergencies, and handling men. His methods would not be sanctioned in many industries. The lumber industry is already too wasteful in men, money, and materials, and the Pacific Logging Congress could well adopt the following motto to counteract this: Intelligent standardization. It seems to me that a small committee, representing the congress, could, in conjunction with a physician having a complete knowledge of public health and sanitation, draft a set of standard rules to be followed by all. I realize that circumstances alter cases; that locations will have to be met perhaps in individual ways, but the plan as a whole seems feasible, and will obviate some of the difficulties in dealing with lumberjacks. One good thing about standardization, too, is that when this class of labor, obviously of a rapid, shifting type, finds out that one camp is about the same as another, I think it will have a tendency to hold the man longer in one place or else eliminate him from the woods entirely.

Every foreman should be instructed to use more judgment in the location of a camp. I recall one camp in Eastern Oregon, which is in a low, marshy place, the location being capable of improvement by moving the camp less than 200 yards, and it was not impossible to do this. Any camper who has had experience out of doors always pays attention to drainage in case of rain; any foreman constructing a camp should see to it that the proper drainage, especially from the cook-house and camp toilet, is secured.

The water supply of a camp is important, especially from the typhoid standpoint. I realize that most camps are supplied with water from springs and seepage pockets removed from same. A small amount of copper sulphate placed in this water every few days will make it safe. An excellent sand filter may be put in a spring by boarding up same and then placing a barrel or box well perforated, filling the intervening space with sand; the idea is to force the water through the sand, which makes a cheap and ideal filter. The water should be piped to the camp. It is well to remember that we have about 400,000 cases of typhoid in this country annually, about 10,000 cases being fatal, and an average time loss in each of from eight to ten weeks. I will admit the flies are more responsible for this than water, and both dangers should be eliminated. The water should be handled at point of delivery by hydrant system into barrels in the cook-house. The average cook does not protect these barrels sufficiently. I might mention here that logging managers generally should follow an army rule and insist that the cook be vaccinated against typhoid. A common drinking cup has been called a national disgrace because it is a carrier of syphilis and tuberculosis. My suggestion in regard to a drinking fountain for a camp is one more easily carried out where the hydrant system is used. Make a double elbow at the hydrant with a control faucet, the last few inches of the pipe protruding vertically. Men should be encouraged to use their own cups, and cheap cups should be for sale in camp commissaries. The man with the suspicious sore mouth should be referred to the contract surgeon. In suspicious localities—that is, near places where typhoid fever has been—bacteriologic tests should be made of the water. Almost any state board of health will assay samples. Another thing which makes this worth while is the estimation of the scale-forming content so far as locomotive and donkey boilers are concerned.

*Delivered before the Pacific Logging Congress.

Dispose of Waste

Solid garbage.—This can be given to hogs, which should be located not less than 200 feet from the cook-house and against direction of prevailing winds; it can be drained into a septic tank or pit, which should be covered to the extent of being fly-proof. Have it burned daily. If none of this is possible, have garbage cans made of zinc, with air-tight tops, which can be used for conveying a suitable distance from camp. I recall one camp where the cook created an open cesspool less than twenty feet from the kitchen. Such a cook as this should be replaced immediately.

Some camps are screened against flies as to cook-house; all should be. With some that are screened the camp carpenter has been careless, or the cook. Doors should be weighed so as to be self-closing, and should be fitted well into frame. This will apply also to the camp toilet. Lieut.-Col. Keefer, professor of military hygiene, outlines the five following methods of ridding the place of flies where screens are not effective or possible: "First, sticky fly-paper; second, saucers containing 1 per cent. formalin with a little sugar; third, arsenic paper in water; fourth, fly traps; fifth, Persian insect powder (pyrethrum), the burning of which produces fumes which stupefy the insect. These fall to the floor, and can be swept up and burned before they revive."

I have three criticisms of camp cooks—they are too friendly to the fly, use too much grease, and furnish too much heavy pastry. However, I will say that the food of the average logging camp is superior in quantity and quality to most other industrial concerns. In other words, the average logger is lucky to get the food he does for the price. Dr. Shields, whom many of you will recall, made a rather unique observation some time ago, namely, that if the "No Talking" signs were taken down the men would benefit as the result of slower eating. I think it a good rule to enforce that no cook should be allowed to eat or sleep in the kitchen, and that he be directly responsible to the camp foreman for the disposal of waste. Many superintendents will no doubt ignore this and resort to the old-fashioned policy "Let well enough alone." However, I think the average camp cook, though being an autocratic individual and resenting direct authority imposed, is very amenable to suggestions; such has been my experience. Some are difficult to deal with because they possess what I term the intolerance of ignorance.

The average camp toilet is a disgrace. It is too close to the bunkhouses, too much open to flies, and the location results in contamination of streams, and typhoid and intestinal diseases, often traceable to the fly as an intermediary agent between the toilet and the food. I know one industrial surgeon who has not had a case of typhoid infection among his men for several years, and he attributes it to the one simple fact that employers have co-operated with him in building fly-proof toilet. Contract surgeons are not and do not claim to be sanitary experts, but they will co-operate with you along this line.

Every man should carry his own towel. I quote from the report of the United States Public Health Service: "In regard to towels, there is no question but that the common towel is the obvious means of conveying infection, and should never be used in any industrial plant." The roller towel is a menace, and should not be used.

Bathing facilities can be installed at small cost and give general

satisfaction. A bathtub is expensive, and should not be used by a community group. The shower is the most feasible. One of the best arrangements that I have seen in any camp is that of Camp 7, Simpson Logging Company, Shelton, Washington. This is a car camp, and one car is assigned to this purpose. There is a heater in the middle, reconstructed from an old donkey boiler, with a steel rack around, on which to hang clothes. Along one side of the car is a section of about twelve hydrants for hand-washing and on the other about six deep basins for clothes. In the other end of the car are two showers in individual compartments. The president of this company and the foreman of the camp agree that such a system pays. The study of the relation of environment to the health and efficiency of the worker and the application of necessary remedial measures constitute sufficient industrial hygiene. I am not of the sentimental disposition which tries to mollycoddle a lumberjack, but I am suggesting these things purely from the standpoint of health, comfort, and increased satisfaction among your employees, three great factors of human efficiency. It has been demonstrated that if you can increase the self-respect and general well-being of a man you can double his output.

Living Quarters

The large bunkhouse is undesirable as a type. When a mass of men, say 35, are put under one roof, police regulation could hardly maintain hygiene. I know of one bunkhouse holding about 80 men, with a very small washing place therein, where several men acquired gonorrheal infection of the eyes from one man who had come into camp with a fresh infection. While such is unusual, the further possibilities would naturally be reduced by a small bunkhouse. Another point about this place was that the only ventilation afforded was by a door in the front and back. No wonder these men were dissatisfied. I believe that camp managers pay directly for this overcrowding in loss of efficiency, especially for the morning's work, because the men get up feeling groggy, often with a headache and a grouch, and the type of work they do looks to me more like scientific loafing. It is no wonder they feel this way, as at night they hang up their clothes, build a hot fire, close all the doors, and sleep under groundhog conditions. I know of one company, for instance, manufacturing a food product, who spent $42,000 in one year on lunch rooms, gymnasiums, night schools, and sanitation (these latter two are exceedingly worth while to institute in logging camp). It may be worth while, too, to note that at the end of the year this company showed an increased, rather than a decreased, dividend. It is an obvious fact, proved by hundreds of employers, notably in factories, that a man does more and better work when he is contented and happy than when listless and in half-way health. Of course, none will deny that vicious agitators have been to a large measure responsible for logging camp troubles on the coast. I do not think that it can be denied, further, that vicious living conditions are to some extent responsible. Better sanitation will recompense the employer in better work. It is difficult to make many men see this, because they will not take the trouble to observe what good results this has accomplished elsewhere. It is a poor employer who says that he does not care a whoop how men live just so they do their work. When he takes such a stand he is drawing on his own checking account. My observation, too, has been that men suffer more from colds and minor disabilities, which hinder efficient work, who live in these large bunkhouses than in the smaller ones. This loss of efficiency is aggravating to the man and financially destructive to production.

The small bunkhouse is, to my mind, ideal, and by that I mean four to eight men to a compartment. Many companies have already adopted this and seem better satisfied. I wish to quote from Keen's "Military Surgery":

"Experience has demonstrated that not less than 60 square feet of floor space and 600 cubic feet air space per man is essential to preserve the health of troops in squad rooms, but these figures are really lower than is consistent with safety. Medical authorities are of the opinion that the minimum floor space should be 70 square feet, air space 600 cubic feet, normal ceiling height 12 feet."

There are several methods of ventilating bunkhouses — place transoms over all doors of all rooms; provide good size openings above doors or windows at the end of the hall. Since a lumberjack likes to close these from habit, I would suggest a ventilator in the top of the building, essentially a roofed-over chimney which cannot be tampered with by any darn fool who wants to sleep like a prairie dog. If the bunkhouse or car is above a grating, place the stove so as to admit air from below. A slide cover could be made for this grating. The logger should be educated to the fact that night air is good instead of bad

A camp car is, to my mind, an excellent method of housing men, and, from my observation, has been the cleanest. It presents six sides to the air and is better ventilated. The United States army, with its method of sanitation in camp, furnishes a fine object lesson to any employer of labor who will take the trouble to investigate. In many places it is immaterial that bunkhouses be screened, but all cookhouses should be. Discussing the latter, I recall being a visitor to one camp which was blessed with so many flies that the casual observer could not tell the difference between custard and mince pie.

My observation is that foremen are very little interested in keeping a camp clean, and that the bull cook is inherently lazy. The latter should be required to scour the floor and air the bedding at least once a week, and the custom of keeping bunkhouses closed all day long should be abandoned. A great many people shed crocodile tears about the hardships of the soldiers. Perhaps this is true, but one fact remains that his living quarters are kept as clean as possible, and definite men are held responsible for this. There is a much debated question about furnishing employees bedding in camps. Personally, I am in favor of this. The steel bunk, too, is cleaner, more easily moved and disinfected, and, I believe, cheaper in the long run than the old-style wooden bunk, which is especially difficult to rid of vermin.

Supervision of Health

Not enough precaution is taken in regard to the health of the men in camps. More co-operation should exist between the operator and the contract surgeon. For instance, if one camp foreman had consulted his contract surgeon before placing a certain camp, his water supply would not have been an open stream within fifteen feet of the line of bunk cars. I do not believe that the man suffering from an active venereal disease should be hired. Here I realize I am placing a hardship upon employers, when labor is scarce, and one on the man who seeks work to live. Most of the men infected with this either allow it to become incurably chronic or spend all they make on patent medicines and ignorant quacks. The time is coming, and has come in a good many industries, when a physical examination of all employees will be an accepted fact. Experience in several industries to-day shows that workmen first objected strenuously to the medical examination, but now, after several years' trial, not only fail to resent, but invite it. This is simple preventive medicine. When men are scarce and hard to get; when they are untrained for anything else, it is a difficult thing to eliminate them because of this. Army medical officers, much as the army has always needed men, have always been inflexible in refusing such unfortunates. Personally, I think that a man should report for examination to the contract surgeon before reporting to the mill or camp foreman.

I wish to quote from a book on business efficiency:

"The duties of the employer to the employee have been enlarged in recent years, and are not merely those of the purchaser of the employee's time and service for money. The enlightened spirit of the age, based upon the experience of the past, has thrown upon employers other duties which involve a proper regard for the comfort, health, safety, and well-being of the employe, and unless it is shown to be wasteful of the company's money and unproductive of beneficial results, the practice may stand as well within the scope of its business."

This is an extract from a judgment of the Appellate Division of the Supreme Court of New York. I wish to quote further from this book:

"The new industrial philosophy is this: 'Nothing is so valuable economically as a man. To injure or to kill him is to destroy the one essential in the scheme of world-wide civilization and prosperity. He can produce at the top of his bent; can consume equally. Injury and death are the fruits of ignorance, recklessness, and greed. A death toll is no part of a well-managed industry. It is wasteful, wantonly wasteful. The saving of life thus becomes an industrial issue.'"

I realize that it means some expense and individual trouble to enforce sanitary rules among a group of men who are, for the most part, ignorant and fatalistic, but I believe it exceedingly worth while. In a highly competitive world of high prices, labor troubles, individual inefficiency and bad health should be obviated by all means, as they add too much to the cost of an already high overhead expense. The principles that I have laid out are not difficult to carry out, and in time will yield results. There is too great a disposition on the part of logging managers to discount any innovation, especially one not introduced by a member of their occupation. Decent sanitation, implying decent living, is an industrial asset, not an idealistic dream. I wish to reiterate my suggestion that a committee of sanitation standards in camps be elected or appointed, to include some physician well up in sanitation and to co-operate with the various boards of health. This committee must be able to see with a clear eye, not blinded by the indifferent, careless methods of dealing with men which have largely characterized individual performances in the past. This committee should receive the whole-souled co-operation of every logging company.

A report from Powell River, B.C., states that all the shingle bolt and logging camps on Powell Lake have been working with full crews, making every effort to get as much stock cut as possible before the arrival of snow.

How to Hold an Efficient Labor Force

Elements of Personal Relation Between Employer and Employee That Regulate the Profitableness of the Labor Output

By Frank H. Lamb*

The attention given to the problem of securing and keeping an efficient labor force has not been in keeping with that devoted to the other details of business management, nor has it been commensurate with the cost of labor involved. This has often been due, doubtless, to the development of most operations from a small beginning, in which the owner or manager was able personally to select his co-workers from men long known to him, and whose ability he has ascertained often by working side by side with them.

A railroad president and a public service commission valuation expert were discussing the valuation of the railroad properties just made by the commission. The president pointed out the fact that the commission experts had entirely omitted one of the most valuable assets of the company. Surprised, the expert asked what it could be. "Our labor organization," responded the president. "It has taken us years of effort to build up this body of workers. They are an asset worth millions to this road." The labor troubles in the logging industry during the past few months should convince the logging operator that labor is the most important element in a successful operation, and that good management should include a study of labor problems.

The great trouble with most labor efforts has been that they are disjointed, casual measures, undertaken often in a spirit of corporate pride, and without any relation to the basic principles underlying the problem. After every disturbance the employer launches some scheme of patriotism, for instance, that in most cases is only a play to the galleries, and forgotten as soon as men become a little more plentiful or satisfied. Another company, inspired by a desire to do something big, goes into elaborate welfare work, without any consideration of or correlation with, basic labor principles, with the result that the undertaking is a failure, and one more instance of the ingratitude of the working man is heralded forth.

What are some of the basic principles in labor maintenance and how are they to be applied to the labor problem of the logging industry? First, labor is human, not a machine, and the measure of a successful operation is the combined produce of a low cost for labor per unit of output and a low ratio of labor turnover. Low labor cost per unit of output of itself is not always desirable if, for instance, it is accompanied by evidences of a constant shifting of workers, since to build a labor organization on a stable, sound basis there must be some continuity to the labor force. To judge labor results entirely on the basis of per unit cost is to sink labor to the level of a machine. Labor, possessing a mind and soul, its service is not rendered entirely in any one day's work. There is loyalty to the employer and the opportunity of serving him by the exercise of a mentality that is often worth more than the actual manual services.

A machine that performs a certain operation at the least total cost is the superior machine for that operation. The great trouble with most of our labor plans has been that we have judged labor on the same basis. For example, I have heard large logging operators declare they would not employ any more married men than necessary, because the liability, in case of accidents, was greater. Because of the passage of the workmen's compensation law this objection no longer exists. Still, only during the past few months have most of our employers been able to see the advantage of having a labor force comprised largely of married men, who, from the fact of being married, are necessarily more settled, more loyal, and more conservative.

A constantly shifting labor force, no matter how efficient it may other wise be, leads to disorganization and loss of effort. A machine calls for only a mechanical co-ordination of appliances. The efficient work of any workman, and particularly is this true of logging, calls for a high order of team work. The best football team is seldom made up of stars. It is one with the best developed team work. It is absolutely impossible to develop an efficient labor organization with a labor turnover of 20 or 30 per cent. per month. Even 10 per cent. is suicidal.

Itinerant Labor

The young, active man, unburdened with family and with physical forces unimpaired through long struggles to maintain a family, may often be a stronger and harder worker. Too often he is a member of the great army of itinerant labor. Working in the woods in winter when other jobs are scarce, and with spring seeking the construction camp or harvest fields, satisfied only for a few weeks at a time with any one job, he shifts across the face of the country, receiving good wages when at work, but spending all his earnings in finding the next job. Itinerant, or casual, labor is a necessity with our system as it now exists, but it is an evil which, bred in necessity, grows through force of habit until the workman is incapable of staying steadily in any one position, no matter what the opportunities or the pay.

In the terms of the cost-keeper, it is immaterial what the nationality of a workman may be, but the labor economist has long recognized the principle that men who are citizens of the country, interested in its well-being contributing through taxation to its upkeep and who have the intelligence to make use of its institutions, are preferable to large bodies of aliens who, through long centuries of oppressive legislation and lack of educational facilities, are unable to appreciate free institutions and mistake liberty for license. The Americanization of workmen is something that needs more than a flag-raising and a declaration of intention that is only borne of necessity. It means personal study of men, the constsant endeavor to show them the advantages of citizenship, the opportunity to learn the language, the customs, and laws of the nation. This can be done most effectively by throwing them with American men in their daily work. The labor force that is made up predominantly of any alien nationality is a menace to the employer and a greater menace to the country. Such bodies of men retain their own language, customs, and prejudices. The only thing they absorb from the outside is the teaching of the agitator and labor exploiter.

The religious, political, or economical principles of the workman is of little moment to the cost-keeper. To the wise employer, however, these mental characteristics are all-important. The employer expects not only efficient physical service, but also the exercise of judgment and intelligence in his behalf. The state of mind that breeds sabotage and syndicalism is readily recognized as dangerous, but few employers take the pains to ascertain if the disposition and principles of the workman would at all times allow full co-operation and a willingness to use his mind as well as his body for the benefit of his employer. More rarely does he reward the exercise of judgment and intelligent co-operation when it is given.

Secondly—Under our constitution and laws all men are equal. Any negotiation between freemen must be as between equals. The workingman wants to be treated as the equal of the representatives of capital in all matters. Lack of comprehension of this basis of equality is responsible for the failure of most of the welfare work attempted by many corporations. Elaborate plans are conceived and carried out on a basis of the dependency of labor on capital. The benefits sought to be bestowed are forced upon the worker from above, and are not evolved through co-operation. Instead of securing the advice and approval of those it is planned to benefit, the bestowal becomes one of forced charity, the interest of the worker is antagonized, and, of course, the undertaking is a failure.

Developing the Workman's Pride in His Task

Thirdly—The opinions of the worker are formed as a composite from the information he receives from various sources. The actual results of the conduct of most businesses is to him a closed book. What he is told is so often belied by surface indications that he gradually comes to believes nothing from the employer. Employers meet and howl lustily over the fact that their particular business is in a bad way and they are facing instant ruin. The next moment they whirl away in the latest model motor car and envelop in a swirl of dust some worker on whose judgment the safety of thousands of dollars of equipment depends. No mention is ever made of the times when profits are normal or better for fear that the worker will ask for more wages. As a result, the worker hears only calamity howls and, remembering when the owner only a few years before had about as much as he has now, he puts his employer down as a constant liar and listens unto the agitator, who is likewise a liar, all the more fervently.

The self-respecting workman wants to work for the successful concern. There is pride in serving the successful. The large corporations, such as the railroads, the Standard Oil, and United States Steel Corporation, are more successful in maintaining an efficient labor force because their businesses are successful and because the figures as to their profits are known by all who want to look them up. Secrecy begets inflated ideas, particularly as to profits, and profits that look like piracy when unexplained would be a matter of course if the employer sought to explain to the workmen more of the financial side of his business.

In close corporations full publicity is perhaps not desirable, but a closer contact between the management and the foremen and more responsible men would circulate largely throughout the entire force

*An address delivered before the Pacific Logging Congress.

and correct much misunderstanding. This can be done in foremen conferences, or better, when possible, by having the stock of the corporation held by the workmen as generally as possible. This is the underlying basis of the stock distribution plan of the United States Steel Corporation.

Fourthly—In the compensation of the workman the tendency under the expanding growth of business from the small to the large operation and the tendency of all labor wage endeavors is toward a fixed price for the particular position or job. This tendency of minimum wages fixed at a point as high as possible results in the fixed wage being the minimum. The workman who cannot earn the wage is either tolerated when labor is scarce, and his more efficient fellow-workman makes up what he does not earn, or he is discharged and another man given the job. If fidelity, intelligence, loyalty to employer and length of service are considerations as well as low cost per unit of product, the single wage standard is wrong. Under its operation the new man on the job, who may work a day or a week and whose principles are not averse to sabotage or syndicalism, is paid as much as the man who has been on the job for years, and who perhaps not physically able to do as much work as the other, can, however, be relied upon in emergencies to stay with his employer and to serve him faithfully and intelligently on all occasions.

How best to correct this injustice under present conditions is a big question, and I will leave it by enunciating the principle that there will never be a just system of wages until the wage scale is made out on the basis of the minimum wage for the minimum output and greater output, fidelity, length of service, and superior intelligence is rewarded over and above the minimum scale.

Square Dealing Most Important

Fifthly—The old truism that justice is the best policy applies with particular emphasis to the conduct of labor management. Absolute justice must govern in all labor considerations. In order that the worker may recognize justness sometimes the employer must be more than just. There are so many and varied relations that it is impossible to define what is just. It is a human relation incapable of definition in commercial or legal terms. The measure of justice is the satisfaction of the parties involved. If it is a matter of retention of a position, length of service, and fidelity to employer must count more than a strong back and a weak or unsound head. Few employees will deliberately seek to ruin a business through wage exactions if they feel they are being treated justly. Under the old custom of personal supervision the honest employer was often a determining factor in seeking employment; under the impersonal methods and managements of the larger corporations justice is replaced by rules and regulations. Since labor is human, however, justice demands that each case be treated on its merits.

Space is lacking for the application of these five principles in labor maintenance to every phase of labor management. Suffice it to say that they should be governing principles in hiring labor in order to secure a proper labor force. If applied, the workers employed would be efficient to a reasonable degree; they would be men of substance and character, preferably men with family and influence. They would be largely American citizens, because they would be more in sympathy with the institutions and laws of the nation. They would be men who could be trusted in emergencies.

In maintaining such an organization the management would gauge its wage scale on the basis of what it could economically pay and not how little it needs pay. Its wage schedule would be a minimum scale, and long, faithful service and dependability would be rewarded by an increase over the scale.

Whether to provide for these increases by a bonus system, stock distribution, or cash dividends is a matter that must be decided for each operation after a full investigation.

In its living conditions the employer should constantly seek to improve conditions as fast as the employee is ready to utilize such improvements. It should, however, initiate such betterments through co-operation with the workers and not force its measures arbitrarily upon them. Logging operations being of a temporary nature, offer a difficult field to the installation of model living quarters. The old-style camp, with its crowding, lack of proper ventilation, darkness, poor heating, and personally supplied bedding of varying degrees of thickness and filth, is a relic of the age when labor was not particular.

Good Camp Quarters a Great Help

The more modern car camps were a great improvement, in that they were more sanitary and provided with some modern conveniences, such as springs, mattresses, dry rooms, lights, and baths. Their chief objection is the overcrowding. A standard pattern car allows only 40 square feet of floor space per man, a space only six feet by a little over six feet. This is not sufficient with 16 to 20 men in a single car. The ideal camp is the central semi-permanent village, with married men living in cottages with attached gardens, the single men in quarters where each man could have a room with bedding and linen furnished and kept in good condition, and a central dining-room. For the transportation of the men to work a light steam or gasoline locomotive and trailers could be employed, and the cost would be quickly absorbed in additional efficiency, greater satisfaction, and the opportunity of selecting your labor instead of taking what offered.

In strictly welfare work the principles enumerated are essential to success. There must be no paternalism. It is offensive and spells failure at once. It is for this reason that the Y.M.C.A. is so successful in carrying on this line of work. They work with the men and not over them. They secure their co-operation and make them pay part of the bills. They treat the men as equal human beings and not as objects of charity.

In an analysis of the results of several manufacturing plants the managers of two that showed the greatest efficiency claimed their results were due to two diametrically opposite methods of management. So in labor maintenance there is no blazed trail plainly marked for everyone to follow. The human element and local conditions call for different treatment in nearly every case. Elaborate efforts are failures in one case while an apparent lack of any effort is equally as successful in another. Analyze any of these cases and you will find the failures due to disregard of one or more of the basic principles I have enumerated and the successful concerns unconsciously operating under a plan that recognizes most of the five principles.

Let us, therefore, reiterate the five basic principles for clearness' sake. First: Labor is human, not a machine, and the measure of successful labor maintenance is low cost per unit of output plus labor turnover. The product is contentment, satisfaction, and loyalty of employees. Second: The workman is the equal of the employer and expects to be treated as such. There should be less patriotism and more brotherhood. Third: Labor as a co-worker is entitled to correct information regarding business generally; unless this is supplied by the employer and in such a way that its truth is self-evident, he is the prey of the designing demagogue. Fourth: To receive faithful, continuous service and individual loyalty the rewards for labor must be based upon a system of merit and not simply a single wage standard. Fifth: Justice must govern all labor adjustments. The worker who does not absolutely trust his employer to do the just thing under all circumstances will lack the esprit de corps necessary in successful labor maintenance.

New Canadian Manager for S. F. Bowser & Co., Inc.

Mr. L. P. Murray, former Mid-western manager of S. F. Bowser & Co., Inc., manufacturers of oil tanks, pumps, and storage systems, has been appointed to the position of Canadian manager. The advancement gives Mr. Murray jurisdiction over the Canadian office, factory, and sales force. As manager of the Chicago district office and as Mid-western manager, Mr. Murray has more than proved his fitness for his new position. Since the death of Mr. W. R. Hance, the Canadian plant has been ably directed by Mr. Harry Christie, who will now give the greater part of his attention to taking charge of the Canadian sales organization. With two such experienced men in Canada the continued success of the Canadian branch is assured.

Assistant Editor

for the

"Canada Lumberman"

The publishers of this paper desire to engage an Assistant Editor—a man who knows the lumber business and has some literary ability. Must be energetic, with keen interest in his work, suggest and carry out improvements, and assume responsibility. Whole time required. Opportunities for the right man. Apply personally or by letter to

The Manager,
"Canada Lumberman & Woodworker,'
347 Adelaide Street West, Toronto

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) $2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted—Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Wanted

Large size Elm Logs wanted. Address P. O. Box 5, Papineauville, Que. 21-2

Wanted—Lumber

Slabs and Edgings—Hardwood and softwood; five to five hundred cars, for cash. Box No. 641, Canada Lumberman, Toronto. 21-24

For Sale—Lumber

FOR SALE—Ten cars Heavy White Oak Ship Timbers for immediate delivery. Apply

Georgian Bay Shipbuilding Co.,
22-1 Midland, Ont.

For Sale

Five cars of Bird's Eye Maple in Logs, suitable for veneer or sawed to order.

Quebec Lumber Supply & Export Co.,
55 St. Francois Xavier Street,
24 Montreal, Que.

Ties and Shingles For Sale

15,000 Spruce Ties.
15,000 Cedar and Hemlock Ties.
A few cars of cedar shingles.

ST. LAWRENCE LUMBER CO.,
81 St. Peter St.,
24 Quebec, Que.

Lumber For Sale

Two cars 4 x 4 Maple Boxed Hearts.
One car 5 x 5 Maple Boxed Hearts.
One car 6 x 6 Maple Boxed Hearts.
Seven cars Fir Doors.
Three cars Fir Columns.

GEO. C. GOODFELLOW,
23-23 Montreal, Que.

For Sale—Machinery

Steel Rails For Sale

A small quantity of 20 lb. light re-laying rails, for sale for immediate delivery. Apply Box 651, Canada Lumberman, Toronto. 23-24

For Sale

Complete set Heading machinery. Can be seen running.

REID BROS.,
24-t.f. Bothwell, Ont.

FOR SALE—5/8 in., 3/4 in., 7/8 in. diam. wire rope, in lengths from 50 to 200 ft., suitable for guying purposes or for making booms, 4c per foot net in any size or quantity.

H. W. PETRIE, LIMITED,
22-1 Toronto, Ont.

For Sale

Very fine 18 in. and 32 in. x 42 in. Cross Compound "Brown" Engine, approximately 400 h.p., built by Polson Iron Works. Has 44 in. x 16 ft. Belt Pulley. Splendid condition. Immediate delivery. Box 654, Canada Lumberman, Toronto. 24-t.f.

Machinery For Sale

75 h.p. also 100 h.p. engine, heavy log jack and chain, Hamilton 3 block carriage, saw frame, 4 saw trimmer, Berlin No. 94 Planer, 12-in. 4 side Sticker, 30-in. bracket saw, shaper, automatic saw sharpener, Murray lath bolter, Rogers lath machine. Good condition.

VIGARS-SHEAR LUMBER CO.,
24-3 Port Arthur, Ont.

Planing Mill Machinery For Sale

Only in use for 18 months and almost as good as new.
1 Q. Y. Matcher, Gourlay.
1 Butting Saw, Gourlay.
1 Rip Saw, Gourlay.
1 Sticker, Ballantyne.
1 Scroll Saw, Ballantyne.
1 Surface Planer, Gourlay.
1 Heavy Band Resaw, Cowan.
1 Emery Grinder.
1 Large Fan, McEchran.
1 40 H.P. Westinghouse Electric Motor.
Saws, knives, dressing heads, etc., etc.

OTTAWA LUMBER COMPANY,
22 Metcalfe Street,
22-1 Ottawa, Ont.

Wanted—Machinery

Wanted—Circular Slab Resaw, second hand, in good condition.

York & Sunbury Milling Co., Ltd.,
23-2 Fredericton, N.B.

Wanted

Second-hand Inserted Tooth Saw about fifty-six inches, and three head block carriage.

DAVID EIDL,
24-1 Mildmay, Ont.

Refuse Burner Wanted

Second-hand Refuse Burner in good condition, 12 to 15 feet in diameter, and moderate height. Address with full particulars and price.

REAMSBOTTOM & EDWARDS,
20-21-22 Connaught Station, Ontario.

We are in the market for the following second-hand equipment: Power plant for fifty-foot, shoal draft tug boat; double engines preferred; one slab resaw; one double saw, automatic feed; tie mill. Address with full particulars and price,

Reamsbottom & Edwards,
22-1 Connaught Station, Ont.

Wanted to Purchase

One Steam Feed.
One Jumbo Edger.
One Nigger Canter.
Write all particulars to the

PIERCE JACOBS LUMBER CO.,
24 Timmins, Ont.

Wanted—Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Thoroughly competent lumber salesman is open for position with good firm on road or in office. Box 650, Canada Lumberman, Toronto. 23-24

YOUNG MAN, six years' experience as stenographer and bookkeeper in lumber business, desires change. Best of references. Box 629, Canada Lumberman, Toronto, Ont. 19-2

LADY STENOGRAPHER, experienced in lumber business, desires position in Toronto with opportunity of advancement. Four years' High School education. Good references. Box 653, Canada Lumberman, Toronto. 24

Position wanted by man of experience in both wholesale and retail lumber trade. Well acquainted also with the travelling end of the work. Available at once. Can furnish excellent recommendations. Apply Box 642, Canada Lumberman, Toronto, Ont. 22-1

Wanted—Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

First class bookkeeper for lumber and planing mill business. Young married man with thorough knowledge. Commencing at New Year's. State salary and give experience. Box 652, Canada Lumberman, Toronto, Ont. 23-1

Business Chances

For Sale

2,000 acres well timbered bush in township of Sinclair, new mill, stable and camps, Loading point, Huntsville. Reason for selling, ill-health. Apply to

HOLINSHEAD & ROGERS,
21-24 Huntsville, Ont.

Tide-Water Stumpage For Sale or Exchange

For sale, or will exchange for good ranch or farm land, B. C. Tide-water stumpage, cruised and surveyed.

CARL BLOCK,
19-t.f. Peoria, Illinois.

Mill Plant and Limits For Sale

43 Miles Limits on 31 Mile Lake, Gatineau Valley, containing Basswood, Spruce, Fir, Pine, Cedar, Birch, Maple and Pulpwood.

New Waterous 8 ft. Improved Double Cut Band Mill complete. Steam Alligator, Boats, Sleighs, Wagons, Harness, etc. For further particulars apply to

A. W. STEVENSON,
P. O. Box 2624,
8-t.f. Montreal, Que.

For Sale

About five or six tons of 3/4 and 9/16 tested chain in lengths from 27 ft. to 30 ft. with ring on one end and hook on the other end. Address Drawer "F," Sarnia, Ont. 19-t.f.

FOR SALE as a Going Concern Saw Mill and One Hundred Square Miles Crown Lands

Mill capable of sawing eight million superficial feet per year. New boilers, good engine and pumps, gang and rotary shingle and lath machines and planer. Railway siding in yard, also water shipping.

This property is situated in a thriving centre where labor is available. Good general store, boarding house and other buildings in connection with property. Good reasons given for selling.

No one need apply except bona fide purchasers.

Apply, Lumber, Box 648, Canada Lumberman and Woodworker, Toronto, Ont. 22-t.f.

TENDERS for Pulpwood Limit

Tenders will be received by the undersigned up to and including the seventeenth day of December next for the right to cut pulpwood and pine timber on a certain area situate in the vicinity of the Kapuskasing River in the Districts of Timiskaming and Algoma.

Tenderers are to offer a flat rate per cord for all classes of pulpwood, whether spruce or other woods. The successful tenderer shall be required to pay for the Red and White Pine on the limit a flat rate of $10 per thousand feet board measure.

The successful tenderer shall also be required to erect a mill or mills on or near the territory, and to manufacture the wood into pulp and paper in the Province of Ontario, in accordance with the terms and conditions of sale which can be had on application to the Department.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario, for Twenty-five Thousand Dollars ($25,000.00), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said Twenty-five Thousand Dollars ($25,000.00) will be held by the Department until such time as the terms and conditions of the agreement to be entered into have been complied with and the said mills erected, equipped and in operation. The said sum may then be applied in such amounts and at such times as the Minister of Lands, Forests and Mines may direct in payment of accounts for dues or for any other obligation due the Crown until the whole sum has been applied.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.
Toronto, September 19th, 1917.

N.B.—No unauthorized publication of this notice will be paid for. 20-24

Jobbers Wanted

We wish to let several contracts to take out logs on Berth No. 6, being broken front lying between the Magnetawan and French Rivers. This berth is all convenient to Canadian Northern Railway.

John Harrison & Sons Company, Limited,
Saw and Planing Mills,
9-t.f. Owen Sound, Ont.

Hoo-Hoo Wants Soldiers' Names

The names and addresses of lumbermen who have joined the ranks of either the American or Canadian army or navy are wanted by E. D. Tennant, secretary Concatenated Order of Hoo-Hoo, St. Louis, Mo. With the assistance of the trade press and lumbermen everywhere, the Order of Hoo-Hoo has undertaken to raise a fund for supplying comforts to lumbermen who are fighting for their country. Excellent progress is being made in the raising of this fund, and it is desired to place upon the roll of honor the name of every lumberman who has joined the army or navy of either Canada or the United States. Mr. Tennant says: "I have talked with a number of lumbermen who have already done their bit in the trenches. They say the men need tobacco, papers, magazines, and letters, as well as numerous comforts. While many hear regularly from relatives, others do not, and at times become very despondent; but when they hear from home, no matter in what form, it helps to make them realize that their efforts are appreciated. In fact, a Canadian officer told me his men were always ready for the hardest tasks after hearing from home or receiving home papers and comforts."

Barbados Lumber Market

A despatch from Barbados, under date of Nov. 14, says:

Stocks of lumber are low, particularly in spruce and white pine, the latter being practically out of supply. During the year the lumber trade has been quite up to the average of other years. The lumber has been coming down by schooner as formerly, small lots, however, by the Royal Mail. Freight rates are now quoted at $12 per M., as against $6 and $7 two years ago. Owing to the number of factories erected and increased building operations throughout the year, the demand for lumber has been brisk, though prices have been excessive. At present there are openings for consignments. If any Canadian firm is in position to consign lumber to this market, it would undoubtedly bring a high price, either spruce or white pine, particularly the latter. Ordinary spruce lumber is now selling at $50 per M., and white pine about $55 to $60.

Specifications for U. S. Packing Boxes

Standard specifications for packing boxes for the army have been promulgated by the United States War Department. The specifications go into complete details regarding the kinds, sizes, grades, and thicknesses of lumber to be used, the styles of boxes required, and the number of cleats and nails necessary to give the desired strength. For purposes of manufacture the principal woods used for boxes are classified in four groups, as follows:

Group 1.—White pine, Norway pine, aspen, spruce, Western yellow pine, cottonwood, yellow poplar, balsam fir, chestnut, sugar pine, basswood, cypress, willow, noble fir, magnolia, white fir, buckeye, cedar, redwood, butternut, cucumber, alpine fir, and lodgepole pine.

Group 2. — Southern yellow pine, hemlock, Virginia and Carolina pine, Douglas fir, larch.

Group 3.—White elm, red gum, sycamore, pumpkin ash, black ash, black gum, tupelo, maple, soft or silver.

Group 4 — Hard maple, beech, oak, hackaberry birch, rock elm, and white ash.

The thickness of the lumber to be used in making boxes and the length of the nails is varied according to these lumber groupings, in order that every advantage may be taken of the natural strength of the particular kind of timber used.

Your New Saw Mill

Will give you the best service and the longest service with the least expense for upkeep—If it is a Fisher & Davis Mill.

Review of Current Trade Conditions

Ontario

The car situation still dominates the Ontario Lumber trade. The situation is quite serious, and is holding up the trade in all quarters. Were it not for this there would be an exceptionally good volume of trade. A number of Ontario wholesalers have found it necessary to take their men off the road. The demand in general is far better than the supply, and prices are strong. Wholesalers report that they are taking stock right up to the saw. Good lumber is very scarce and strong in price. Nos. 1 and 2 culls in all lines are in strong demand. Lath are moving very slowly, although spruce lath in the last week or ten days have stiffened up about 15 to 25 cents a thousand.

Stocks of lumber in wholesalers' hands are much depleted. Probably the average holdings of wholesalers to-day would not amount to more than 50 per cent. of those of a year ago. Retailers' stocks are probably only about 25 per cent. of what they were at this time last year. Most of the trade to-day is with munition plants. There is no building trade worth mentioning.

The export demand from Great Britain is good, but it is almost impossible to make shipment across the Atlantic. The trade with the United States is good. but would be much better if it were not for the scarcity of foreign freight cars. Most of the stock going to the United States is for government business. There is a fair trade with the West Indies and South America, but the catastrophe at Hailfax will hurt this trade for a time, as Halifax was the only available port for shipments to these markets. It is almost impossible to get into New York, Boston, or Philadelphia for shipments to South America or the West Indies, as the railroad embargoes are preventing shipments. It is possible that arrangements will be made by some of the shipping companies to use the port of Portland, Me., for this purpose.

A tendency towards higher prices is reported from Ottawa, several lines having advanced from $1 to $4 per thousand, early in December. Retail trade at Ottawa is fairly good and somewhat more active than it was a year ago. All the Ottawa district sawmills have closed for the season. The transportation difficulties continue, it being almost impossible to obtain cars for shipment to the United States. New orders for powder boxes have been issued by the Imperial Munitions Board. These are the first orders of this nature since last spring. It is reported that woods operators who come in class A under the Military Service Act are to be given exemption for a period of three months.

Eastern Canada

The beginning of the winter season finds most of the mills in New Brunswick with a fairly large quantity of stock on hand, most of which has been sold but not delivered. Many of the large mills which sold to the British Admiralty have piled their stock back from the regular piling grounds, and so will not be handicapped by want of piling space for next year's new stock. The Admiralty, however, are making good progress in removing stocks which they have purchased, and it is not likely that there will be much of this class of goods left at the mills at the end of the winter. New Brunswick manufacturers are still doing only a very light trade with the United States, on account of the difficulty in obtaining cars. Canadian railways are not permitting their cars to carry lumber across the line, and United States railways are refusing to send their cars into Canada, so that the rail shipments to the United States have been greatly reduced. The absence of vessels for coasting trade has been an additional factor in the decrease of trade with the United States. Woods operations in New Brunswick this year will be considerably below normal. The larger mills are only taking out about one-half of a normal cut. Some of the large mills and many of the small ones are taking out nothing at all.

The local trade at Montreal is very quiet. There is a fair volume of orders from the United States, particularly for shell box lumber, but the great scarcity of cars is hampering the shipment of stock for this trade. Orders for shipbuilding timbers are very quiet, nearly all of the stock of this type required at present having already been ordered. The export season to the United Kingdom has come to a close, and the year's total was in the neighborhood of 20,000,000 feet, which is only about 20 per cent. of the total for 1916.

The spruce market at Boston continues firm and prices are strong. The demand is good in nearly all lines, and stocks are decreasing. The price of frames is very firm, but the demand for spruce clapboards is light. Sales of dimension spruce have not been very heavy during the past fortnight. The $40 base on dimension continues steady. Shipments from New Brunswick mills have been a little better, as cars have been more plentiful. There is not much prospect in the way of improvement in housebuilding. Hemlock boards continue firm at Boston. The shingle market is very quiet, and the drop in red cedar extra clears is reported.

Great Britain

The most important matter under discussion among the lumber trade in Great Britain at present continues to be the import situation. Merchants declare that they cannot see how this trade can be carried on under present conditions at a profit to importers, and that, as wood will be brought in either by the government or by private firms there must be some way in which private business should be feasible. At present they are entirely in the dark as to whether the government intends during the coming winter and throughout next season to do all the importing itself and to make its own terms with the foreign shippers or to allow a share of the business to pass through the old channels. If the former conditions prevails the situation will be serious to the trade. If, on the other hand, the comptroller really desires to keep the trade alive, he must see the ruin which is facing the old, established firms. The situation has, indeed, become one of life and death to practically every large and small lumber importing firm in Great Britain.

The trade in softwoods at London continues very slack. There is the usual large quantity of business in government requirements, which are filled to a certain extent from imported stocks, but to a much greater extent from native-grown timber. To counterbalance the deliveries from stock the arrivals have not been at all adequate.

At Liverpool there has been no change of late in the wood markets, and there is practically nothing to report. Shortage of freight space is restraining imports from North America. Until some better arrangement is made by the timber comptroller for an increased and steady supply of hardwoods from the United States and Canada, no relief to the stagnation in trade can be expected. Private trade is still suffering from the lack of supplies and from extensive selling restrictions, and there is no immediate improvement in view. Canadian spruce shippers are reported to be making offers of f.o.b. terms, but the difficulty in obtaining freight space prevents any extensive dealings in future deliveries. It is expected that spruce prices will advance considerably before next spring. Buyers, however, look upon f.o.b. purchases as more or less of a speculative nature under present conditions.

The trade at Manchester is also very quiet. Spot business is light, although there are plenty of enquiries for softwoods. Stocks of spruce are being depleted rapidly, and will probably be cleared up entirely before the end of the year. It is expected that next year will see a marked increase in f.o.b. values, both for spruce and pine deals.

United States

The chief points of interest in connection with United States trade during the past fortnight have been the increasing quantity of government business and a greater volume of ordinary trade than usual. Government control of business is still on the increase, and is likely to continue to increase throughout most of the winter. There is an improvement in the retail trade in districts where good crops have been harvested. In many sections of the United States collections are reported to be satisfactory. There is scarcely a factory anywhere in the country which can be used for the production of war supplies of any description that is not running full force. The market for Southern pine is very active, and orders are being placed considerably in excess of shipments or production. The car shortage is a great drawback in connection with all business that has not to do with the war. Retailers who did not lay in stocks earlier in the year are coming out with a good demand now, and are finding it very difficult to get deliveries. Most of the trade of this nature is from country yards, which report quite an increase in the volume of purchasing by farmers. In the corn-producing section of the country farmers did not appear in the market as early as usual, and then they wanted practically everything that was available for corn cribs and similar uses. There has also been an improvement in the building demand in smaller towns, where yellow pine is the chief line stocked. Great efforts are being made to speed up the output of ship timbers and lumber for other government needs. The car shortage, however, is interfering even with this trade. Railroad companies are resorting to many lines of routing in order to get stocks through to destination. The trade in North Carolina pine is also affected by the shortage. It

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

is easy enough to make sales, but very difficult to make delivery. The greater part of the business reported is on government account, and for this purpose cars are more plentiful than for ordinary trade. The outlook is for shipments considerably in excess of production during December. Government purchases include large quantities of No. 2 and No. 3 flooring, etc.

There is not so much trade in white pine at present as is usual at this time of year. This is the result of a shortage of stock rather than a reduced demand. Stocks in the North and West are far below normal. Even with a car shortage during the winter, it is expected that some grades of white pine will be off the market long before the winter is over. There is a strong trade in choice factory stock and also a good demand for the lower grades. The urgency of the demand for airplane spruce has induced the United States Government to take strong measures to prevent obstruction in the production of spruce logs on the West Coast. Between 8,000 and 10,000 soldiers are being distributed at the camps wherever necessary to take care of any attempted interference with production. The spruce market in the East continues firm, and sales of all grades are easier to make than shipments. The trade in hemlock is light, but stocks in first hands are scarce, and the outlook for heavy production is none too bright. Hemlock prices have been firmer in some districts of late.

The heavy demand for Douglas fir for shipbuilding continues. Railroads and retailers are also giving out good orders. The car situation on the Pacific Coast shows no improvement. Western pine manufacturers are working their plants as fully as possible, trying to get out a heavy cut, rather than to concern themselves about getting orders. A little improvement is reported in the car supply, and all the cars available have been shipped out promptly. Shipments during the past few weeks have been greater than orders.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Market Report—Prices Firm

Ottawa, Dec. 10.—(Special to the Canada Lumberman.)—The Ottawa lumber market, during the first ten days of December, remained firm, with a tendency toward higher prices. The market is not overstocked. The local demand, especially for the building grades, has fallen off. Export orders continue to keep up, and in some instances new business is reported. Prices of several grades advanced from one to four dollars per M. during the first seven days of this month.

Retailers believe that this month's business will equal, if it does not surpass, in volume that done during a corresponding period a year ago. The great interest centered in the coming federal election will porbably have its effect on the trade, as it is felt at Ottawa that buyers will postpone orders till after December 17.

All the sawmills in the Ottawa district have closed. The last was that owned by W. C. Edwards & Co., at Rockland, which stopped on December 5. Indications generally point toward an improvement in the woods labor situation. Mr. George H. Millen, head of the E. B. Eddy Company, reports that arrangements have been made with the government, or the Military Service Council, whereby the men of the first draft in the company's employ in the woods are given exemption for three months. Camp supplies already in the woods will thus be used, and the company will be reasonably sure of getting its cut this season.

The transportation situation, which improved in November, is again causing trouble. Shippers complain of having difficulty in securing cars for shipments to the United States. It is now necessary to present a statement that the shipment is a war order and is sanctioned by the American Government.

The Imperial Munitions Board has called for tenders on powder boxes. The tenders were returnable on December 11. Powder boxes have not been made by Ottawa plants since last spring. The demand for this kind of box may result in advancing the present market quotations for mill-run white pine.

Shepard & Morse report a successful sawing season. The sawmill closed on November 25, having operated later than for the last three years. This was due to logs being readily available. There was little or no congestion of logs on the Ottawa River this year. Twenty-five employees of the Shepard & Morse Company at Ottawa are affected by the first draft call. The woods and camp operations are reported to be satisfactory and well under way.

The Hawkesbury Lumber Company reports that conditions in its camps are showing improvement, and are better than those existing last month. No estimate of this season's cut is yet obtainable.

A decrease in local trade is reported by the McAuliffe-Davis Lumber Company. This plant is experiencing difficulty in transporting orders to the American market. Good progress is being made on the shell box orders received some time ago.

Gilmour & Co. state that business has continued good during the latter part of November and up to the date of writing. New orders and American business have been received. The new cut which will come into the market next spring is expected by Gilmour & Co. to bring higher prices..

Mr. Jackson C. Booth reports that the woods operations of John R. Booth are "unsatisfactory." A shortage of woods labor is reported. "Some of the men are shifting from one camp to another all the time," said Mr. Booth. "Perhaps they think it will be harder to keep track of them if they are liable to the Military Service Act," he added. Arrangements for the exemption of the woods employees for a period of three months are under way.

The majority of the hands laid off at the Rockland and Ottawa sawmills will go to the woods.

The order for 128,000 shell boxes, referred to in the last report, has been confirmed. It went to the Estate of James Davidson. In addition to this, a new order for 5,000 Bethlehem boxes has been received. A third order for 300,000 commercial boxes was received early in December. The mill is very busy, operating sometimes at night. The woods operations are going ahead rapidly. One hundred and fifty men are engaged in the bush. It is expected that 100,000 logs will be gotten out by Christmas, and, if the snow does not become too deep, it is intended to increase the cut before the woods season closes.

Local Trade Very Quiet at Montreal

Montreal, Dec. 10.—(Special to the Canada Lumberman.)—As a whole, trade is satisfactory. Local business is very quiet, but orders for United States account are coming in fairly well. A large number of enquiries for shell box lumber by United States firms are being received, and, were the car situation better, a considerable increase in the shipments would be made.

Until further orders for ships are placed, the lull in the demand for British Columbia timber is likely to continue, owing to the closing of contracts for immediate needs. The business in general British Columbia lumber has, however, picked up a little.

Prospects for purely local trade are not good. There are practically no large building contracts in sight, and, according to architects, very few buildings of any size are contemplated for next spring. The chief work for which permits are being issued consists of houses of a little better type than usual. The total of the permits makes poor reading. For November they were valued at $219,355, a decrease of $646,175; while for the eleven months they were $4,299,053, a decline of $706,411. The reduction of building costs by means of co-operation between the supply men is to be discussed, but it is questionable whether this can be done, especially in view of the prospect of still dearer lumber. Efforts are also being made to induce people to build now, and not wait for an anticipated reduction in prices after the war.

The last boat for the United Kingdom has now left, taking a little lumber. Exporters have been engaged in taking stock of the season's shipments, and the amounts are not such as to cause satisfaction. At the moment of writing, the totals are not available, but a rough estimate puts them at about 20,000,000 ft., or a fifth of last year's exports. Most of the lumber was, directly or indirectly, for government account, and consisted mainly of spruce. This, however, does not represent the whole of the exporters' business, as shipments have been made through Boston, Portland, and New York, chiefly of hardwoods.

St. John River Operations in State of Maine

The Bangor, Me., Commercial, says that the log cut on the St. John and Allegash waters during the coming winter will depend very much upon the ability of the various operators to get sufficient labor. Some of the operators have been fortunate enough to obtain somewhere near a full crew with which to yard the logs, while others have been short of men all fall. There are, of course, several well-known reasons for the shortage of woods labor this year in all parts of the state. On the St. John and Allegash waters, and also on the Aroostook River drainage there have been large operations for pulpwood during the past summer. These pulp operations are a new proposition to this

part of the state, and to carry them on during the summer drew largely from the labor usually employed in the fall and winter logging operations. As the pulpwood operations have been brought to a close the labor situation has improved. Information obtained from those directly interested in the logging operations in Northern Maine indicate a somewhat larger cut during this winter than was obtained last year. The following estimates are made by one who is closely in touch with conditions, and are based upon the present forces employed.

On the St. John River waters Charles E. Jones, of St. Francis, Maine, cutting on the Little Black Waters, will get four million feet of logs. Mr. Jones' spruce, fir, and pine logs go to the St. John Lumber Company at Van Buren, Me. He manufactures his cedar at his St. Francis mill.

Randolph & Baker, Ltd., of St. John, N.B., will cut from four to five million feet, and will drive the logs to their mills at St. John, N.B.

Ward & Bradbury, Inc., of Fort Kent, will cut 3,000,000 feet of logs on the St. Francis and St. John Rivers, and will drive the logs to its mill at St. Francis for manufacture. This company also cuts several million feet each year in Canada and hauls the logs into Maine for manufacture.

Murray & Gregory, Ltd., of St. John, N.B., plan on cutting 4,000,000 feet on Chimenticook Stream and driving the logs to their mill at St. John, N.B. This is the first season that this company has cut logs in Maine for many years. Its operations have been confined to Canadian lands.

The St. John Lumber Company, with mills at Van Buren, is cutting 5,000.000 feet on the St. Francis River. This company will also have operations of some 10,000,000 feet on the main St. John River, and about 10,000,000 feet on the Allegash River.

Arthur I. Noble, of Fredericton, N.B.; W. N. Cunliffe's Sons, of Fort Kent, Me., and Albert M. Currier, of Seven Islands, Me., are operators for the Stetson, Cutler Company, with mills at St. John, N.B. Mr. Noble cut 7,000,000 feet on the main St. John River. Mr. Currier will cut 5,000,000 feet on the same river.

The Messrs. Cunliffe will cut 10,000.000 feet or more on the Allegash River waters.

John A. Morrison, of Fredericton, N.B., is cutting on the extreme Upper St. John River waters, and plans to obtain some 5,000,000 feet.

B. C. Howard & Co., Inc., a Canadian concern, with mills at Lac Frontiere, is cutting 3,000,000 feet of logs on the American side and hauling them directly to its mills for manufacture. The lumber is shipped out over the Quebec Central Railroad.

On the Allegash River lands during the past seasons the American Realty Company, a new concern to that section, has cut pulpwood to an amount estimated at 40,000 cords. This wood is peeled and cut into four-foot lengths, and will be driven down the Allegash River to the St. John River and thence to St. John, Me., where it will be taken out of the water and shipped by the Bangor and Aroostook Railroad by the company's several mills in this state. This company has begun extensive operations in Northern Maine during the past year, and in the future bids fair to be a promising factor in the lumbering interests in that section of the state.

On the Fish River waters the Fish River Manufacturing Company, with mill at Eagle Lake, will make its usual cut of 10,000,000 to 12,000,000 feet.

The Fort Kent Mill Company, with mill at Fort Kent, will cut 3,000,000 feet.

J. A. Laliberte, with mill at Wallagrass, is cutting 2,000,000 feet. Mr. Laliberte makes a specialty of shingles.

On the upper waters of the Fish River the Portage Lake Mill Company, with mill at Portage, is cutting its usual amount of from 12,000,000 to 15,000,000 feet.

The Ashland Company, with mill at Sheridan, is cutting 4,000,000 feet on the Machias waters and 8,000,000 feet on the Aroostook waters.

In addition to the logging operations on the Aroostook the Orono Pulp and Paper Company has cut during the past season several thousand cords of peeled wood, to be shipped this winter over the B. and A. Railroad to its mill at Orono.

Eastern Canada Manufacturing Situation

A Canadian correspondent, writing to the New York Lumber Trade Journal about business conditions in Eastern Canada, says:

"Things have worked out very much in line with expectations, with the result that to-day we have little dry lumber to offer; further, we might say that last spring's prices have been well maintained throughout the season, sometimes with a possibility of getting a higher figure in certain sections that we ship to, but regret to mention that the grades in lath from this section shipped to the United States have been severely criticized during the past couple of months by the purchasers on your side. These people generally inspected the quality with a magnifying glass called 'a drop in price.'

"With regard to the prospective condition, this would be very difficult to outline, but, judging by present appearances, we would conclude that a great deal of difficulty would be experienced by manufacturers this winter if they tried to get out the same quantity of logs as was done last year. Of course, conditions may improve within a few months, but there is nothing to warrant this view at the present time. For instance, the contracts which have been already given for log-making, delivery to be made generally on river banks, in some cases many miles away from the mills, have been let out at a marked advance in price as compared with last year. Then, again, if we were obliged to pay a proportionate increase on labor next spring as was done this year, it would certainly not only raise the price on sawn lumber, but it is actually possible that it would prevent smaller concerns from being able to operate next year, for the reason that it may prove impossible for them to get the necessary money to complete their sawing season, hence some of them wouldn't dare start if unable to finish, especially in view of the scarcity of cars, this being a means of preventing them from turning their lumber into money soon enough. This condition re cars would be serious to the operator if ships continue to be unavailable.

"In regard to ourselves, we might say that we have seen fit not to dispose of most of our 1917 cut because we don't believe it interesting to any buyer to sell him green stock, and, further, not deliver it as promptly as he wants it. Then, again, so long as the war lasts labor will become more scarce with us, and, therefore, the whole idea of volume in feet must be forgotten, because it can't be very well delivered by everybody, so that we have kept a few million feet of nicely assorted widths, thickness, and qualities of lumber put up in good shape and well covered so as to leave the stock as free from snow as possible. All this we have done for our regular customers, to whom we are very grateful, and for whom we have acted accordingly, and we know that our customers appreciate how advantageous our position is toward them.

"Therefore, with what will likely be manufactured next year, plus what we have kept from 1917 cut, we shall be in a better position than if we had sold more of our lumber and not been supplied with the necessary rolling stock to deliver it, although we must not convey to the trade that we are not shipping; contrary to this, we are pleased to say that at our St. Maurice River point of loading we have very few back orders as compared with sections like the Ottawa Valley and certain districts in New Brunswick."

Hardwood Markets in the United States

The Hardwood Manufacturers' Association of the United States, in its latest market letter, says: There has been a noticeable improvement in the hardwood market during the last two or three weeks. Enquiries are more numerous and prices are steady, with a tendency toward higher levels, this being due, in part, to the many embargoes and car shortage. The hardwood lumber industry is beginning to realize that the country is on a "war basis," and that the time is approaching rapidly when only lumber actually needed for war purposes will be permitted to move. Manufacturing operations are having to be curtaled throughout the hardwood territory because of the labor shortage and the scarcity of cars for handling logs, and stocks are in nearly every case below normal. The demand for government purposes shows no let-up. The increased call for the thicker stocks has materially reduced the production of one-inch lumber, and large consumers, realizing this fact, are endeavoring to get cover on requirements to carry them for some time. Whatever changes have taken place in the lumber trade situation during the last month are in the direction of greater concentration of the business in the hands of the government, or, to put it differently, the government requirements are getting to be more and more the chief reliance of the lumbermen.

Oak, ash, and hickory suitable for the manufacture of the various implements of war are in great demand. Hickory especially is needed in large requirements by the government, but stocks are low. Plain oak in stock thicker than 4/4 is in excellent call, and it is difficult to supply the demand. As a matter of fact, the only items dragging just now are those ordinarily in demand from the furniture trade and for building purposes. If signs can be interpreted correctly, very little furniture will be manufactured until after the war.

Building permits for the month of October showed a loss of 40.5 per cent. as compared with the corresponding month a year ago. In New York City the loss was 70.6 per cent. Money continues in good demand, and is firm, with rates unchanged at 5½ to 6 per cent. for all classes of loans. Business failures in October, both in number and amount, were less than during any corresponding month since 1906. Bank clearings for October show an increase of 9.9 per cent. over the same month last year, and of 39.2 per cent. over the same month in 1915.

The corn crop of 1917 is more than 66,000,000 bushels larger than ever grown in the history of American agriculture. Heavy killing frost, widely scattered, caused an unusual deterioration in the condition of cotton. Reports seem to indicate a complete loss of the top

Cut Down Your Butter Cost Use H. A. Brand Oleomargarine

IF you are responsible for the purchase of supplies —you will be keenly interested in the money you can save by supplying your camp with this new butter substitute.

H. A. Brand is the first Oleomargarine to be made in Canada. It is manufactured in one of the most modern Oleomargarine factories on the continent, under the eyes of the Canadian Government Inspectors.

In taste and in color, you cannot distinguish H. A. Brand Oleomargarine from butter. Because of the very high grade of the selected and nutritious oleo oil and the best of creamery butter used in its manufacture, it has a rich golden tint.

H. A. Brand Oleomargarine will keep as well as pasteurized creamery butter—better than lower grades of butter. And it is always uniform in flavor.

We would advise against purchasing the lower grades of Oleomargarine as being almost sure to cause dissatisfaction.

Write us direct or get it touch with our nearest branch for quotations.

H. A. Brand Oleomargarine is put up in tubs for Lumber Camps.

THE HARRIS ABATTOIR COMPANY, LIMITED

TORONTO - CANADA

Branches at: SUDBURY, OTTAWA, HAMILTON, MONTREAL, QUEBEC, HALIFAX, SYDNEY, ST. JOHN, NEW GLASGOW

crop, and it is now stated that the yield will fall below 11,000,000 bales, excluding linters.

As to future prospects, although war preparations are stimulating us into a period of great business activity, there are many reasons to believe that general business has now reached dangerous levels. Of course, with the war stimulation it is probable that the volume of business may persist for months. In accordance with the law of equal and opposite reaction, a period of depression will, of course, eventually appear. This reaction may be precipitated at any time by the ending of the war. Hence the thing to do is to be cautious about long-term obligations, commodity purchases, and extensions.

The Care of Saws

Whatever the nature of the business considered, the prime essentials for success are practical experience and adequate equipment. The former can be acquired in time by patient study of the subject, greater and quicker progress being gained by a knowledge of the general experience of others, backed by personal experiment and practice; while the latter may be purchased from manufacturers of tools and machinery, whose particular duty and aim is ever to improve their own product.

Lack of proper equipment and facilities, however, is a great handicap, no matter how skilled or able a man may be. This applies with especial force to the filing room.

With these facts in mind, and also considering the diversity of opinion and methods, often controlled by individual ideas and theory, in writing this article on the "Care of Saws," the information and instructions here given are based on actual working conditions, and are the result of long, practical experience.

Conditions, of course, vary, and it is impossible to lay down hard and fast rules covering every contingency. Nevertheless, these instructions are fundamental and applicable, with modification, according to the circumstances.

Though the many large sawmills have up-to-date and completely-equipped filing rooms and expert filers, it is surprising to note the number of medium-size and small mills that lack even the most necessary appliances for refitting their saws.

No matter how small the mill and output, it would be found advantageous to have a man connected with the mill who has a good understanding of repairing and fitting saws, and where the production approximates 15,000 feet daily, or 10,000 feet for a saw and planing mill, the employment of a good filer with proper equipment certainly pays, especially if his duties include those of mill foreman.

In any event, every saw and knife must be resharpened and given attention from time to time, whether the work be done at the mill or by an outside filer.

In the case of sending them outside for repairs, then it is a safe guess the saws and knives will be kept at work on the mill until they are so dull they will not cut freely, which is the principal cause of breakage. Little or no consideration is given to the liability of the dull saw cracking, nor the lessened output, or poor quality of product which is the inevitable result. The operators' chief idea, seemingly, is that of keeping the saw running until it can't go any longer.

It must be remembered that the life and efficiency of the saws depend as much on the accuracy of the setting and sharpening as upon the quality of the material and temper in them. Further, all working parts of the machine should be in true alignment, all bearing well babbitted, properly adjusted and lubricated.

A little thought and figuring will show that running dull tools is extremely costly, for the summing up must include the loss in production, the difference in value of the poorly manufactured lumber, the extra waste, the forcing of the saw or knife racking the mill or machine, lessening its term of life or causing breakage, and then eventually a greater expense for refitting the saw or knife, which must be done sooner or later.

On the other hand, given a well-equipped filing room in connection with the mill, and a capable filer, it is an easy matter to maintain the saws and knives in such excellent condition that the mill is kept continuously running and giving the maximum output of well-manufactured lumber. This satisfactory state of affairs can be attained only by exercising due care and promptly refitting the saws and knives at the first sign of becoming dull.

Less work is required to resharpen a half-dulled saw twice than a very dull saw once, and if resharpened when only half dull the saw is continuously nearer the 100 per cent. efficiency mark as to fitting and results.

It cannot be too strongly urged that saws and knives, as well as any other cutting implement, must be kept sharp to do good work. Not only do they cut to better advantage, but the work of refitting, if done at the proper stage, tends to promote the life and efficiency of the entire outfit—the men included.

To those employed in a sawmill the scene is so familiar that it

No Sawmill, however small, is complete without a TOWER EDGER

It increases the output of a mill one-third.

It relieves the main saw of a great deal of work, leaving it free to perform its proper function of cutting up logs; and when the log is disposed of, the edging is also done.

It makes more merchantable lumber per log.

It wastes the minimum quantity of material, saving considerable No. 1 lumber that is lost when the edging is done with the main saw.

It raises the grade of the lumber, removing hearts, shakes, and knots, making firsts and seconds out of commons, and so cutting up every board as to make it as valuable as possible. For example, a board that will grade as No. 2 may be ripped so that one piece goes into the No. 1's and the other into the No. 2's.

It gives the boards straight and parallel edges.

It makes them of standard or any desired special widths, and automatically cuts them scant, exact, or plump, as desired.

It is also used extensively for ripping.

To the Lumber Companies of Canada:

You have the Goods. Place your Lists with full particulars in our hands. We are in daily touch with all the Buyers in the United Kingdom.

PLEASE NOTE.—We pay cash against all documents, and take the whole of the Delcredere risk on Buyers.

Install a KRAFT SODA MILL

CANADA has another big war opportunity: Great Britain needs more wood pulp. Install a small Soda Pulp Plant and Supply this need by converting your Slats, Tops, Bottoms and waste wood around the Saw Mill into pulp. We can dispose of any amount. Previous sources of supply in Sweden, etc., have recently been withdrawn and Canada now has a free field in Great Britain to market unlimited quantities of wood pulp. We can arrange contracts for long periods.
The cost of installing plant is small and you make a sure profit from waste material.

Write to-day for further details

202 Board of Trade Building

MONTREAL

apparently lacks in significance, yet the swiftly revolving, keen-toothed circular saws entering the huge logs as though no obstruction whatever stood in their way, zip! and a section is cut off with ease and celerity; the quick motions of the men and the working of the various machines in converting the logs into staves and heading in the modern cooperage mill, all form a curious and wonderfully interesting sight to the visitor.

First we see the great quantity of logs on the mill pond or skid-way; then, glancing along, we see them, one after another, in continuous procession, taken up the incline, by means of a conveyor chain. Reaching the mill deck, the log is "kicked" off the haul-up chain by a steam appliance known in sawmills as a "kicker" or loader. Sideways the log falls on the conveyor chain or "hedgehog," and is fed under the drop saw.

In the cooperage mill there is a scene of intense action. The drop sawyer apparently acting as though stepping on hot stones, hops on a foot lever, then on another, at the same time pulling a lever on the right, next shoving one on the left, in the endeavor to keep the log in continuous motion; down drops the swiftly revolving 72-inch circular saw, cutting off in few seconds a 20-inch or 30-inch section of the big log; forward goes the log, pushing along the section; a kick of the foot brings up the "stop," which quickly kicks up the cut section; and while in mid-air, as it were, it is grasped by a man with pike and hook and, without pause, is rolled or bounced to either the bolters or the heading machines, which is determined by the length of the section.

The bolting operator grabs the section of log with a hook, places it on the carriage of the bolter, a quick acting short-log sawmill, and here again is a swiftly revolving 60-inch circular saw, which first splits the short log in half, then in quarters, sixths, or eighths, as required. These are called "bolts."

The shorter section is passed to the sawyer operating the heading saw, where the stock is reduced to suitable thickness of board for slack barrel heads. This is usually accomplished by a horizontal or a pendulous carriage machine. With the latter the section of log is placed on the carriage, which is swung by hand-feed toward the saw and a board is rapidly cut off, then the carriage swinging back again, the stock is moved into position for another cut, and so on until the stock is entirely cut up. This machine is capable of making twenty or more cuts a minute.

Some understanding of the push and activity on this work may be had from the fact that the bolting and heading sawyers are trying to keep up with the drop sawyer, and the latter always endeavoring to get ahead of the former; and as it takes but a few seconds to cut off a section of log, that neither falls far behind, shows they are going some.

While for general sawing 10,000 feet rim speed per minute of a large saw is considered the maximum, in a cooperage mill the conditions are different and the duty required of the saw extremely difficult, for here the speed is high, the action fast, and the lumber hard; the saws being subjected to a severe shock every time they start a cut—the large saws making as many as six to ten cuts per minute through a log.

Bearing on the matter of speed, in some cooperage mills the drop saws 60 inches or larger in diameter, are run at about 700 revolutions per minute; the 56-inch heading saws at 1,300 revolutions per minute; the "lay down" bolter saws at 750 revolutions per minute, and the upright bolters at 850 revolutions per minute, while the stave choppers are making 160 cuts per minute. In referring to this, however, it must not be construed that we advocate such excessive speed of saws.

Under these circumstances, therefore, it naturally follows that it is absolutely necessary to have the saws "put up" and continuously maintained in the best possible condition for highest results and longest life.—The Disston Crucible.

Quebec's Forest Protection Praised

In the speech from the throne at the opening of the Quebec Legislature, reference was made to the excellent system of forest protection in the province. It says: "The effective protection of our forests against fire and the improvement of the means at our disposal for that purpose are matters of wise administration. Tanks have been provided for the new associations recently formed with the concurrence of the Department of Lands and Forests; an important portion of the forests within the timber limits is already under most efficient supervision, and there is reason to hope that in the near future this system will be in force throughout our entire forest domain." It is also stated that good results have been obtained from the nursery of forest trees at Berthier, P.Q. During the present year alone half a million young trees have been distributed, most of which have been planted in regions swept by fire and unfit for cultivation. Ministers intend to encourage still further the reforestation of Quebec lands.

The first wooden merchant vessel of the United States Government fleet has been launched at a Pacific port. The ship is of 4,000 tons dead weight, 290 feet over all, and was built in 120 days.

All Wool MACKINAWS

Plain and Fancy Patterned

THE MACKINAW "WIND BREAK" or SWEATER (as shown in accompanying illustration) has all the advantages of a Sweater and Jumper combined. Heavy felted to break wind. Absolutely all pure wool. Knit wool sweater cuffs. Adjustable collar to be worn open or closed. Two pockets, grey, red or brown with black check.

EDGINGS

Ontario

The Standard Chemical Company recently sustained a serious loss by fire to their chemical plant at Sault Ste. Marie, Ont.

Chew Bros., Midland, Ont., have closed their mill for the season and contemplate remodelling and enlarging their lumber mill.

The Kinleith Paper Company, Welland Canal, St. Catharines, Ont., are about to start work on repairs to cost $5,000, to their paper mill which was recently destroyed by fire.

Samuel S. Lambert, Welland, Ont., reports that he has put in a camp in the township of Sweeney, Ont., and will take out three million feet of the timber which he recently purchased from the Ontario Government. He is arranging to put in a mill to saw the lumber.

The Toronto Shipbuilding Company, Limited, have completed the framing on one of the wooden vessels they are building for the Imperial Munitions Board and have made good progress in connection with the framing of the second vessel. The first vessel is now being planked in.

The Goderich Manufacturing Company, Ltd., Goderich, Ont., who recently suffered a loss by fire, report that they intend to rebuild as soon as weather is favorable next spring. They will put up a two-storey reinforced concrete building, 110 x 204 feet, and intend to make it as nearly fireproof as possible.

The Ottawa Paper Box Company, Limited, has been incorporated with head office at Ottawa, Ont., and capital stock of $150,000, to carry on business as merchants, manufacturers and dealers in paper, pulp, wood and lumber of all kinds. Among those interested are A. C. Fleming, W. S. Mackenzie and J. E. McVeigh.

The Colonial Lumber Company have purchased the Petawawa Lumber Company's mill and are dismantling it and rebuilding the mill recently destroyed by fire. The new mill, machinery, etc., are being supplied by the Waterous Engine Works Company, Brantford, Ont. The work on the mill will be done by day labor.

The Dominion Lumber and Coal Company, Limited, has been incorporated with head office at 265 King Street East, Hamilton, Ont., and authorized capital of $40,000. The officers of the company are W. S. Stout, of Toronto, Herbert Brennen and E. S. Smith, of Hamilton. Mr. W. S. Stout is president and general manager of the Dominion Express Company of Canada, and Messrs. Brennen and Smith are lumbermen who are well known to the trade.

Eastern Canada

The St. Lawrence Lumber Company, Quebec, P.Q., has been registered.

A report from Amherst, N.S., states that the International Engineering Works have received extensive new orders for shells and that their plant has been put into operation once more, running with three 8-hour shifts.

The Three Rivers Box Company, Three Rivers, P.Q., who are erecting a box factory to cost $60,000, have not purchased the machinery for the manufacture of wooden pail handles and would like quotations on same. Correspondence should be addressed to the company, care of N. E. Clement, Three Rivers, P.Q.

The Smith Lumber Company, Woodstock, N.B., expect to put in about 3,000,000 feet of logs this season. They are operating two camps, one in Northampton and one in Wilmot Parish. They expect to open their mill about February 1st. The company have taken over the cooperage plant at Woodstock and are installing machinery for barrel production.

Western Canada

The Graham Island Spruce and Cedar Company, Prince Rupert, B.C., are preparing plans for the erection of a sawmill, wharf, etc., at Port Clements, B.C. (Queenstown Harbor).

The planing mill belonging to Wilker & Son, Berge Street, Rosthern, Sask., was recently completely destroyed by fire. The owners are contemplating rebuilding, and will probably require machinery and engines. There was no insurance.

The Century Logging & Lumber Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $10,000, to carry on business as loggers, foresters, timber merchants, sawmill and planing mill proprietors, and to manufacture and deal in wood pulp, etc.

The Hardwood Lumber Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $15,000, to carry on business as manufacturers of and dealers in all kinds of hardwood, lumber and timber, and as loggers, timber and lumber merchants, sawmill and shingle proprietors.

The Wm. Lyall Ship Yards, North Vancouver, B.C., which has a contract for six standard steamers for the Imperial Munitions Board, has laid the keels for the fourth and fifth of its vessels. The four vessels are in an advanced

stage of construction and the company report that labor is plentiful. There are about 750 men on the company's payroll at present.

Sealed tenders are being received by the Minister of Lands for British Columbia, until the 24th day of December, 1917, for the purchase of License X1163, to cut 4,160,000 feet of larch, cedar, fir and hemlock, and 650 cedar poles, situated on Cork Creek, near Creston, Kootenay District. Two years will be allowed for the removal of the timber. Further particulars may be obtained from the Chief Forester, Victoria, B.C.

The New Westminster Construction and Engineering Company, Limited, New Westminster, B.C., which is building four wooden standard steamers at its Poplar Island yard for the Imperial Munitions Board counts upon being ready to launch the first vessel on February 1st, the date scheduled. The work is progressing satisfactorily and planking is now under way. The company's second vessel is about ten days behind the first and its third vessel is nor far behind the second one. The keel of the fourth vessel has been laid. About 400 men are engaged in the yard.

Harris Abattoir Company's Oleomargarine Output

The Harris Abattoir Company, Ltd., Toronto, who are making an announcement in regard to their oleomargarine elsewhere in this issue, invited a representative of the Canada Lumberman to visit their plant recently and see the process of manufacture. The visit was an extremely interesting one. The process was shown and explained from start to finish. In the first place, the company use certified milk with which to start the culture. Ordinary milk is next used, in the proportion of about 50 gallons to each thousand pounds of oleomargarine to be produced. These are put through various clarifying processes until they are ready to be weighed upon the scales and to be mixed with the oils and fats that make up the balance of the product. The oils and the fats used are varied, sometimes being neutral lard, cocoanut oil, or cottonseed oil. Along with these is mixed a certain proportion of butter. At this stage the product is weighed out, and this is run to a vat filled with water, in which it is agitated mechanically until it forms into "crystals." In this stage it is taken out with specially designed forks, and placed in large boxes, where it stands for a specified period of time, when it is taken to a department, where it is mixed with a proportion of creamery butter and the whole is put into a churn, where some of the excess liquid is worked off. The finished product is then ready for packing and delivery.

The oleomargarine manufactured by the Harris Abattoir Company, Ltd., is a very palatable product, as the representative of the Canada Lumberman can testify from experience. Its keeping qualities, the company states, are better than those of butter, and they also claim that its nutritive value is fully equal to that of butter if not greater. There is one peculiarity of oleomargine to which the company draw attention, which, while not reducing its value, may be thought by some who are not acquainted with the facts to be an indication of deterioration. This is the fact that when kept in the cold it has a tendency to bleach. This characteristic, however, is one of appearance, and does not affect either the taste or the food value of the product.

Forestry Association Issuing Animal Guide

An "Animal Guide" to the North American wild animals, written by Charles K. Reed and illustrated in colors by Harry F. Harvey, is being distributed by the Canadian Forestry Association. This interesting book, which is attractively published and substantially bound in leather, can be had from the association at the price of one dollar. We feel sure that a great many readers of the Canada Lumberman will be specially interested in this book. The information it contains is of exceptional value to all who are interested in wild life. Practically every important animal known to North America is described, and the color illustrations give an exact impression of the appearance of the animal in its native haunts. Not only do the descriptions include the ordinary characteristic appearance of the animals, but tell of their many interesting habits, so that one cannot fail to obtain a practical working knowledge of the methods of life and the appearance of each animal described.

Readers of the Canada Lumberman who are interested can obtain copies of this splendid little book, which is published in pocket edition size, by addressing the secretary of the Canadian Forestry Association, Ottawa

Canadian Paper Exports

Imports of printing paper for books and newspapers into the United States from Canada during September amounted to 91,270,081 pounds, valued at $2,572,768. Total imports of printing paper for books, etc., for September were 97,221,051 pounds, valued at $2,752,777;; imports of wrapping paper, 740,650 pounds, valued at $46,343; imports of wood pulp for September, 43,586 tons, valued at $2,735,018.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

Lumber Dealer's Experience

The very best evidence we can offer of what a "Little Giant" Motor Truck will do for you is in the experience of lumber dealers and lumbermen who are now using them. Here's one taken at random: "We use a Little Giant one-ton truck, which has been giving us exceptionally good service. While its guaranteed capacity is only one ton, it is very strongly built, and we carry nearer two tons than one a good share of the time, although we do not aim to use it for heavy hauling."—Foster Lumber and Coal Company, Valparaiso, Indiana. This is an extract from their letter, but it is sufficient to give you their satisfied viewpoint.

The "Little Giant" Motor Truck

is standardized. Every essential part of machinery is good from start to finish. We can show you a saving in money over horse-drawn trucking that will be almost unbelievable without the actual proof. Little Giant Trucks are so tool-proof your men can take hold immediately and get real service from them. Write for literature and information.

USE LOGGING MACHINERY

IN PLACE OF MEN

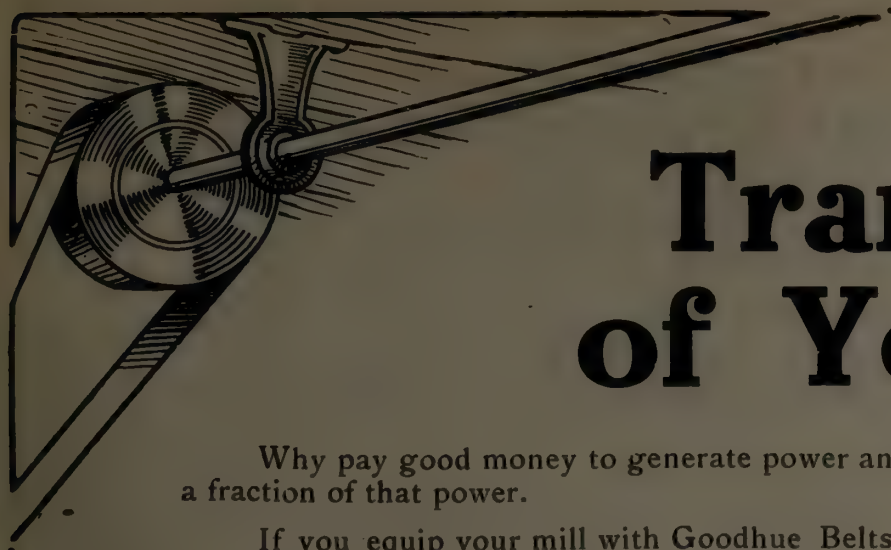
After the tree is cut down, then comes the expensive process of getting the logs to the mill.
Much of this expense can be saved, and at the same time the work done easier and quicker by the use of Marsh & Henthorn

Hauling or Skidding Engines and Loading Engines

We make the right size and style Engine for your camp, whether your output is large or small

Our booklet "Suggestions to Lumbermen," describes many expense saving methods of handling logs with inexpensive outfits. If you have not received your copy yet, drop us a card
Our experts are at your service also. Let us help you to save money in getting out your season's cut

MARSH & HENTHORN, Limited, BELLEVILLE, Ont.



Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue Belts stretch 15% to 25% less than other belts and have just the right amount of "cling" on the pulley.

Write us for particulars and prices

YOU CAN DO IT WITH A— GOODHUE BELT

Winnipeg Agents: Bissett & Webb, Limited, 151 Notre Dame Ave. East, Winnipeg, Man.
Vancouver Agents: Fleck Bros., Limited, 1142 Homer St., Vancouver, B.C.

J. L. GOODHUE & COMPANY, LIMITED.
DANVILLE, QUEBEC CANADA.

FOR SPEEDY WORK

USE COMPRESSED AIR

FOR EXAMPLE:

"The erection of the frame work of the Rochester Combined 300 ton mill is nearing completion, and sets a new record in mill construction."

"Compressed air is used in boring all timbers and driving ship spikes. A Little Tugger Hoist is used in placing timbers."

"Two shifts of carpenters are employed, the night shift working by electric light. . . . . About 500,000 ft. B.M. of timber will have been used."

"In spite of the scarcity of supplies, the construction engineer, believes the mill will be completed by November 1st." "Mining and Scientific Press."

"CC-15" Drift Bolt Driver fitted with cross handle for down driving. This tool arranged with telescopic air feed, extension leg, was shown in last issue.

The use of pneumatic tools on construction work has come to stay. Labor is scarce and early production is required from every plant in course of erection in this country. The "Pneumatic Way" has proved to be the best for rapid work at minimum expense.

The "Little David" Wood Borer and the Little Tugger Hoist will be shown in later issues. Watch for them.

Write for information on "Little David" Pneumatic Tools, Air Compressors, and all equipment necessary to do your work the "Pneumatic Way"

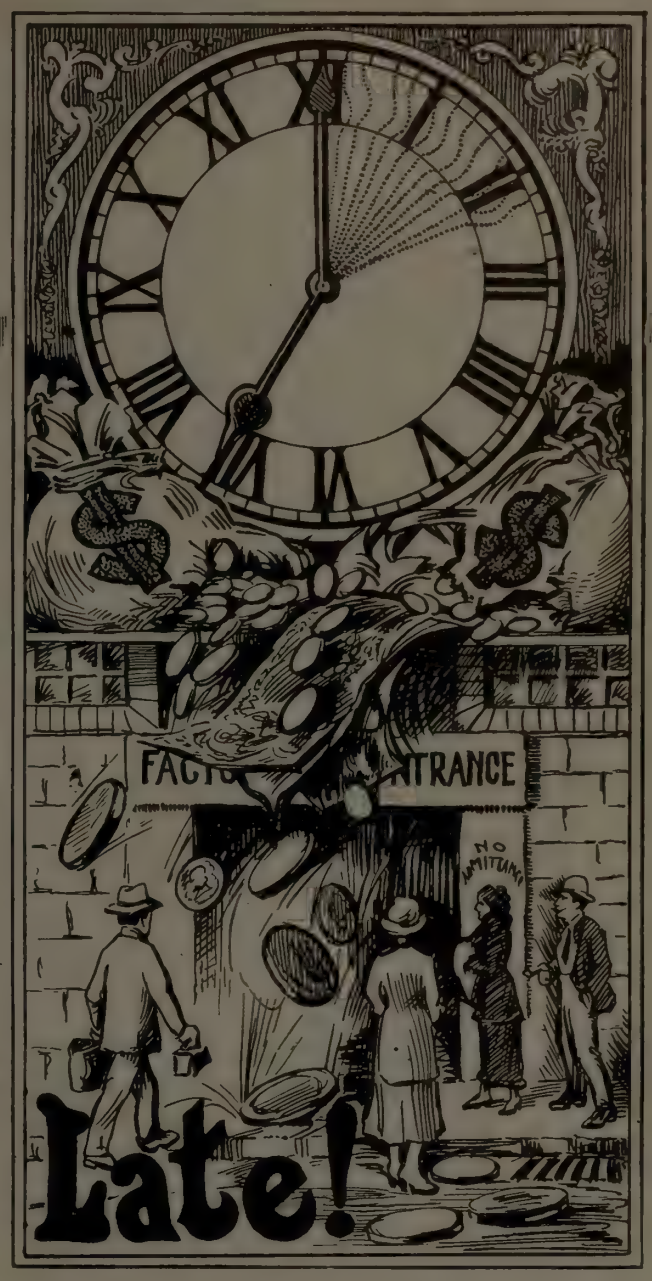
You Pay For an Hour —You get 50 minutes And Less

You might as well throw your profits in the street

Time is a commodity—it is an article of commerce—you pay the full price for it and yet you have no record of value received.

For instance—without a time recorder your employees are dilatory—five minutes here or there will never be noticed—a hundred have the same idea. What does it cost you?

Again—you not only pay for their lost time, but also the time your expensive equipment is standing idle. Your overhead expenses are the same, regardless of this inefficiency.



The International Time Recorder Pays for itself — It stops this leak

It is better than any alarm clock ever invented to get your employees "on the job" on time. The original pay roll entry is printed by the employee himself. You pay for what you GET—sixty minutes to the hour—not fifty or less.

There is an International particularly suited to your requirements. Prices from $137 up.

WHOLESALE LUMBER

Eastern Spruce
Hemlock
Pine
Shingles and Lath

Shipment by car, canal boat or cargo.

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

Douglas Fir
Red Cedar Shingles
Hard Pine
Maple Floors

We manufacture Spruce at our own Mills at Portage, Maine, U. S. A., and therefore we know what big prices mean to the manufacturer

11 Broadway, NEW YORK, N.Y., U. S. A.
126 State Street, BOSTON, MASS.
Western Office: Lumberman's Bank Bldg., Portland, Ore.

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

The Corbet Automatic Steam Towing Machines

The Corbet Automatic Steam Towing Machines are installed on a large number of the best Tugs on the Atlantic and Pacific Coasts and on the Great Lakes and have proved so satisfactory that not one of our customers would be without them under any circumstances as they have proved the best investment the owner ever made in equipping his tug. Why continue to be without our Towing Machine which will increase the efficiency and earning power of your tug?

Write for information, testimonials and prices.

The Corbet Foundry & Machine Co., Limited, OWEN SOUND, ONTARIO, CANADA

ASTONISHING REVELATIONS!

THE Honorary Advisory Council of Scientific and Industrial Research appointed by the Dominion Government to ascertain what steps can be taken to prevent the existing waste, and to promote the conservation of natural resources, has brought to light some startling facts during its sitting in British Columbia. The enquiry dealt especially with lumber production and by-products. The president of a big lumber company said that "in handling trees for ordinary timber purposes, fully half the bulk was left behind, and 20 per cent. was lost by sawing boards alone." There is no reason why this "waste" should not be fully utilized and turned into a money-making account.

UTILIZATION OF WASTE WOOD

We have a wide experience in the design and construction of complete plants for the economical using of waste woods.

DISTILLATION PLANTS **PULP MILL EQUIPMENT**
WASTE SULPHITE LIQUOR FERMENTING PLANTS
OXALIC ACID PLANTS **ALCOHOL PLANTS**

Send us your enquires, we will give you our best services by return

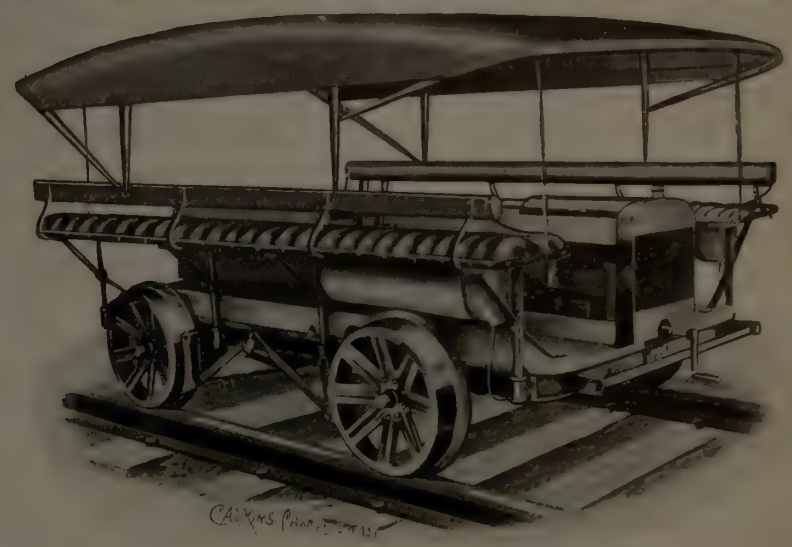
NATIONAL Railway Motor CARS



For Passenger Service

We recommend this car highly for lumber companies operating a short line railway, as it is an ideal car for light passenger service, or tractor for hauling supplies, moving crews, etc. Frame is of 3 x $1\frac{3}{8}$ x $\frac{5}{16}$ channel steel; axles $1\frac{11}{16}$ inches with Hyatt roller bearings; 20 inch pressed steel wheels of extra strength. Four cylinder, four cycle, water cooled, 10-12 h. p. engine, equipped with Atwater-Kent ignition system, float feed carburetor with throttle and spark control, and kerosene attachment. We also equip the car with friction drive as it gives a variation of speed and power. Reverses by shifting friction wheel over center on the disc, and runs in either direction equally as well. Seats are nicely upholstered, with lazy backs; folding top with jiffy side and end curtains. The car is a complete job that will cut operating expenses in quarter.

Price Complete $600.00 F.O.B. Factory.—If interested write us for complete descriptive matter or place order direct from this ad. 4L

Northwestern Motor Co., 1500 Spring Street **Eau Claire, Wis.**

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at $26,774,937 or 40% of Canada's total output.

Pine production, 905,442,000 ft. B.M.
Pulpwood, 246,282 cords.
Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

Wherever good timber is located it will be worth more in ten years than it is worth today.

What you want to know is how much more—whether it will pay all charges and a profit—whether you should buy, sell, hold, sacrifice or be firm.

No one can give you better advice than James D. Lacey & Company. We either know already all there is to know about your prospective purchase or sale or can find out to your entire satisfaction.

A LACEY REPORT is as near the ultimate timber truth as it is possible to get.

The Babbitt Metal that's at the Front in Efficiency and Economy

HARRIS HEAVY PRESSURE

"The Babbitt Metal Without a Fault," is guaranteed to give EXCELLENT SERVICE. It will not crack or squeeze out. It will run cool at any speed. It is copper coated and copper hardened. It is best for all general machinery bearings. Order a box from our nearest factory.

It is Made in Canada. What We Make We Guarantee.

We Manufacture All Grades of Babbitt Metals.

THERE'S No Better Proof of the worth of Spartan Belting than the work it is doing on difficult quarter-turn drives.

The unusual pliability of Spartan Leather enables the belting to operate successfully on short centres—hugging the pulleys tightly, thereby transmitting maximum power most economically on the hardest quarter-turn drives.

To insure highest efficiency, Spartan-equip your hard drives.

FIRE BRICK

Differs in Quality and Variety

For instance, a certain quality or kind of brick that gives satisfaction when used in a Refuse Burner, may show up poorly if used in a Dutch Oven.

It all depends on getting the right kind and the right quality for your particular needs.

Just tell us what you want it for, and we'll send a fire-brick that was made for that very purpose.

We Manufacture the Following Well-Known Brands

"Elkco Special" "Elk Steel," "St. Marys," "Keystone" and "Rotex"

THE COST OF BOILER PROTECTION

is about 3⅓ CENTS PER DAY after installing a

National Boiler Seam Protector

Which is Guaranteed for 2 years

With National Boiler Seam Protectors Fire Cracks, Mud Cracks, Leaks cannot occur.

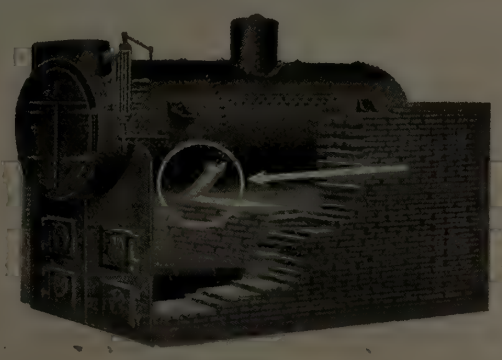
If your Boiler is Leaky, after caulking up, she will always remain dry thereafter.

Your Boiler is protected under all conditions of temperature.

This protection is past the experimental stage, and is in use by the leading firms in the United States and Canada, a few of names as under:

Carnegie Steel Co., Pittsburgh, Pa.
Dayton Lumber Company, Dayton, Ohio.
Chickasaw Milling Company, Chickasaw, Ohio.
Lufkin Land and Lumber Company, Lufkin, Tex.
Frost-Johnson Lumber Company, Campi, La.
Standard Oil Company, Shelby Hook, N.J.
Borden Condensed Milk Company, New York, N.Y.
National Bridge Company, Longue, Point, P.Q.
Montreal Locomotive Company, Montreal, Que.
Dominion Copper Products, Montreal, P.Q.
Howard Smith Paper Mills, Beauharnois, P.Q.
Montreal Cotton Mills, Valleyfield, P.Q.
Dominion Iron and Steel Company, Sydney, N.S.

There are hundreds of other firms who realize Protection is the biggest money-saver.



Position of Protector when attached to Seam of Boiler.

Without the National Boiler Seam Protector no boiler maker will guarantee a boiler from fire cracking.

No repairs are guaranteed after caulking.

No patch is guaranteed not to leak at the seam on account of new metal being joined to old.

No Boiler is unsusceptible to fire cracks or leaks, whether new or old.

EXPRESSIONS OF LEADING BOILER INSPECTORS AND ENGINEERS

Prominent Government Inspector—It should be on every R. T. Boiler, new or old, as it fills a long-felt want.

Consulting Engineer—There is no doubt as to its merits, and will recommend it to be adopted on all boilers under my supervision.

Factory Superintendent—Our cost in boiler repairs has been enormous, not counting necessity of shutting down. This Protector we have been wanting for some time and will have it put on every boiler where it can be attached.

Now it is up to you.

Is not Protection and Prevention better than Risk?

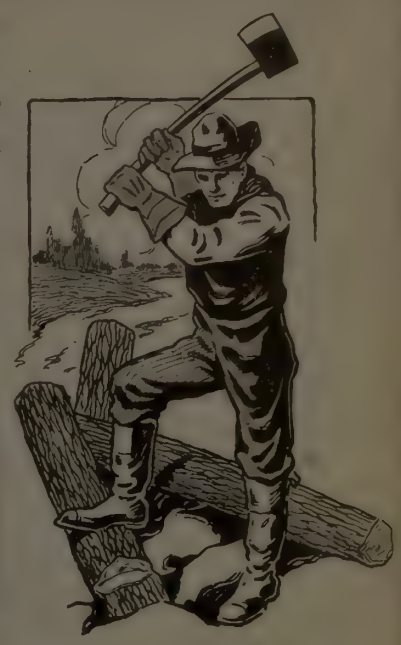
In the Great Lumber Camps "Asbestol" Gloves and Mittens are popular with every man



Made so thoroughly good that the lumberman can enjoy comfort and perfect hand protection on the coldest winter days. "ASBESTOL" Gloves and Mittens resist the effects of snow and hard wear. No other glove or mitten will give the wonderful service of "ASBESTOL."

ASBESTOL REG. IN U.S PAT. OFF.
EISENDRATH'S CELEBRATED HORSE HIDE **Gloves and Mittens**

LUMBERMEN, LISTEN!

Next time you want gloves or mittens that will give you the greatest service and comfort—and remain soft and pliable at all times—insist on "ASBESTOL."

Don't accept any substitute, because there is none other that will serve you like "ASBESTOL." There are many styles in both gloves and mittens, and you can get them from your local dealer.

"ASBESTOL" is the best value in a good work glove that money can buy. It will protect your hands and your pocket book, too.

EISENDRATH GLOVE COMPANY

2001 Elston Ave., CHICAGO

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

LOG JACK, No. 1

Sawmill Machinery

The Waterous Twin Circular Saw

in conjunction with the Kendall Circular Gang presents the cheapest way of turning small logs into merchantable lumber.

Points every man interested in this great industry should note and remember.

THE TWIN CIRCULAR consists of two independently driven saw frames, carried on planed iron slides upon which they are adjustable, to permit cutting a cant as narrow as 4 inches or to a width of 12 inches.

FRAME CASTING is in one piece with the bearing cast solid with the frame to make mandrel alignment a certainty. The saw frames are adjustable by rack and pinion and controlled by a hand wheel which gives rapidity of movement with a minimum of effort and no possibility of a shift during cutting.

SAWS are 42″ in diameter and run at 700 R.P.M.

MANDRELS measure 3,7/16 inches diameter and carry a 20″ x 13″ pulley.

Waterous

BRANTFORD, ONTARIO, CANADA

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 30c per lb., Fort William and East; West of Fort William 35c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, 65c per lb.; West of Fort William, 70c, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

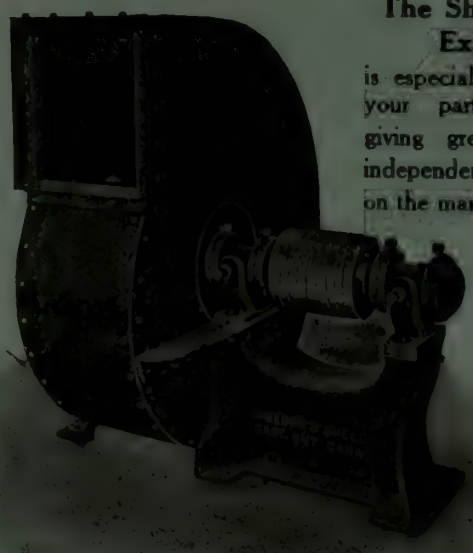
HOYT METAL CO., Toronto, Canada

Have factory and office at Eastern Avenue and Lewis Street, Toronto, Canada

Factories also at:— New York, N. Y. London, Eng. St. Louis, Mo.

Planing Mill Improvements

Every Manufacturer in the Lumber Industry realizes that to be "up-to-date" their Factory should be installed with **Shaving Exhaust Fans.**



The Sheldon Shaving Exhaust Fan

is especially designed to suit your particular requirements giving greater efficiency and independence than any other on the market.
